Energy Research Abstracts

Abstracts 25477–28218

Office of Scientific and Technical Information
UNITED STATES DEPARTMENT OF ENERGY

The Office of Scientific and Technical Information

The Office of Scientific and Technical Information (OSTI) in Oak Ridge, Tennessee, provides direction for the Department of Energy's scientific and technical information (STI) program and maintains a centralized base of support to assist Departmental elements in planning, developing, and implementing STI activities. DOE-originated and worldwide literature and software on advances in subjects of interest to DOE researchers is collected, processed, and disseminated using computerized databases, publications, and other media.

This information collection containing over three million citations represents a major national resource of scientific and technical information. In addition to information acquired from DOE and its contractors, DOE acquires information through its international partnerships with the International Energy Agency's Energy Technology Data Exchange (ETDE), a consortium comprised of members from Europe, Japan, Canada, and the United States; the International Atomic Energy Agency's International Nuclear Information System, representing 80 countries; bilateral agreements with foreign governments; exchange agreements with other U.S. government agencies; and contracts with private information organizations and professional societies.

The subject scope of this information extends beyond energy, covering basic scientific studies in such areas as radiology, atomic and nuclear physics, radiation and nuclear chemistry, superconductivity, supercomputers, the environment, radioactive waste management, nuclear medicine, and arms control.

Major DOE databases are available within the United States through DIALOG Information Services and STN International and outside the United States through formal governmental exchange agreements. DOE and DOE contractor offices can access the databases online through the Integrated Technical Information System (ITIS) maintained by OSTI.

Energy Research Abstracts

Coverage

Energy Research Abstracts (ERA) provides abstracting and indexing coverage of all scientific and technical reports and patent applications originated by the U.S. Department of Energy, its laboratories, energy centers, and contractors, as well as theses and conference papers and proceedings issued by these organizations in report form. Audiovisual materials, computer media (magnetic tapes, diskettes, etc.), and engineering drawings are included in this definition. *ERA* also covers other energy information prepared *in report form* by federal and state government organizations, foreign governments, and domestic and foreign universities and research organizations, *provided* that the full text of the document has been received by OSTI. Foreign report information is obtained through the International Energy Agency's 14-nation Energy Technology Data Exchange, the International Atomic Energy Agency's International Nuclear Information System, or nation-to-nation agreements. The purpose of this publication is to announce documents produced or obtained by DOE that are not so readily available as journal articles, books, or patents.

Scope

The scope of *ERA* encompasses DOE's research, development, demonstration, and technology programs resulting from its broad charter for energy sources, supplies, safety, environmental impacts, and regulation.

The citations presented in *ERA* are available for online searching as records within the Energy Science and Technology Database (EDB). The current-year records are available on the Integrated Technical Information System (ITIS).

Availability

DOE and DOE contractors who have OSTI deposit accounts can obtain *ERA* (regular issues and annual indexes) from the Office of Scientific and Technical Information, P.O. Box 62, Oak Ridge, TN 37831, Attention: Information Services. For further information, call (615)576-8401. *ERA* is also available at authorized GPO Depository Libraries. (List is provided on the inside back cover.)

ERA (regular issues and annual indexes) is available to the public on a subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Managing Editor, Doris M. Henline
Technical Editor, Milton O. Whitson

Information Sources

The citations presented in *Energy Research Abstracts* are a subset of the worldwide energy information provided to the Office of Scientific and Technical Information (OSTI) through exchange agreements with foreign sources and through exchanges or contracts with U.S. organizations.

The **Energy Technology Data Exchange (ETDE)** was established by the International Energy Agency to promote cooperation among members in conducting appropriate energy-related research and development programs through the development of a formal central information sharing system. In accomplishing the objectives of the ETDE, members select, abstract, and index relevant research information published in their countries in accordance with Exchange standards. OSTI serves as the central receiving and processing center for this information, which it then disseminates to national centers in the participating countries. The following countries are currently members of the ETDE:

- Canada
- Denmark
- Finland
- France
- Federal Republic of Germany
- Italy
- Japan
- The Netherlands
- Norway
- Spain
- Sweden
- Switzerland
- United Kingdom
- United States

The **International Nuclear Information System (INIS)** was established to promote the exchange of information on nuclear science and technology. Its operation is similar to that of the ETDE, with the INIS Secretariat being located in Vienna, Austria. Currently, 79 countries and 15 international organizations are members of INIS. OSTI serves as the INIS national center for the United States.

In the exercise of its rights and responsibilities under the agreements to which it is a party, the **Office of Scientific and Technical Information** both receives information from the above sources and submits U.S.-produced information to them. In addition to materials generated by the Department of Energy, this U.S.-produced information is gathered from other government agencies as well as under contract with private information processing companies. All input is computer processed and entered into a database for online retrieval. The database serves as well for the production of numerous OSTI publications.

How To Read A Citation

The principal data elements included in these citations are:

1. **Abstract number** within volume.
2. **Report number** identification for report-type literature.
3. **Title and subtitle** (non-English title may appear in parentheses, if applicable).
4. **Author(s).** First 10 names in the data record are printed, then "et al." is listed.
5. **Author affiliation.** Only first one is listed, in parentheses after author(s) to which it applies.
6. **Collaboration,** if present.
7. **Corporate author(s)** identifying corporation responsible for document.
8. **Date of publication.** If not known, a processing date is in brackets.
9. **Number of pages** or page range. Prices are based on total pages unless special pricing applies.
10. **Language** of document if non-English.
11. **Monograph title** if citation is an analytic (part, chapter, or paper) of a larger monograph.
12. **Sponsoring organization.**
13. **Contract or grant number.**
14. **Secondary identifying number;** may be a conference number.
15. **Conference title, location, and date,** if applicable.
16. **Order number.** The "DE" order number may be used for ordering from NTIS or OSTI, as appropriate. The "TI" prefix is valid only at OSTI.
17. **Sources of availability** from which a copy of the document may be obtained; usually appear as abbreviations. (See information on following page.)
18. **Drop note** or explanatory statement.
19. **Abstract.**
20. **Subject descriptors.** Listed only if no abstract or only a brief statement is included.

54 (DOE/ER/60888-1-Vol.1, pp. 115-117) **Investigation of air pollution in house due to use of various fuels.** Luo, Dayu (Chengdu Sanitation (China)). Canada Mortgage and Housing Corp., Ottawa, ON (Canada). 1990. (CONF-900724-Vol.1: Indoor Air '90: 5th international conference on indoor air quality and climate, Toronto (Canada), 29 Jul - 3 aug 1990). In Indoor air '90: The fifth international conference on indoor air quality and climate. Volume 1: Final report. 786p. Order Number DE90017786. Source: NTIS.

Air pollution in houses caused by combustion of coal is more serious than that by combustion of natural gas and methane (primarily by SO_2 and NO_2). The gas concentration after cooking is higher than that before cooking, and it is higher in kitchen than in bedroom and outdoor. There were mutations in the extract from TSP in $30m^2$ air in the bedroom, kitchen and outdoor, where coal and natural gas were used. The supernatant saliva activity of children whose family uses coal is significantly lower than that of pumping streams.

How To Order from the Availability Sources

TO OBTAIN A REPORT

Report literature, usually identified by an alphanumeric identifier at the beginning of a citation, is available from the sources listed in the citation (see example of element 2 on page iii). Often the sources are listed as abbreviations. Corresponding addresses are provided at right from which documents with these abbreviations may be ordered. When "OSTI" is given, **DOE and DOE contractors may order these documents from OSTI.** (However, check with your library or information organization which may require that orders go through them to OSTI.) OSTI prices are based on total pages unless special pricing applies. The public should order from NTIS or from one of the other agencies listed in the citation. NTIS price codes may continue to appear in some records. To expedite processing, an order form is provided in the back of this publication. NOTE: The order numbers provide quicker access for report ordering. Use the order number where possible.

How To Use the Indexes

Five indexes are provided for approaching the content of each issue of *Energy Research Abstracts.* Descriptions of entries in these indexes follow.

Corporate Author Index
The corporation, organization, or institution responsible for the issuance of the document is listed in this index. The entries are arranged alphabetically and provide the title and citation number of the reference. For example, the listing for the "Report" sample citation would appear as shown at right.

Wisconsin Univ., Madison (USA). Dept. of Physics
[Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)
Wisconsin Univ., Madison (USA). Lab. of Genetics
Organization of the R chromosome region in maize: Final progress report, June 1, 1983–May 31, 1986, 15:18255 (R;US)

Personal Author Index
Each author's name listed on a document cited in this issue is indexed. An index entry provides title and citation number; for secondary and other names, a cross-reference is given to the primary author name where the full index entry is located.

Hadley, D.L., *See* Lee, A.D., 15:17651
Haeberli, W., [Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)

Subject Index
This index lists the main subject descriptors assigned to each record by indexing professionals. A secondary or qualifier term is used where necessary to describe materials, objects, and processes. Document titles may be enhanced with additional informative phrases where necessary. An excerpt from this index appears at right.

HYDROGEN ISOTOPES
See also DEUTERIUM
HYDROGEN 4
TRITIUM
Neutron-Rich Isotopes
Study on the strong neutron-rich nuclei of lightest elements, 15:18686 (RA;SU;In Russian)

Contract Number Index
DOE technical reports are listed by contract number. Each entry also provides the primary corporation or organization cited for that contract number. A typical entry is shown.

FG02-88ER40438 **Wisconsin Univ., Madison (USA). Dept. of Physics**
15:18494 DOE/ER/40438–T1
FG02-88ER60664 **Rogers and Associates Engineering Corp., Salt Lake City, UT (USA)**

Report Number Index
Technical report literature is indexed by the alphanumerical identifier of the report. Patent documents and conferences are included for convenience. Each entry lists the citation number, the source of availability of the document, an indicator of presence at a GPO depository library, order number, and distribution category. A typical entry is:

DOE/ER/40438–T1	15:18494	NTIS, OSTI	E 1.99: DE89007246	MF-411

Subject Contents

The subject content of *Energy Research Abstracts* is arranged as shown below. The two-digit and four-digit category numbers printed here illustrate the category number assignment used in the database records.* The following list includes all of the 38 first-level and the 313 second-level categories. Because each issue of *ERA* publishes citations only for those documents announced during the past semimonthly period, some subject categories may not be present in every issue.

Numerical Listing of Categories

01 COAL LIGNITE, AND PEAT
- 03 Preparation
- 04 Processing
- 05 Products and By-Products
- 06 Properties and Composition
- 08 Waste Management
- 09 Environmental Aspects
- 10 Reserves, Geology, and Exploration
- 20 Mining
- 30 Transport, Handling, and Storage
- 40 Combustion
- 50 Economic, Industrial, and Business Aspects
- 60 Health and Safety
- 70 Legislation and Regulations

02 PETROLEUM
- 02 Reserves, Geology, and Exploration
- 03 Drilling and Production
- 04 Processing
- 05 Products and By-Products
- 06 Health and Safety
- 07 Economic, Industrial, and Business Aspects

Energy Research Abstracts

01 COAL, LIGNITE, AND PEAT

0103 Preparation

Refer also to citation(s) 25567, 25570

25477 (DOE/PC/79890–T1) **Ultrasonic ash/pyrite liberation: Final technical report.** Yungman, B.A.; Buban, K.S.; Stotts, W.F. CoaLiquid, Inc., Louisville, KY (United States). Jun 1990. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79890. Order Number DE93013529. Source: OSTI; NTIS; GPO Dep.

The objective of this project was to develop a coal preparation concept which employed ultrasonics to precondition coal prior to conventional or advanced physical beneficiation processes such that ash and pyrite separation were enhanced with improved combustible recovery. Research activities involved a series of experiments that subjected three different test coals, Illinois No. 6, Pittsburgh No. 8, and Upper Freeport, ground to three different size fractions (28 mesh x 0, 200 mesh x 0, and 325 mesh x 0), to a fixed (20 kHz) frequency ultrasonic signal prior to processing by conventional and microbubble flotation. The samples were also processed by conventional and microbubble flotation without ultrasonic pretreatment to establish baseline conditions. Product ash, sulfur and combustible recovery data were determined for both beneficiation processes.

0104 Processing

Refer also to citation(s) 25569, 25579, 25925, 25943, 26093, 26094, 26095, 26096, 26097, 26098, 26099, 26100, 26101, 26102, 26105, 26106, 26107

25478 (CONF-890902–30) **Use of dispersed catalysts for coal liquefaction.** Hirschon, A.S.; Wilson, R.B. Jr. SRI International, Menlo Park, CA (United States). [1989]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79936 ;FG22-85PC80906. From 198. national meeting of the American Chemical Society (ACS); Miami, FL (United States); 10-15 Sep 1989. Order Number DE93012938. Source: OSTI; NTIS; GPO Dep.

We have briefly explored the use of dispersed catalysts for conversion of an Illinois No. 6 coal into soluble products. We compared both supported and non-supported catalysts and found that the non-supported catalysts gives superior conversions. The non-supported catalysts were impregnated into the coal by use of either aqueous metal salts or organic solutions of organometallic complexes. The organometallic precursors were found to be exceptionally active and provide the greatest yields of toluene soluble products. Our key to effective dispersed catalysts is the use of a soluble sulfido complex that does not require high temperature activation.

25479 (DOE/ER/13616–7) **Coal liquefaction model compounds: Progress report.** Gajewski, J.J.; Gilbert, K.E. Indiana Univ., Bloomington, IN (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER13616. Order Number DE93017057. Source: OSTI; NTIS; GPO Dep.

This progress report is divided into sections dealing with tetralin pyrolysis, chroman pyrolysis, solvent effects on reactions, pi conjugated biradical, and molecular mechanics of organometallic systems. Proposals are given as well as current progress.

25480 (DOE/MC/24267–3330) **Development of an advanced, continuous mild gasification process for the production of co-products technical evaluation: Final report.** Ness, R.O. Jr.; Runge, B.; Sharp, L. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. Nov 1992. 247p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-87MC24267. Order Number DE93000267. Source: OSTI; NTIS; GPO Dep.

The University of North Dakota Energy and Environmental Research Center (EERC) and the AMAX Research and Development Center are cooperating in the development of a Mild Gasification process that will rapidly devolatilize coals of all ranks at relatively low temperatures between 930° and 1470°F (500°and 800°C) and near atmospheric pressure to produce primary products that include a reactive char, a hydrocarbon condensate, and a low-Btu gas. These will be upgraded in a "coal refinery" system having the flexibility to optimize products based on market demand. Task 2 of the four-task development sequence primarily covered bench-scale testing on a 10-gram thermogravimetric analyzer (TGA) and a 1 to 4-lb/hr continuous fluidized-bed reactor (CFBR). Tests were performed to determine product yields and qualities for the two major test coals-one a high-sulfur bituminous coal from the Illinois Basin (Indiana No. 3) and the other a low-sulfur subbituminous coal from the Powder River Basin (Wyodak). Results from Task 3, on product upgrading tests performed by AMAX Research and Development (R&D), are also reported. Task 4 included the construction, operation of a Process Research Unit (PRU), and the upgrading of the products. An economic evaluation of a commercial facility was made, based on the data produced in the PRU, CFBR, and the physical cleaning steps.

25481 (DOE/MC/24267–3331) **Development of advanced, continuous mild gasification process for the production of co-products addendum to technical evaluation: Final report.** North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. Nov 1992. 149p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-87MC24267. Order Number DE93000268. Source: OSTI; NTIS; GPO Dep.

This report contains the material balance data for Wyodak, Indiana No. 3, and Cannelton coals that were tested in the mild gasification program. Data include tests conducted using the 1- to 4-lb/hr continuous fluid-bed reactor (CFBR) and the 100-lb/hr Process Research Unit (PRU). All raw analysis data were reduced to calculate product yields as a percentage of the product mass divided by the maf coal feed. The material closure was then determined, and losses were assigned to one or a combination of the three product streams: char, condensate (includes condensed steam), and gas. Mass was added proportionally to each constituent of the stream until the closure was 100%.

25482 (DOE/METC–92/6128-Vol.1, pp. 111-114) **Catalytic gasification fundamentals.** Heinemann, H. (Lawrence Berkeley Laboratory, CA (US)); Somorjai, G.A. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. DOE Contract AC03-76SF00098. In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The major purpose of this project is to find catalysts which will permit steam gasification of carbonaceous materials at reasonable rates and at lower temperatures than currently practiced. Rapid catalyst deactivation must be avoided. An understanding of the catalytic mechanism is necessary to provide leads toward this aim.

25483 (DOE/METC–92/6128-Vol.1, pp. 115-118) **Production of mild gasification coproducts.** Horne, D.A. (SGI Fuels, Inc., La Jolla, CA (US)). This project is exploring the technical and economic feasibility of using two medium- to high-temperature processes for cleaning coal gas prior to combustion in a gas turbine used for power production. A zero-emissions process for converting a mixture of hydrogen sulfide and carbon dioxide to sulfur and synthesis gas is also under study. In the medium-temperature process, coal gas is scrubbed with a solution of copper sulfate, which forms the insoluble sulfide and removes hydrogen sulfide from the high-pressure gas at its adiabatic saturation temperature. CuS would be oxidized with ferric ion to regenerate the original sulfate and for elemental sulfur. In the high-temperature process the coal gas would pass through a nearly-isothermal, moving bed of calcium carbonate that would serve to remove particulates (by filtration), hydrogen chloride and hydrogen sulfide (by chemisorption), and ammonia (by catalysis). The objective of this research is to define the temperature at which these goals can be realized at a given pressure. Preliminary calculations indicate a probable range for the temperature of 650° to 900°C, about 100° to 400° below the outlet temperature of most gasifiers. In the course of experiments on the sorption of hydrogen sulfide from gases containing carbon dioxide it was discovered that a reaction producing elemental sulfur occurs. The reaction products also include carbon monoxide and hydrogen. Sulfur formation is favored by high temperature, low pressure and a high CO_2/H_2S ratio. Since unreacted CO_2 and H_2S could be recycled and there would be no tail-gas stream, a process based on this chemistry could lead to an emissions-free alternative to conventional Claus technology. A study is currently underway to determine the kinetics of the key reaction steps and to evaluate the process economics.

25485 (DOE/METC–92/6128-Vol.1, pp. 143-153) **Production of hydrogen and coproducts from coal.** Hauserman, W.B. (Univ. of North Dakota, Grand Forks (US)). USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The purpose of this program at the Energy and Environmental Research Center (EERC) is to explore catalytic effects of various salts and minerals on the reaction rates and product yields during coal gasification, primarily with respect to hydrogen and methane, for potential fuel cell use. The ultimate objectives are to identify the most effective and economic additives to maximize reaction rates, thus minimizing the required capital investment per throughput capacity.

25486 (DOE/METC–92/6128-Vol.1, pp. 165-173) **Coal ash behavior in reducing environments.** Erickson, T.A. (Univ. of North Dakota, Grand Forks (US)); Steadman, E.N.; Brekke, D.W.; Folkedahl, B.C.; Tibbetts, J.E.; Nowok, J. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The objective of the Coal Ash Behavior in Reducing Environments (CABRE) program is to advance the knowledge of ash behavior in coal gasification systems; this knowledge will help provide the tools needed to operate advanced coal utilization systems efficiently with a minimum of operational problems associated with ash properties. The program approach is to use carefully controlled, laboratory-scale gasification experiments coupled with detailed analysis of the materials involved to determine the critical fundamental mechanisms of ash behavior in coal gasification systems.

25487 (DOE/METC–92/6128-Vol.1, pp. 189-194) **Selection of non-absorbing alkali components.** Lee, S.H.D. (Argonne National Laboratory, IL (US)); Natesan, K.; Swift, W. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The principal objective of this work is to identify metallic material(s) that will not adsorb alkali vapors for use in alkali sampling lines and/or process component materials for advanced coal utilization systems. Also being sought are a better understanding of the alkali adsorption mechanism of metallic materials and their behavior under combustion off-gas and gasification fuel gas environments.

25488 (DOE/METC–92/6128-Vol.1, pp. 195-204) **Advanced lightweight ceramic candle filter module.** Zievers, J.F. (Industrial Filter & Pump Mfg. Co., Cicero, IL (US)). USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

Vacuum formed aluminosilicate fiber has often been post-treated to add strength and density. At high operating temperatures it's material strength rivals that of costly alloys. Using relatively inexpensive materials, service operating temperatures of up to 2730°F (1500°C) can be realized. After wrestling with the engineering problems and the manufacturing costs of alloy tubesheets at elevated temperatures, Industrial Filter & Pump Mfg. Co. and Universal Porosics, Inc. reached an agreement for joint development of light weight, alternative (ceramic) structural materials. After several years, a family of products trademarked Fibro™, were developed from vacuum formed alumino silicate fibers. The basic formed pieces are post treated for additional strength and density. The finished raw product is then fire cured to produce the Fibro family of structural ceramics. A combination of these Fibro materials has been in operation for 18 months in a 4000 ACFM filter at temperatures of up to 1830°F (1000°C) to verify the suitability of an "all ceramic" hot gas filter system.

25489 (DOE/METC–92/6128-Vol.1, pp. 205-217) **Low-cost ceramic membranes and supports for gas separation.** Goldsmith, R.L. (CeraMem Corp., Waltham, MA (US)). USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The objectives of this program are to: (1) Develop a passive, highly selective, molecular sieve membrane capable of purifying coal process conversion gases at temperatures over 600°C. (2) Fabricate and determine the performance characteristics of such a membrane based on a practical (i.e., low cost, high surface area) support module.

25490 (DOE/METC–92/6128-Vol.1, pp. 221-229) **Bench-scale testing and evaluation of the direct sulfur recovery process.**

McMichael, W.J. (Research Triangle Institute, Research Triangle Park, NC (US)); Agarwal, S.K.; Chen, D.H.; Hopper, J.R. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The objective of this work is to demonstrate on a bench-scale the Direct Sulfur Recovery Process (DSRP) for up to 99 percent or higher recovery of sulfur (as elemental sulfur) from regeneration off-gases and coal-gas produced in integrated gasification combined cycle (IGCC) power generating systems. Fundamental kinetic and thermodynamic studies will also be conducted to explain the mechanism of DSRP reactions. The goal of the project is to advance the DSRP technology to the point where industry is willing to support its further development.

25491 (DOE/METC–92/6128-Vol.1, pp. 230-239) **Enhanced durability of high-temperature desulfurization sorbents for moving-bed applications.** Ayala, R.E. (GE Corporate R&D, Schenectady, NY (US)); Gal, E.; Gupta, R.P. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The objective of this project is to develop chemically reactive and mechanically durable zinc ferrite and zinc titanate sorbent formulations that are suitable for moving-bed, high-temperature, coal gas desulfurization processes. Zinc ferrite formulations were studied under the Base program; novel mixed-metal oxide formulations, particularly zinc titanates, are being studied in the current Option 2 program.

25492 (DOE/METC–92/6128-Vol.1, pp. 240-252) **Enhanced durability of desulfurization sorbents for fluidized-bed applications.** Gupta, R.P. (Research Triangle Institute, Research Triangle Park, NC (US)). USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The objectives of this project are to identify and demonstrate methods for enhancing long-term chemical reactivity and attrition resistance of zinc ferrite and zinc titanate sorbents to be employed for desulfurization of hot coal-derived gases in a high-temperature, high-pressure (HTUP) fluid-bed reactor. The sorbent formulation specified for study during the base period of this project was zinc ferrite. Zinc titanate sorbents are being studied under two options to the base contract. Specific objectives of the zinc titanate sorbent development work are the following.

25493 (DOE/METC–92/6128-Vol.1, pp. 253-262) **In situ real-time species analysis of particulates and deposits.** Ottesen, D.K. (Sandia National Labs., Livermore, CA (US)). USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

This project is supported by the AR&TD Instrumentation and Diagnostics Program to develop optical diagnostic techniques for real-time in situ species analysis of both particles and surfaces in advanced coal-based power systems. The goal of this research is to apply these optical methods: (1) to the development and testing of ceramic materials for use as hot gas cleanup filters; and (2) as a real-time monitor for the composition of both gas and particles in clean, hot gas process streams.

25494 (DOE/METC–92/6128-Vol.1, pp. 263-279) **Sensitivity of hot gas desulfurization on IGCC cost of electricity.** Chen, H.T. (Gilbert/Commonwealth, Inc., Reading, PA (US)); Klett, M.G.; Rutkowski, M.D. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The objectives of these studies were (1) to conduct economic sensitivity analyses to highlight the overall effect of varying sulfur control and sulfur by-product parameters on the cost of electricity, and (2) to conduct a preliminary assessment of the comparative technical and economic characteristics of the moving bed and fluid bed hot gas desulfurization processes.

25495 (DOE/METC–92/6128-Vol.1, pp. 280-288) **Standleg moving granular bed filter development program.** Yang, Wen-Ching (Westinghouse Electric Corporation Science & Technology Center, Pittsburg, PA (US)); Smeltzer, E.E. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. DOE Contract AC21-91MC27259. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The objectives of the base contract are: To identify and define the barrier technical issues associated with the development of the Standleg Moving Granular Bed Filter (SMGBF). To devise a test plan to resolve the barrier technical issues. To design, procure, and install the component test facilities. To conduct tests in accordance to the test plan. To develop conceptual designs of the SMGBF system integrated into a commercial-scale PFBC and IGCC plants. To describe the results and to provide an assessment of the success of the program in resolving the barrier technical issues.

25496 (DOE/METC–92/6128-Vol.1, pp. 289-296) **Moving granular bed filter development program.** Haas, J.C. (Combustion Power Company, Menlo Park, CA (US)); Eshelman, M.B. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

Efforts to design and operate coal-fired gas turbines plants in advanced gasification and combustion power cycles have been intensified in recent years. These efforts, such as those carried out by Combustion Power Company in the early 1970's, have been plagued by turbine problems due to ash-ladened combustion gases. It is generally recognized that a hot gas cleanup train must be used before the gas turbine to remove the major portion of the particulate. Advantages are also evident for a filter system that can remove other coal derived contaminants such as sulfur and alkali. With most particulate and other contaminants removed, erosion and corrosion of turbine materials, as well as deposition of particles within the turbine, are reduced to acceptable levels.

25497 (DOE/METC–92/6128-Vol.1, pp. 297-314) **Thermal/chemical stability of ceramic cross flow filter materials.** Bachovchin, D.M. (Westinghouse Electric Corp. Science & Technology Center, Pittsburgh, PA (US)); Lippert, T.E.; Tressler, R.E.; McNerney, K.B. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The objectives of this program are to identify the potential long-term thermal/chemical effects that advanced coal-based power

generating system environments have on the stability of the ceramic cross flow filter materials, as well as to assess the influence of these effects on filter operating performance and life.

25498 (DOE/METC–92/6128-Vol.1, pp. 315-325) **Ceramic filters for removal of particulates from hot gas streams.** Goldsmith, R.L. (CeraMem Corp., Waltham, MA (US)). USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. DOE Contract FG02-90ER80896. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The primary goal of this Phase II SBIR program is to demonstrate the performance of a new ceramic filter in removing particulate matter from hot gas streams produced in advanced coal conversion processes. The specific objectives are threefold: (1) Development of full size ceramic filters suitable for hot gas filtration; (2) Demonstration of ceramic filters in long term (ca. 1000 hrs) field trials; and (3) Development of full-scale hot gas filter system designs and costs.

25499 (DOE/METC–92/6128-Vol.2, pp. 329-337) **Development of an electrochemical hydrogen separator.** Abens, S. (Energy Research Corp., Danbury, CT (US)); Fruchtman, J.; Kush, A. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

The objective of this program is to develop an electrochemical hydrogen separation device for cost-effective hydrogen recovery from various dilute hydrogen streams. Potential applications include high purity hydrogen recovery from oxygen and air blown gasifiers, as well as hydrogen-lean streams such as a carbonate fuel cell anode exhaust. Other potential applications include recovery of hydrogen used to mitigate corrosion in boiling water reactors (BWRs). In the present program, the effect of design and operating parameters e.g. pressure, temperature, and H_2 recovery on EHS performance have been characterized in single subscale cells (25 cm^2 active area) and presented as a mathematical model. Full size (1000 cm^2) multi-cell-stack long term operation has also be demonstrated. Process conceptual design and economics for a potential application will be evaluated for the EHS and a competing technology.

25500 (DOE/METC–92/6128-Vol.2, pp. 338-345) **Hydrogen separation by ceramic membranes in coal gasification.** Gavalas, G.R. (California Institute of Technology, Pasadena (US)). USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

The general objective of this project is to develop inorganic membranes for separation of hydrogen from coal gas at high temperatures. The project includes the following tasks: (i) membrane development by chemical vapor deposition of dense silica layers within the pores of support tubes, (ii) membrane characterization, (iii) tests of membrane stability to extended operation in contact with a simulated coal gas, (iv) development of a model for combined shift reaction and membrane hydrogen separation, and (v) comparative economic analysis of membrane-based hydrogen production and a conventional process of hydrogen production from coal.

25501 (DOE/METC–92/6128-Vol.2, pp. 351-361) **Gas separations using ceramic membranes.** Lin, C.L. (Aluminum Company of America, Pittsburgh, PA (US)); Flowers, D.L.; Wu, J.C.S.; Smith, G.W.; Liu, P.K.T. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

In recent years, the use of ceramic membranes for high temperature gas separations has been gaining considerable attention. The objectives of this research and development effort are: (1) Evaluation of existing state of the art ceramic membranes with particular emphasis on material stability, product optimization and gas separation efficiency. (2) Development of mathematical models to simulate gas separations for a range of conditions encountered in coal off-gas cleanup operations and verification of results with experimental permeation and separation measurements at high temperatures (greater than 500°C) and high pressures (greater than 10 atm) using existing membranes. (3) Modifications of ceramic membrane to optimize and/or improve overall separation performance, and (4) For the purpose of process development and economic analysis, the performance of optimized products will be quantified under the proposed coal processing environments.

25502 (DOE/METC–92/6128-Vol.2, pp. 362-371) **A calcium oxide sorbent process for bulk separation of carbon dioxide.** Harrison, D.P. (Louisiana State Univ., Baton Rouge (US)); Silaban, A.; Narcida, M.; Han, C. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

The overall project is divided into two phases. Phase I, now complete, investigated the technical feasibility of a regenerable calcium sorbent-based process for the high-temperature, high-pressure (HTHP) separation of CO_2 from coal-derived gas. A high-pressure electrobalance reactor and microgram quantities of sorbent were used in this phase of the study. Favorable results led to continuation of the project into Phase II where a laboratory-scale fixed-bed reactor involving gram quantities of sorbent and with capability for product gas analysis is being used. The possibility of the simultaneous occurrence of the water-gas shift reaction and CO_2 separation is of particular interest in Phase II. Simultaneous reactions create the possibility of a direct, one-step process for producing hydrogen from coal-derived gas.

25503 (DOE/METC–92/6128-Vol.2, pp. 372-378) **Development of hollow-fiber catalytic-membrane reactors for high-temperature gas cleanup.** Ma, Yi H. (Worcester Polytechnic Institute, MA (US)); Moser, W.R.; Pien, Shyhing M. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). The goal of the project is to develop catalytic membrane reactors for IGCC gas cleanup at high temperatures and pressures. The objectives of this research and development effort are: (i) characterization of raw fibers and investigation of their permeability and thermal behavior, (ii) introduction of catalytic compounds on the hollow fiber and their characterization, and (iii) evaluation of catalytic membrane reactors for their performance in facilitating the decomposition of hydrogen sulfide in pure component and gas mixture systems.

25504 (DOE/METC–92/6128-Vol.2, pp. 379-384) **Development of ceramic membrane reactors for high temperature gas cleanup.** Roberts, D.L. (SRI International, Menlo Park, CA (US)); Way, J.D. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

The objective of this project is to develop high-temperature, high-pressure catalytic ceramic membrane reactors and to demonstrate the feasibility of using these membrane reactors to control gaseous contaminants in Integrated Gasification Combined Cycle (IGCC) systems. These catalytic membrane reactors will decompose hydrogen sulfide (H_2S) and ammonia (NH_3) and separate the reaction products. The reactors will be designed to operate in the hostile process environment encountered in IGCC systems, including temperatures ranging from 1,000 to 2,000°F and pressures from 200 to 1,000 psia. The research involves novel catalytic materials, modification of commercially available inorganic membranes, and the making of laboratory membrane reactors from these catalysts and modified membranes.

25505 (DOE/METC–92/6128-Vol.2, pp. 395-408) **Mechanical analysis of a cross flow filter.** Alvin, M.A. (Westinghouse Electric Corp. Science & Technology Center, Pittsburgh, PA (US)); Attaar, M.H. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

The objectives of this program are to improve the reliability, uniformity, and mechanical integrity of the cross flow filter through improved design, manufacturing, and quality assurance. The goal is to provide a cross flow filter that will endure the mechanical and thermal loads and stresses imposed during installation, startup, and operation (including pulse cleaning) at high temperature and high pressure which are indicative of advanced fossil power generation applications. This program provides the technology base for the development of the cross flow filter element including material properties, and supports the implementation of these filters into pilot plant and field demonstration facilities.

25506 (DOE/METC–92/6128-Vol.2, pp. 346-350) **High-temperature membranes for gas separation and gas cleanup.** Edlund, D.J. (Bend Research, Inc., OR (US)). USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

These two programs are directed at furthering the development of two metal-membrane-based processes for (1) economically producing pure hydrogen from the raw gasifier stream, and (2) cleanly and efficiently removing hydrogen sulfide from the hot gas stream. Both of these processes would be accomplished at 700°C to 800°C and are based on a novel hydrogen-permeable composite-metal membrane. Specific program objectives include (1) design, fabrication, and demonstration of pre-prototype membrane modules, (2) improving the membrane composition to increase the hydrogen flux, (3) evaluating membrane lifetime, and (4) conducting engineering and economic analyses of the processes.

25507 (DOE/METC–92/6128-Vol.2, pp. 385-392) **Facilitated transport ceramic membranes for high temperature gas cleanup.** Minford, E. (Air Products and Chemicals, Inc., Allentown, PA (US)); Quinn, R. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

The objective of this project is to demonstrate the feasibility of developing high temperature, high pressure, facilitated transport ceramic membranes to control gaseous contaminants in Integrated Gasification Combined Cycle (IGCC) power generation systems.

25508 (DOE/METC–92/6128-Vol.2, pp. 409-413) **Particulate technology issues.** Pontius, D.H. (Southern Research Institute, Birmingham, AL (US)); Bush, P.V. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

Advanced systems for power generation based on coal combustion or gasification will require effective particulate control both for protection of equipment in the gas stream and for compliance with environmental regulations. These new classes of systems will require efficient removal of particles from gas streams at high temperature and high pressure. Primary candidates for particulate control are various types of ceramic filter systems; however, the long-term effects of hot gases and fine particles on the structure and filtration effectiveness of potential filter materials require further study. Thermal gradients induced by pulse cleaning are also of concern. Long-term "patch tests" will be conducted on ceramic disks of the same materials used in the fabrication of ceramic candles and ceramic cross-flow filters. The primary issues to be addressed in these tests are the long-term physical, thermal, and chemical stability of the ceramic materials; long-term pressure drop and filtration characteristics of the ceramic filters; potential for irreversible blinding of filter elements; and long-term performance and reliability of auxiliary hardware, such as the tube sheet and pulse-cleaning systems. Each long-term patch test will require about 3 to 4 months of nearly continuous operation.

25509 (DOE/METC–92/6128-Vol.2, pp. 414-420) **The metered delivery of solids into pressure: A radically new machine concept.** Hay, A.G. (STAMET, Inc., Gardena, CA (US)). USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

This paper is the second published report on the continuing successful elaboration and embodiment of an entirely new patented machine concept for the continuous movement and accurately metered delivery of all sorts of particulate solids, wet or dry, into environments of ambient or differential fluid or mechanical pressure. It includes the first disclosure of the successful continuous, direct delivery of US power plant coal into 26 psi of gas pressure, which is itself an important milestone in a project for the continuing development of the system for very high pressure metered injection of solids. We call the device a "Rock Pump". More formally, it is the Firth Solids Pump System, after the inventor. Due to time constraints, camera-ready diagrams were not available at the time of publication. These diagrams are available free of charge by contacting Stephen Beer, Morgantown Energy Technology Center, Morgantown, West Virginia, 26507-0880, (304) 291-4040.

25510 (DOE/METC–92/6128-Vol.2, pp. 421-430) **Ion-exchange membranes for bulk separation of acid gases.** Pellegrino, J.J. (National Institute of Standards and Technology, Boulder, CO (US)); Giarratano, P. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

The overall goal of this program is to investigate the use of ion exchange membranes in the removal of acid gases during processing of natural gas or during production of H_2 from synthesis gas. As part of this goal we are running a field test of candidate membranes on a natural gas stream to obtain extended performance data on acid gas transport. Additionally we are working on strategies for increasing the productivity and lifetime of these types of membranes. The specific objectives include: Evaluate candidate membranes, carriers, solvents, treatments and the effects of process conditions for separation of the acid gases CO_2 and H_2S

from H_2, CO and CH_4. Develop mathematical models to guide experimental work and for interpretation of results. Construct and operate an extended-use test facility to evaluate the long term stability and productivity of various membrane forms relative to acid gases. Develop thin film composite membranes as a possible route to higher productivity and lower cost membranes. Develop preliminary process design and economic analysis for the use of these membranes in gas cleanup.

25511 (DOE/METC–92/6128-Vol.2, pp. 431-437) **High temperature hydrogen sulfide removal.** Copeland, R.J. (TDA Research, Inc., Wheat Ridge, CO (US)). USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). The objective of this Phase II Small Business Innovation Research (SBIR) contract is to develop and test a regenerable stannic oxide-based sorbent to remove H_2S from hot coal gases while producing sulfur as the only product. The detailed technical objectives in support of this are: (1) Develop mechanically strong and chemically inert support materials which will retain their properties through multiple absorption-regeneration cycles. (2) Develop mathematical models to predict the performance of large-scale systems from bench-scale results. (3) Test the durability of the best sorbent/support combinations. (4) Conduct a bench-scale proof of concept test with the best stannic-oxide sorbent.

25512 (DOE/METC–92/6128-Vol.2, pp. 438-447) **Comparative study of the reactions of metal oxides with H_2S and SO_2.** Sotirchos, S.V. (Univ. of Rochester, NY (US)). USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

The primary objective of this project is the investigation of the effects of pore structure on the capacity of porous metal oxides for removal of gaseous-pollutants from flue gases of power plants (SO_2) and hot coal gas (primarily H_2S). Porous calcines obtained from natural precursors (limestones and dolomites) and sorbents based on oxides of zinc, iron, and/or copper will be used as model systems in our experimental studies, which will include reactivity evolution studies and pore structure characterization using a variety of methods. Our work will focus on oxides that can react (sufficiently fast) both with SO_2 and H_2S. We intend to appropriately exploit the differences of the sulfidation and sulfation reactions (for instance, different molar volumes of solid products) to elucidate the dependence of the sorptive capacity of a porous sorbent on its physical microstructure.

25513 (DOE/METC–92/6128-Vol.2, pp. 448-455) **METC integrated bench-scale gasification and hot gas cleanup studies.** Rockey, J.M. (Morgantown Energy Technology Center, WV (US)); Kanosky, J.P.; Rutten, J. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

Integrated Gasification Combined Cycle (IGCC) power generation systems are emerging as potentially clean and economical coal-based power generation systems of the future. A key component of the IGCC system that can boost power plant efficiency is hot particulate and sulfur removal prior to electric generation. The Morgantown Energy Technology Center (METC) has an integrated gasification hot gas cleanup facility to develop hot particulate removal and desulfurization processes for IGCC systems.

25514 (DOE/METC–92/6128-Vol.2, pp. 456-468) **TGA studies on supported sorbents at elevated pressures.** Gasper-Galvin, L.D. (Morgantown Energy Technology Center, WV (US)); Gupta, R.P. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

The objective of the supported sorbents research at the Morgantown Energy Technology Center (METC) is to develop a hot gas desulfurization sorbent which will have superior attrition resistance, higher temperature capability, and increased sulfidation/regeneration cycle life, as compared to bulk metal oxide sorbents such as zinc ferrite and zinc titanate. Previous investigations of zeolite-supported sorbents at METC have been conducted at 205 kPa (15 psig). The purpose of this study was to use thermogravimetric analysis (TGA) to obtain information on the performance of zeolite-supported sorbents at a pressure which is similar to that expected in a commercial integrated gasification combined cycle (IGCC) plant.

25515 (DOE/METC–92/6128-Vol.2, pp. 469-478) **TGA characterization of char reactivity.** Shadle, L.J. (Morgantown Energy Technology Center, WV (US)); Wang, Yau-Hsin C. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

This is a report on the status and progress of studies to characterize the reactivities of coal char. The current experimental program was initiated to develop an empirical relationship that could describe the dependence of coal devolatilization rates and yields on coal particle sizes between 100 to 1,000 micrometers as part of the mild gasification program, in order to aid the conceptual design of a bench-scale reactor. The conceptual design comprised a fast fluidized-bed pyrolyzer in which the product char was to be burned in a fluidized-bed surge tank combustor prior to the solids recycle. The combustion reactivity of chars was measured following the devolatilization measurements. As a result, the combustion reactivity of various chars were determined as a function of particle size. The findings of the combustion reactivity measurements of coal chars are described in this report. The direct dependencies of particle size, coal type, and char preparation/generation heating rate and temperature are presented for combustion reactivities of chars.

25516 (DOE/METC–92/6128-Vol.2, pp. 479-497) **Trace contaminants in fixed-bed gasifier gas.** Grindley, T. (Morgantown Energy Technology Center. WV (US)); Gardner, T.H. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

A high-temperature, fixed-bed zinc ferrite, sidestream desulfurization unit has been utilized to study the desulfurization of hot gas from the METC 42-inch diameter, fixed-bed gasifier. Early investigations in 1983 (Grindley 1984) were during gasifier runs 101 to 104 and were concerned primarily with establishing the performance of regenerable desulfurization sorbents. In 1986, the sidestream unit was again operated during gasifier runs 105 through 107 and more detailed gas stream characterization was obtained. The purpose of this paper is to present the results of gas stream analyses sampled at the outlet of the gasifier and the inlet and outlet of the desulfurizer. The analyses were achieved by filtering particles from the hot gas and condensing water and tars from the filtered and unfiltered gases. Particles, condensates, and gases

were analyzed for sulfurous and nitrogenous compounds, halogens, trace metals, and various ionic species. The purpose for obtaining a detailed gas stream characterization is to aid in the study and design of hot gas purification concepts.

25517 (DOE/METC–92/6128-Vol.2, pp. 498-501) **Sulfur capture mechanisms.** Siriwardane, R.V. (Morgantown Energy Technology Center, WV (US)); Poston, J.A.; Woodruff, S.D. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

The Morgantown Energy Technology Center is currently involved in developing high-temperature cleanup for the integrated gasification combined cycle process. Solid sorbents are being employed to remove sulfur-bearing gases. Therefore, it is important to know the reaction mechanisms and kinetics of the interactions of the sulfur-bearing gases with sorbent materials, and the changes in elemental composition during reactions in order to develop novel sorbents or to unprove existing sorbents. In our previous work, the mechanisms of the reactions of CaO with SO_2/O_2, zinc titanate with H_2S/CO and H_2, and elemental changes in zinc copper ferrite during heating were investigated. The CaO reaction proceeds via $CaSO_3$, an intermediate, while in the zinc titanate reaction, $ZnSO_4$ was formed as an intermediate. Migration of copper to the surface and presence of copper in the +1 state was observed in zinc copper ferrite at 823K. in the present work, the characterization of fresh, sulfided, and regenerated zinc titanate sorbents, and the mechanism of sulfate formation during regeneration of zinc sulfide were investigated. X-ray photoelectron spectroscopy (XPS), scanning electron microscopy/electron dispersive analysis (SEM/EDS), and Fourier transform infra-red spectroscopy (FTIR) were used to analyze intermediates and products during the reaction.

25518 (DOE/METC–92/6128-Vol.2, pp. 502-510) **Studies of in-situ calcium-based sorbents in advanced pressurized coal conversion systems.** Katta, S. (M.W. Kellogg Company, Houston, TX (US)); O'Donnell, J.J. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

The overall objective of the project is to obtain experimental data on the reactions of calcium-based sorbents in gasification systems and to evaluate or develop kinetic models applicable to the commercial design of such systems. Both air-blown coal gasification systems and second generation fluid bed combustion systems (partial gasification) will be investigated, as well as subsequent stabilization of the solid wastes (calcium sulfide/ash) produced. More specifically, the objectives are to: Develop data on kinetics of in-situ desulfurization reactions, Study the effect of calcium on the kinetics of carbon conversion rate, Study kinetics of oxidation of CaS to $CaSO_4$, Develop and identify viable techniques to stabilize CaS, and Carry out further development work on most promising method and determine its commercial economics.

25519 (DOE/METC–92/6128-Vol.2, pp. 515-523) **Measurements and modeling of advanced coal conversion processes.** Serio, M.A. (Advanced Fuel Research, Inc., East Hartford, CT (US)); Hamblen, D.G.; Brewster, B.S. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

The overall objective of this program is to understand the chemical and physical mechanisms in coal conversion processes and incorporate this knowledge in computer-aided reactor engineering technology for the purposes of development, evaluation, design, scale up, simulation, control and feedstock evaluation in advanced coal conversion devices. To accomplish this objective, the study will: establish the mechanisms and rates of basic steps in coal conversion processes, incorporate this information into comprehensive computer models for coal conversion processes, evaluate these models, and apply them to gasification, mild gasification and combustion in heat engines.

25520 (DOE/METC–92/6128-Vol.2, pp. 550-561) **Development of an advanced, continuous mild gasification process for the production of co-products.** Im, Chang J. (Coal Technology Corp., Bristol, VA (US)); Henkelman, M.R.; O'Neal, G.W.; Wolfe, R.A. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

The objective of this project is to develop a continuous mild gasification process to convert highly caking coals to coal liquids, char and coke for near term commercial application. Coal liquids after fractionation can be blended with petroleum and used interchangeably with conventional fuels without modifications in gasoline and diesel engines. Char can be used as a carbon source in the production of ferro-alloys and in mini-mills. Coke can be produced by upgrading char through briquetting and calcining and for use in the steel industry foundries and blast furnaces. In a step beyond the scope of the project, the plan is to finance, design and construct, in a partnership with others, a plant to produce coal liquids, char and coke in the initial range of 250,000 tons/year.

25521 (DOE/METC–92/6128-Vol.2, pp. 562-570) **Scaleup of mild gasification to a process development unit.** Carty, R.H. (Institute of Gas Technology, Chicago, IL (US)); Saladin, N.; Mead, J.; Foster, H. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

The overall objective of this project is to develop the IGT Mild-Gasification (MILDGAS) process for near-term commercialization. The specific objectives of the program are to: design, construct, and operate a 24-tons/day adiabatic process development unit (PDU) to obtain process performance data suitable for further design scaleup; obtain large batches of coal-derived co-products for industrial evaluation; prepare a detailed design of a demonstration unit develop technical and economic plans for commercialization of the MILDGAS process.

25522 (DOE/METC–92/6128-Vol.2, pp. 583-595) **Current status of design and construction of ENCOAL mild gasification plant.** Siddoway, M.A. (ENCOAL Corp., Gillette, WY (US)); Coolidge, D.W. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

The design and construction of the ENCOAL demonstration plant was done on a fast track basis, that is, these activities were extensively overlapped. An overall plot plan of the work site for convenient reference is shown. Even though the design work had just started, field construction crews mobilized in early October, 1990. By the end of the year, all of the major underground foundations were done and the first silo was poured. Although activity slowed during the winter, by the spring of 1992, the feed coal and PDF silos had been completed. All underground piping and equipment foundations were also done.

25523 (DOE/METC–92/6128-Vol.2, pp. 596-605) **Gasification product improvement facility (GPIF).** Sadowaki, R.S. (CRS Sirrine Engineers, Inc., Greenville, SC (US)); Skinner, W.H.; Brown,

M.J. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.2: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 2.* 314p. Order Number DE93000229. Source: OSTI; NTIS.

The objective of this procurement is to provide a test facility to support early commercialization of advanced fixed-bed coal gasification technology for electric power generation applications. The proprietary CRS Sirrine Engineers, Inc. PyGas™ staged gasifier has been selected as the initial gasifier to be developed under this program. The gasifier is expected to avoid agglomeration when used on caking coals. It is also being designed to crack tar vapors and ammonia, and to provide an environment in which volatilized alkali may condense onto alumino silicates in the coal ash thereby minimizing their exiting with the hot raw coal gas and passing through the system to the gas turbine.

25524 (DOE/METC/C–93/7066) **Simulation of coal conversion in a circulating fluidized bed.** Syamlal, M. (EG and G/Washington Analytical Services Center, Inc., Albuquerque, NM (United States)); O'Brien, T.J. USDOE Morgantown Energy Technology Center, WV (United States). [1993]. 23p. Sponsored by USDOE, Washington, DC (United States). (CONF-930347–1: 7. annual conference on clean and efficient combustion of fossil fuels and toxic wastes, Park City, UT (United States), 2-5 Mar 1993). Order Number DE93013485. Source: OSTI; NTIS; GPO Dep.

A computer code, based on a multi-phase hydrodynamic model, has been developed at the morgantown Energy Technology Center (METC) for the detailed simulation of gas and particle dynamics in coal conversion processes. The particles, like the fluidizing gas, are described as interpenetrating continua. Different particle types are treated as distinct phases. Coupled three-dimensional, transient, partial differential equations, representing the conservation of mass, momentum and energy for each phase, are solved by this code, in either Cartesian or cylindrical coordinates. Constitutive laws have been developed to account for the exchange of momentum between phases ("drag") and interphase energy transfer. The stress within the granular phase is determined by a formulation based on the kinetic theory and is characterized by a "granular temperature." Recently, species balance equations were added to the code, so that it now has the capability of describing chemical reactions. The code has been tested by simulating several circulating fluidized bed reactors which are being studied at METC. This paper presents a brief description of the capabilities of the code, with some emphasis on its relationship to other hydrodynamic codes used for the simulation of coal conversion reactors, and preliminary results of the simulation of a chemically active riser.

25525 (DOE/PC/79815–T2) **Bioechnology of indirect liquefaction: Final report.** Datta, R.; Jain, M.K.; Worden, R.M.; Grethlein, A.J.; Soni, B.; Zeikus, J.G.; Grethlein, H. Michigan Biotechnology Inst., Lansing, MI (United States). 7 May 1990. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88PC79815. Order Number DE93014484. Source: OSTI; NTIS; GPO Dep.

The project on biotechnology of indirect liquefaction was focused on conversion of coal derived synthesis gas to liquid fuels using a two-stage, acidogenic and solventogenic, anaerobic bioconversion process. The acidogenic fermentation used a novel and versatile organism, Butyribacterium methylotrophicum, which was fully capable of using CO as the sole carbon and energy source for organic acid production. In extended batch CO fermentations the organism was induced to produce butyrate at the expense of acetate at low pH values. Long-term, steady-state operation was achieved during continuous CO fermentations with this organism, and at low pH values (a pH of 6.0 or less) minor amounts of butanol and ethanol were produced. During continuous, steady-state fermentations of CO with cell recycle, concentrations of mixed acids and alcohols were achieved (approximately 12 g/l and 2 g/l, respectively) which are high enough for efficient conversion in stage two of the indirect liquefaction process. The metabolic pathway to produce 4-carbon alcohols from CO was a novel discovery and is believed to be unique to our CO strain of B. methylotrophicum. In the solventogenic phase, the parent strain ATCC 4259 of Clostridium acetobutylicum was mutagenized using nitrosoguanidine and ethyl methane sulfonate. The E-604 mutant strain of Clostridium acetobutylicum showed improved characteristics as compared to parent strain ATCC 4259 in batch fermentation of carbohydrates.

25526 (DOE/PC/79936–T1) **Low severity conversion of activated coal: Final report.** Hirschon, A.S.; Ross, D.S. SRI International, Menlo Park, CA (United States). Jan 1990. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79936. Order Number DE93012864. Source: OSTI; NTIS; GPO Dep.

The results suggest that coal contains regions with structural components significantly reactive under the hydrothermal environment. Although the specific mechanism for this process remains to be developed, this activity is reminiscent of findings in studies of accelerated maturation of oil shale, where hydrothermal treatment (hydrous pyrolysis) leads to the production of petroleum hydrocarbons. In line with what has been seen in the oil shale work, the pretreatment-generated hydrocarbons and phenols appear to represent a further or more complete maturation of some fraction of the organic material within the coal. These observations could have an impact in two areas. The first is in the area of coal structure, where immature, reactive regions have not been included in the structures considered at present. The second area of interest is the more practical one of conversions to coal liquids and pyrolytic tars. It seems clear that the hydrothermal pretreatment changes the coal in some manner that favorably affects the product quality substantially and, as in the CO/water liquefaction case, favorably affects the yields. The conversions of coals of lower rank, i.e., less mature coals, could particularly benefit in terms of both product quality and product quantity. The second portion of this project also shows important benefits to coal conversion technology. It deals with synthesizing catalysts designed to cleave the weak links in the coal structure and then linking these catalysts with the pretreatment methods in Task 2. The results show that highly dispersed catalysts can effectively be used to increase the yields of soluble material. An important aspect of highly dispersed catalysts are that they can effectively catalyze coal conversion even in poor liquefaction solvents, thus making them very attractive in processes such as coprocessing where inexpensive liquefaction media such as resids are used.

25527 (DOE/PC/88811–T17) **Fundamental reaction pathways during coprocessing.** Stock, L.M. (Chicago Univ., IL (United States). Dept. of Chemistry); Gatsis, J.G. Chicago Univ., IL (United States). Dept. of Chemistry; Universal Oil Products Co., Des Plaines, IL (United States). Dec 1992. 98p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88PC88811. Order Number DE93014507. Source: OSTI; NTIS; GPO Dep.

The objective of this research was to investigate the fundamental reaction pathways in coal petroleum residuum coprocessing. Once the reaction pathways are defined, further efforts can be directed at improving those aspects of the chemistry of coprocessing that are responsible for the desired results such as high oil yields, low dihydrogen consumption, and mild reaction conditions. We decided to carry out this investigation by looking at four basic aspects of coprocessing: (1) the effect of fossil fuel materials on promoting reactions essential to coprocessing such as hydrogen atom transfer, carbon-carbon bond scission, and hydrodemethylation; (2) the effect of varied mild conditions on the coprocessing reactions; (3) determination of dihydrogen uptake and utilization under severe conditions as a function of the coal or petroleum residuum employed; and (4) the effect of varied dihydrogen pressure, temperature, and residence time on the uptake and utilization of dihydrogen and on the distribution of the coprocessed products. Accomplishments are described.

25528 (DOE/PC/88933–T2) **Alkali/TX_2 catalysts for CO/H_2 conversion to C_1-C_4 alcohols: Final technical progress report, September 1, 1988–August 31, 1991.** Klier, K.; Herman, R.G.; Richards-Babb, M.; Bastian, R.; Kieke, M. Lehigh Univ., Bethlehem, PA (United States). Mar 1993. 357p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-88PC88933. Order Number DE93012403. Source: OSTI; NTIS; GPO Dep.

The objective of this research is to determine the patterns of variations of catalyst activity and selectivity for the synthesis of alcohols from H_2/CO synthesis gas. Since the source of carbon can be coal-derived synthesis gas, this research makes a contribution to the technology for high quality clean transportation fuels and for basic chemicals from coal. Catalysts prepared were principally based on MoS_2, RuS_2, TaS_2, and NbS_2. Catalytic testing of these materials was carried out both before and after surface doping with Cs. In alcohol synthesis activation of hydrogen by the catalyst surface is essential. Knowledge of transition metal disulfide surface properties is important before the mechanism of hydrogen dissociation can be addressed. The electronic structures of MoS_2, RuS_2, and NbS_2 were studied both theoretically and experimentally. Experimental valence bands were obtained by high resolution electron spectroscopy for chemical analysis (HR-ESCA, also referred to as x-ray photoelectron spectroscopy) and theoretical valence bands were calculated using solid state extended Hueckel theory. Comparison of two-dimensional (2-D) MoS_2 theoretical valence bands with the experimental HR-ESCA valence bands of polycrystalline MoS_2 led to parametrization of the S 3s, S 3p, and Mo 4d atomic ionization potentials and Slater-type coefficients and exponents. The S 3s and S 3p parameters obtained for MoS_2 were used to obtain the NbS_2 and RuS_2 theoretical valence bands.

25529 (DOE/PC/89767–T11) **Novel technique for coal pyrolysis and hydrogenation product analysis: Final technical report.** Pfefferle, L.D.; Boyle, J. Yale Univ., New Haven, CT (United States). Dept. of Chemical Engineering. 15 Mar 1993. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-89PC89767. Order Number DE93013074. Source: OSTI; NTIS; GPO Dep.

A microjet reactor coupled to a VUV photoionization time-of-flight mass spectrometer has been used to obtain species measurements during high temperature pyrolysis and oxidation of a wide range of hydrocarbon compounds ranging from allene and acetylene to cyclohexane, benzene and toluene. Initial work focused on calibration of the technique, optimization of ion collection and detection and characterization of limitations. Using the optimized technique with 118 nm photoionization, intermediate species profiles were obtained for analysis of the hydrocarbon pyrolysis and oxidation mechanisms. The "soft" ionization, yielding predominantly molecular ions, allowed the study of reaction pathways in these high temperature systems where both sampling and detection challenges are severe. Work has focused on the pyrolysis and oxidative pyrolysis of aliphatic and aromatic hydrocarbon mixtures representative of coal pyrolysis and hydropyrolysis products. The detailed mass spectra obtained during pyrolysis and oxidation of hydrocarbon mixtures is especially important because of the complex nature of the product mixture even at short residence times and low primary reactant conversions. The combustion community has advanced detailed modeling of pyrolysis and oxidation to the C4 hydrocarbon level but in general above that size uncertainties in rate constant and thermodynamic data do not allow us to a priori predict products from mixed hydrocarbon pyrolyses using a detailed chemistry model. For pyrolysis of mixtures of coal-derived liquid fractions with a large range of compound structures and molecular weights in the hundreds of amu the modeling challenge is severe. Lumped models are possible from stable product data.

25530 (DOE/PC/89865–T6) **Synthesis of dimethyl ether and alternative fuels in the liquid phase from coal-derived synthesis gas: Task 2.2: Definition of preferred catalyst system; Task 2.3: Process variable scans on the preferred catalyst system; Task 2.4: Life-test on the preferred catalyst system.** Bhatt, B.L. Air Products and Chemicals, Inc., Allentown, PA (United States). Sep 1992. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC89865. Order Number DE93011700. Source: OSTI; NTIS; GPO Dep.

As part of the DOE-sponsored contract for the Synthesis of Dimethyl Ether (DME) and Alternative Fuels in the Liquid Phase from Coal- Derived Syngas, the single-step, slurry phase DME synthesis process was developed. The development involved screening of catalyst systems, process variable studies, and catalyst life studies in two 300 ml stirred autoclaves. As a spin-off of the Liquid Phase Methanol (LPMEOH") process, the new process significantly improves the syngas conversion efficiency of the LPMEOH process. This improvement can be achieved by replacing a portion of methanol catalyst with a dehydration catalyst in the reactor, resulting in the product methanol being converted to DME, thus avoiding the thermodynamic equilibrium constraint of the methanol reaction. Overall, this increases syngas conversion per-pass. The selectivity and productivity of DME and methanol are affected by the catalyst system employed as well as operating conditions. A preferred catalyst system, consisting of a physical mixture of a methanol catalyst and a gamma alumina, was identified. An improvement of about 50% in methanol equivalent productivity was achieved compared to the LPMEOH process. Results from the process variable study indicate that higher pressure and CO_2 removal benefit the process significantly. Limited life studies performed on the preferred catalyst system suggest somewhat higher than expected deactivation rate for the methanol catalyst. Several DME/methanol mixtures were measured for their key properties as transportation fuels. With small amounts of DME added, significant improvements in both flash points and Reid Vapor Pressure (RVP) were observed over the corresponding values of methanol alone.

25531 (DOE/PC/89865–T7) **Synthesis of dimethyl ether and alternative fuels in the liquid phase from coal-derived synthesis gas: Task 3.2: Screen novel catalyst systems; Task 3.3:, Evaluation of the preferred catalyst system.** Underwood, R.P. Air Products and Chemicals, Inc., Allentown, PA (United States). Jan 1993. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC89865. Order Number DE93013075. Source: OSTI; NTIS; GPO Dep.

As part of the DOE-sponsored contract "Synthesis of Dimethyl Ether and Alternative Fuels in the Liquid Phase from Coal-Derived Syngas" experimental evaluations of the one-step synthesis of alternative fuels were carried out. The objective of this work was to develop novel processes for converting coal-derived syngas to fuels or fuel additives. Building on a technology base acquired during the development of the Liquid Phase Methanol (LPMEOH) process, this work focused on the development of slurry reactor based processes. The experimental investigations, which involved bench-scale reactor studies, focused primarily on three areas: (1) One-step, slurry-phase syngas conversion to hydrocarbons or methanol/hydrocarbon mixtures using a mixture of methanol synthesis catalyst and methanol conversion catalyst in the same slurry reactor. (2) Slurry-phase conversion of syngas to mixed alcohols using various catalysts. (3) One-step, slurry-phase syngas conversion to mixed ethers using a mixture of mixed alcohols synthesis catalyst and dehydration catalyst in the same slurry reactor. The experimental results indicate that, of the three types of processes investigated, slurry phase conversion of syngas to mixed alcohols shows the most promise for further process development. Evaluations of various mixed alcohols catalysts show that a cesium-promoted $Cu/ZnO/Al_2O_3$ methanol synthesis catalyst, developed in Air Products' laboratories, has the highest performance in terms of rate and selectivity for C_{2+}-alcohols. In fact, once-through conversion at industrially practical reaction conditions yielded a mixed alcohols product potentially suitable for direct gasoline blending. Moreover, an additional attractive aspect of this catalyst is its high selectivity for branched alcohols, potential precursors to iso-olefins for use in etherification.

25532 (DOE/PC/89876–T18) **Biological production of ethanol from coal: Final report.** Arkansas Univ., Fayetteville, AR (United States). Dept. of Chemical Engineering. Dec 1992. 298p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89876. Order Number DE93014938. Source: OSTI; NTIS; GPO Dep.

Due to the abundant supply of coal in the United States, significant research efforts have occurred over the past 15 years concerning the conversion of coal to liquid fuels. Researchers at the University of Arkansas have concentrated on a biological approach to coal liquefaction, starting with coal-derived synthesis gas as the raw material. Synthesis gas, a mixture of CO, H_2, CO_2, CH_4 and sulfur gases, is first produced using traditional gasification techniques. The CO, CO_2 and H_2 are then converted to ethanol using a bacterial culture of Clostridium 1jungdahlii. Ethanol is the desired product if the resultant product stream is to be used as a

liquid fuel. However, under normal operating conditions, the "wild strain" produces acetate in favor of ethanol in conjunction with growth in a 20:1 molar ratio. Research was performed to determine the conditions necessary to maximize not only the ratio of ethanol to acetate, but also to maximize the concentration of ethanol resulting in the product stream.

25533 (DOE/PC/90033–23) **Run 263 with Black Thunder Mine subbituminous coal and dispersed molybdenum catalysts: Technical progress report.** Southern Co. Services, Inc., Birmingham, AL (United States); Southern Electric International, Inc., Wilsonville, AL (United States). Dec 1992. 298p. Sponsored by USDOE, Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States). DOE Contract AC22-90PC90033. RP1234-1-2. Order Number DE93011539. Source: OSTI; NTIS; GPO Dep.

This report presents the results of Run 263 performed at the Advanced Coal Liquefaction R&D Facility in Wilsonville, Alabama. The run started on October 31, 1991 and continued until February 23, 1992. Tests were conducted by operating the reactors in the Close-Coupled Integrated Two-Stage Liquefaction mode and by processing Black Thunder Mine subbituminous coal from Wyodak-Anderson seam in Wyoming Powder River Basin. Half volume reactors were used for the entire run. In the first part of Run 263, a dispersed molybdenum catalyst was evaluated for its performance without a supported catalyst in the second stage. Molyvan L and Molyvan 822 (commercially available as friction reducing lubricants) were used as precursors for the dispersed molybdenum catalyst. The effect of the dispersed catalyst on eliminating the solids buildup was also evaluated. For the second part of the run, the hybrid catalyst system was tested with supported Criterion 324 1/1611 catalyst in the second stage at catalyst replacement rates of 2 and 3 lb/ton of MF coal. The molybdenum concentration was 100–200 ppm based on MF coal. Iron oxide was used as a slurry catalyst precursor at a rate of 1–2 wt % MF coal throughout the run with dimethyl disulfide (DMDS) as the sulfiding agent. The close-coupled reactor unit was on-stream for 2482 hours for an on-stream factor of 91.2% and the ROSE-SR^{sm} unit was on-feed for 2126 hours for an on-stream factor of 96.4% for the entire run.

25534 (DOE/PC/90307–7) **Reactivity of young chars via energetic distribution measurements: Quarterly technical progress report, 15 March 1992–30 June 1992.** Calo, J.M.; Zhang, L.H.; Lilly, W.D. Brown Univ., Providence, RI (United States). Div. of Engineering. [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90307. Order Number DE93017010. Source: OSTI; NTIS; GPO Dep.

The correlation and prediction of kinetic rates and mechanisms of the reactions of gas phase species with coal chars represent a difficult undertaking under the best of circumstances. Solid phase heterogeneity and impurities, complex pore structure, transport limitation, and evolution of active surface represent just a few of the well known problems. Temperature programmed desorption (TPD) has become a standard technique for investigating the physics-chemical state of adsorbed species on surfaces. The TPD spectra usually consist of one or more peaks. The shapes of the peaks and the position of the peak maxima with respect to temperature are related in a fundamental manner to the desorption process, and, therefore, provide basic information regarding the energetics of the desorbed species. The current project is directed at developing related techniques for the characterization and prediction/correlation of the reactivity of "young" chars to steam and oxygen. Of particular interest is mapping of the reactivity behavior of the resultant chars, as revealed by the energetic heterogeneity of the complexes with char preparation conditions; i.e., heating rate and ultimate temperature. Progress is described.

25535 (DOE/PC/90307–8) **Reactivity of young chars via energetic distribution measurements: Quarterly technical progress report, 1 July 1992–30 September 1992.** Calo, J.M.; Zhang, L.H.; Lilly, W.D. 25536 (DOE/PC/90312–T10) **Hot gas desulfurization with sorbents containing mixed metal oxides: Final report, October 1, 1990–December 31, 1992.** Akyurtlu, A.; Akyurtlu, J.F. Hampton Univ., VA (United States). Dept. of Engineering. [1992]. 114p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90312. Order Number DE93017044. Source: OSTI; NTIS; GPO Dep.

In this project the sulfidation and regeneration behavior of vanadium-promoted zinc ferrite sorbents was investigated by microreactor studies and physical characterization of the promoted sorbents. The discussion of results are presented for the fresh and used sorbent characterizations Zn-Fe-V-O, and standard sulfidation and regeneration experiments followed by the discussion of the effects of sulfidation temperature, calcination temperature, and the water vapor content of the simulated fuel gas.

25537 (DOE/PC/90537–T1) **Sequential low-temperature depolymerization and liquefaction of US coals: Progress report No. 1, October 1–December 31, 1986.** Shabtai, J.S.; Wiser, W.H. Utah Univ., Salt Lake City, UT (United States). Dept. of Fuels Engineering. Jan 1987. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-86PC90537. Order Number DE93015630. Source: OSTI; NTIS; GPO Dep.

Results obtained in the studies with BS(IL) coal as feed can be summarized as follows: (1) The low-temperature depolymerization - liquefaction procedure, summarized in Figure 1, is easily adaptable and applicable to a high-sulfur, Burning Star (Illinois No. 6) coal sample. The final product obtained consists of a fully desulfurized, light hydrocarbon oil. (2)Suitable processing conditions for each step of the stepwise depolymerization - liquefaction of the above coal were determined. (3)Direct hydroprocessing of the Burning Star (Illinois No. 6) coal with sulfided catalysts is ineffective for its conversion into a light hydrocarbon product. In accordance with the research program the depolymerized, THF-soluble coal products will be subjected to detailed analysis for the purpose of deriving average molecular structures for the oil, asphaltene and asphaltol fractions. The data obtained will be used to develop a structural model for the BS(IL) coal.

25538 (DOE/PC/91054–T6) **Effect of pretreating of host oil on coprocessing: Quarterly progress report, January 1, 1993–March 31, 1993.** Wender, I.; Tierney, J.W. Pittsburgh Univ., PA (United States). Dept. of Chemical and Petroleum Engineering. 11 May 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91054. Order Number DE93016858. Source: OSTI; NTIS; GPO Dep.

The principal objective of this research is to determine the role that host petroleum-derived oils (1000 °F$^+$), as that of catalytically treated host oils, play when used as liquefaction solvents in coprocessing with coal. The host oils will be extensively characterized and then pretreated in a number of ways which involve catalytic reactions such as hydrogenation, hydrocracking, and isomerization. The pretreated oils will then be characterized by elemental analysis, catalytic dehydrogenation, and NMR. The effects of the host oil on coprocessing with coal will be compared to those obtained using catalytically modified heavy oils. When appropriate, model compounds will be used to study specific reactions brought about by the pretreatments. A total of 18 pretreatment runs have been

made on an AMOCO vacuum tower residuum, VTR, in an attempt to increase its hydrogen content from 10.2 wt % to a level of about 11.5%. This pretreatment resulted in a significant increase in the hydrogen content of the starting oil (10.2 wt % to 11.2%).

25539 (DOE/PC/91257–T16) **Molten-Caustic-Leaching (Gravimelt) System Integration Project, Phase 2: Topical report for test circuit operation.** TRW Space and Technology Group, Redondo Beach, CA (United States). Applied Technology Div. Feb 1993. 140p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC91257. Order Number DE93013617. Source: OSTI; NTIS; GPO Dep.

The objective of the task (Task 6) covered in this document was to operate the refurbished/modified test circuit of the Gravimelt Process in a continuous integrated manner to obtain the engineering and operational data necessary to assess the technical performance and reliability of the circuit. This data is critical to the development of this technology as a feasible means of producing premium clean burning fuels that meet New Source Performance Standards (NSPS). Significant refurbishments and design modifications had been made to the facility (in particular to the vacuum filtration and evaporation units) during Tasks 1 and 2, followed by off-line testing (Task 3). Two weeks of continuous around-the-clock operation of the refurbished/modified MCL test circuit were performed. During the second week of testing, all sections of the plant were operated in an integrated fashion for an extended period of time, including a substantial number of hours of on-stream time for the vacuum filters and the caustic evaporation unit. A new process configuration was tested in which centrate from the acid wash train (without acid addition) was used as the water makeup for the water wash train, thus-eliminating the one remaining process waste water stream. A 9-inch centrifuge was tested at various solids loadings and at flow rates up to 400 lbs/hr of coal feed to obtain a twenty-fold scaleup factor over the MCL integrated test facility centrifuge performance data.

25540 (DOE/PC/91257–T17) **Molten-Caustic-Leaching (Gravimelt) System Integration Project, Phase 2: Topical report for test circuit maintenance, refurbishment, modification, and off-line operation.** TRW Space and Technology Group, Redondo Beach, CA (United States). Applied Technology Div. Mar 1993. 162p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC91257. Order Number DE93013616. Source: OSTI; NTIS; GPO Dep.

This is a report of the maintenance, refurbishment, modifications, and off-line circuit component testing of the integrated test circuit of the Molten-Caustic-Leaching (MCL or Gravimelt) process for the desulfurization and demineralization of coal. The project is sponsored by the Pittsburgh Energy Technology Center of the US Department of Energy under Contract No. DE-AC22-86-PC91257.

25541 (LBL–33769) **Fundamental studies of the mechanism of catalytic reactions with catalysts effective in the gasification of carbon solids and the oxidative coupling of methane: Quarterly report, January 1, 1993–March 31, 1993.** Heinemann, H.; Somorjai, G.A.; Perry, D.L. Lawrence Berkeley Lab., CA (United States). Mar 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015265. Source: OSTI; NTIS; GPO Dep.

Work continued on the development of catalysts for the steam gasification of chars and for the oxidative coupling of methane. Testing of the catalysts Ni-Ca-K-oxides and Co-Ca-K-oxides are described for gasification research; results of the testing of a Co-Mg-oxide catalysts for methane conversion are also described.

25542 (NUTEK-FGT–93-1) **Gasification LTH, Stage 8. Final report.** Andersson, Lars (Lund Inst. of Tech. (Sweden). Dept of Chemical Technology); Bjerle, I.; Hellgren, R.; Johansson, Anders; Karlegaerd, Aa.; Lindblom, M. Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). 1993. 206 p.p. (In Swedish). Project NUTEK-136-026. Order Number DE93500741. Source: OSTI; NTIS.

This final report is divided into 8 independent sections, and 6 of them have their own table of contents. The content of the different sections are: Determination of calorific value for gas, using catalytic combustion and lambda sond; Ammonia removal from gasification gas. A literature survey; Introductory desulfurization experiments with zinc-ferrite. Experimental results; Hot gas desulfurization with zinc-ferrite. Experimental results; Characterization of liquid and chars produced through high temperature pyrolysis of wood; 13C-NMR characterization of tar liquids and wood chars; Implementation of decomposition kinetics in wood in simulation of a drop-tube furnace; Literature survey Gasification of Biomass - Commentary and reference.

25543 (NUTEK-FGT–93-2) **Partial gasification PFBC, Stage 2. Final report.** Sjoestroem, K. (Royal Inst. of Tech., Stockholm (Sweden). Dept. of Chemical Technology). Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden); Royal Inst. of Tech., Stockholm (Sweden). Dept. of Chemical Technology. 1993. 30p. (In Swedish). Project NUTEK-276-367. (TRITA-KT–92-3). Order Number DE93500745. Source: OSTI; NTIS.

ABB has developed a pressurized fluidized bed combustion process (PFBC). This project is a part of the continued development for enhanced process efficiency and improved environmental performance of this process. The process efficiency can be enhanced by increasing the gas turbine inlet temperature. The temperature in the combustion chamber cannot be increased due to the resulting prohibitively high alkali concentrations. This problem can be by-passed through of a topping gas to the combustion chamber exhausts and eventual combustion in an afterburner. The topping gas will be from partial gasification of the coal in a separate pyrolysis reactor. In the described process concept sulfur will be absorbed on dolomite in the combustion bed. Sulfur emissions will then mainly be the result of organic sulfur in the tar fraction of the pyrolysis gas. As sulfur only can be absorbed on dolomite as hydrogen sulfide the organic sulfur compounds must be decomposed into hydrogen sulfide and hydrocarbons. It is known that half calcined dolomite ($CaCO_3$ MgO) has the best sulfur capturing capacity. The dolomite also has tar cracking capacity which is of importance in the cracking of the organic sulfur compounds such as thiophene.

25544 (Riso-R–669(EN)) **Using the distributed activation energy model to interpret oxidative coal pyrolysis experiments performed by flat-flame burner, entrained-flow reactor and thermogravimetric analyzer.** Holst Soerensen, L. (Risoe National Laboratory, Department of Combustion Research, Roskilde (Denmark)); Biede, O.; Peck, R.E. Risoe National Lab., Roskilde (Denmark). Combustion Dept. May 1993. 71 p.p. Contract EM-1323/88-23. Order Number DE93500191. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

EFP-88.

Coal pyrolysis experiments with a Flat Flame Burner an Entrained Flow Reactor and a Thermogravimetric Analyzer has been done on a Pittsburg 8 coal-type. The instruments offer extremely different conditions with respect to environment for- and heating rate of the particles examined. Each individual instrument provide characteristic results. The results obtained from each of the instruments are combined to provide a better background for modelling the pyrolysis of the coals under varying conditions. A procedure for using the Distributed Activation Energy (DAE) model to describe coal devolatilization in a flame is proposed. It is described how to calibrate and test the DAE model from experiments performed with a Flat-Flame Burner and an Entrained-Flow Reactor. The model enabled realistic predictions of devolatilization characteristics for a Pittsburg 8 coal dust for a range of heating/oxidizing environments. The results indicate that for rapid heating (10^5K/s) release of primary volatiles occurred within 3-10 ms and before calculated particle peak temperatures of 1200-1500K were reached. The calibrated DAE-model approach combined with a model describing the heat balance for a coal particle in a hot environment, allows comparison of coal particle conversion rates due to kinetic reaction rates and mass- and heat transfer effects. Reported kinetic parameters derived under inert slow heating rate conditions by thermogravimetry (TGA) were shown to be applicable under high heating rate conditions. However with the calibrated data applicable for the Flat Flame Burner experiments lower temperature yields obtained by an Entrained Flow Reactor were underestimated. This showed that the simple DAE-model is not able to cover a large temperature regime

when high heating rates are applied. A comparison between the TGA proximate volatiles of the coal and the chars processed in the Flat-Flame Burner is performed. (Abstract Truncated)

25545 (CONF-880912–35) **Coal structure and behavior: Interfacial chemistry in coal.** Ross, D.S.; Hirschon, A.S.; Green, T.K. SRI International, Menlo Park, CA (United States). [1988]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79936. From 196. American Chemical Society (ACS) national meeting; Los Angeles, CA (United States); 25-30 Sep 1988. Order Number DE93012935. Source: OSTI; NTIS; GPO Dep.

In an attempt to evaluate the importance of interfacial chemistry to coal behavior, we have conducted studies at 400°C with both H_2O and D_2O, using both Illinois No. 6 coal (PSOC 1098) and pure organic compounds. Figure 3 summarizes our effort, and virtually none of the material presented here is consistent with the organic structures depicted in Figure 1. We found that while coal recovered from simple hydrothermal treatment in D_2O/N_2 for 20 minutes under nitrogen contained more than 90% of the starting carbon, 36% of the starting hydrogen and about half the starting oxygen were lost. Our account of the anomalous O-loss has recently appeared (2). These loses could not be accounted for by CO_x and light hydrocarbon evolution. Of the remaining protium in the product, 53% had been exchanged for deuterium. The product had been subjected to back-exchange in H_2O at mild conditions to convert the phenolic hydrogen to protium, so the large levels of exchange were strictly for hydrogen bonded to carbon. These findings can be compared with those from work with work under the same conditions with pure organic materials. At 20 minutes in D_2O we found no trace of exchange for benzene, toluene, or bibenzyl. Thus, the benzyl-protium exchange rate in coal is roughly 100 times faster than that for bibenzyl and considerably faster than that for toluene. This result can be translated to suggest that the thermal generation of free radical sites in the coal operates at a rate two to three orders of magnitude greater than that for bibenzyl. However no feature in the organic structures proposed for coal can generate such a flux of reactive free radicals by a wide margin.

25546 (DOE/PC/91283–T7) **Liquid chromatographic analysis of coal surface properties: Quarterly progress report, January–March 1993.** Kwon, K.C.; Rigby, R. Tuskegee Univ., AL (United States). Research continued on coal surface properties. Experiments on equilibrium adsorption loadings of various probe compounds on 60–200 mesh Illinois #6 coal (PSOC-1539), Adaville #1 coal (PSOC-1544), Wyodak coal (PSOC-1545) and Pittsburgh#8 coal (PSOC-1549) were performed during the January–March period. The probe compounds include m-cresol, p-cresol, n-octanol, n-heptanol, n-butanol, phenol and toluene.

EFP-87.

The aim was to investigate the combustion reactivity of coal chars in pulverized coal-fired power plant boilers as it is measured by different laboratory scale methods, and possible correlations between results obtained using these methods. The overall aim was, through the correlation of advanced and more simplistic analytical methods, to find methods that could improve the prediction of coal char reactivity. Ten types of coal were selected for detailed petrographical and chemical analysis. These were Cerreion, Blair Atholl, Ulan, Blue 1, Dietz, Illinois 6, Colorado Bas. B., Hiawatha and Lower Kittaning. A thorough characterization of the raw coals using routine chemical and petrographical methods supplemented with a few more advanced techniques was carried out. Results showed marked differences in the content and composition of the ash, the petrographic composition and the rank conditions. Combustion problems have been attributed to the content, distribution and composition of the mineral matter in the coal. The results and conclusions of these investigations are presented in great detail. (AB) (57 refs.).

25549 (NUTEK-TORV–93-1) **Characterization of peat. Project report.** Bergner, K. (National lab. of agricultural sciences, Umeaa (Sweden) and Swedish Univ. of Agricultural Sciences, Umeaa (Sweden)). Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). 1993. 32p. (In Swedish). Project NUTEK-216-088. Order Number DE93500749. Source: OSTI; NTIS.

This report is a summary of the fourth period (1990-1992) of a research project about fundamental studies of peat characterization. In order to obtain a broad and fundamental understanding of peat and peat-water relationships, the project covers several different scientific areas. Each area has in turn comprised several subprojects. During the first period, the major efforts were to establish good characterization methods (biological, chemical) and to establish a good working knowledge about established methods for peat dewatering. In the second and third period this work was extended into more detailed studies of specific problems. The project represents the restart of basic peat research in Sweden, and much of the work so far has served to reestablish fundamental peat knowhow. In doing so, traditional methods have been reviewed, but in addition some very recent methodological developments have been adopted. The experience gained while studying peat with these methods will also be useful in a wider context. The basic idea of the project has been to obtain a fairly 'complete' description of peat. The project has an integrated approach which means that several subprojects are done with participation from different parts of the project.

This paper presents an historical account of the use of fly ash in UK concrete construction. Research findings are charted from the

first studies on the compressive strengths to the more recent concerns of long-term durability in aggressive environments and the ability of fly ash to suppress damage alkali-aggregate reaction. Major achievements in the field of concrete construction from the early use of non-classified ash to reduce temperature rises and cement costs in large dams to the specification of high-performance fly ash concrete to meet the rigorous demands of 120-year design life in marine environments. The development of British Standards for the specification of fly. ash for use in concrete are also discussed. It is concluded that the abundant evidence from the laboratory and field together with the existence of a onerous specification to control variability should provide engineers with the confidence to use fly ash to generally improve the quality of concrete construction.

Developing a technology at even higher level for burning coal with establishing its exhaust gas reduction measures becoming increasingly more important requires discussions on coals at molecular levels based on coal chemistry. From this viewpoint, this paper introduces latest researches on desulfurization with a fluidized bed furnace utilizing calcium loaded brown coal, and on an approach to NOx generation from coal structures (elucidating temperature dependence of NOx discharge through measuring bonding patterns of nitrogen in coals). Specifically speaking on the former research for example, it attempts improving the fluidized bed combustion that is low in the utilization rate of desulfurizing agent in furnace (limestone) requiring a large amount of limestone in spite of many features of the process, by means of burning a mixture of coal with brown coal loaded with calcium through ion exchange process to remove SO2. A precision experiment using a thermo-balance and a continuous combustion experiment using a small circulation fluidized bed showed a remarkable effect of calcium loaded coal. It was indicated that this is because of CaO particles in ash from the calcium loaded coal being very small in size. 5 refs., 9 figs., 3 tabs.

Source: OSTI; NTIS (US Sales Only).

This paper introduces the actual situation of environmental contamination observed during a visit to the city of Chungching, China, and presents a view and a proposal to solving environmental problems in developing countries. The maximum concentration of SO2 in Chungching City has reached as high as 2 mg/Nm^3, so has smoke and soot concentration similarly high, and impediments to human health have emerged clearly. Small factories and households cannot be ignored as generation sources. Several thousand units of air bubble type fluidized bed have been installed as a measure to reduce generation of contaminants, but nearly all has ended in failure. The reason for this is reportedly because of use of insufficiently cleaned coal and severe wear of heat exchangers. Four pieces of gypsum-based desulfurizer have been installed, but the gypsum utility has been low and none of the equipment is in operation now. The key to developing the Chinese economy is to improve agricultural productivity, where development of such technologies are wanted as a simplified desulfurization process that can produce ammonium sulfate fertilizer as a by-product, a desulfurization technology that can improve heat efficiency in stoker firing systems that account for the majority of the currently used systems, and pre-desulfurization and gasification technologies that suit Chinese coals. 1 ref., 2 figs., 2 tabs.

A stack gas desulfurization process in an oil and coal burning device removes SO2 from exhaust gases through absorption, but performs concomitantly secondary removal of solids in the gases, a dedusting function. This paper explains theoretical and design gists for the process noticing the above functions. Most frequently used gas-liquid contact mechanisms in wet type stack gas desulfurization equipment include a spray system, a filling column system, and a jet bubbling reactor (JBR) system. The JBR resembles the bubble cap tray, and has a function to collect solid particles accompanying bubble generation. Its collection efficiency has been published in the form of a theoretical equation for fully hydrophilic particles, which provides information on its relation with particle sizes and with equipment characteristics. However, this theory requires an attention that the equation hypothesizes that liquid containing particles can be separated completely from the gases, and the particles are fully hydrophilic. There are such other parts than the JBR as a prescrubber and a gas burning gas heater which can be expected of dedusting function. 4 refs., 7 figs.

25554 (OCDO–93013791) **Ammonia regeneration for a combined lime/ammonia spray dryer for SO_2 control: Final report.** Xinjian, Yang (Cincinnati Univ., OH (United States). Dept. of Civil and Environmental Engineering). Ohio Coal Development Office, Columbus, OH (United States); Cincinnati Univ., OH (United States). Dept. of Civil and Environmental Engineering. 23 Dec 1992. 170p. Sponsored by Ohio State Government, Columbus, OH (United States). Source: OSTI; Ohio Coal Development Office, 77 S. High Street, P.O. Box 1001, Columbus, OH 43266-0001.

A research project designed to study the feasibility of ammonia regeneration for a combined lime/ammonia FGD process was conducted at the University of Cincinnati. The major objective for this project was to regenerate ammonia from a combined ammonia/calcium hydroxide spray dryer FGD byproduct for reuse which would reduce the operating cost of this FGD process. This final report covers the six phases of the project: (1) generation of original feedstock, (2) batch regeneration studies, (3) continuous regeneration studies, (4) waste characteristic analysis, (5) pilot scale demonstration and (6) economic analysis. This research has shown that regeneration of ammonia is feasible at a reasonable cost. The effects on Ohio coal use from the results of this research could be substantial, depending on the Phase II application of FGD systems for controlling SO_2 emissions. In conclusion, experiments in this study have shown that ammonia recovery efficiencies greater than 90% are technically and economically feasible. In addition, the sludge produced from the regeneration process is stable and will meet existing Federal standards.

25555 (OCDO–93013794) **Design and development of a novel gas desulfurization process using hollow fiber membranes to stimulate the utilization of high sulfur Ohio coal: Final report.** LeBlanc, S.E.; Varanasi, S. Ohio Coal Development Office, Columbus, OH (United States); Toledo Univ., OH (United States). Dept. of Chemical Engineering. Jan 1990. 106p. Sponsored by Ohio State Government, Columbus, OH (United States). Source: OSTI; Ohio Coal Development Office, 77 S. High Street, P.O. Box 1001, Columbus, OH 43266-0001 (United States).

The objective of this proposed research was to carry out a detailed theoretical and experimental study of SO_2 absorption in bench-scale hollow fiber absorbers (HFAs) under conditions representative of industrial flue gas desulfurization, and to use this knowledge to develop design criteria necessary for replacing conventional packed towers with industrial scale HFAS. If the use of high sulfur coal is ever to come to fruition, we must strive to explore new technologies which surpass the performance of existing systems. The precise objectives of this research were as follows: Construct a benchscale HFA module apparatus for experimental testing. Investigate the effect of important process parameters on HFA module performance (i.e. its ability to remove SO_2). Obtain correlations for predicting the mass transfer coefficient (a direct reflection of module performance) for SO_2 removal based on the experimental results develop a mathematical model, design criteria,

and operating condition guidelines to produce optimum HFA module performance in desulfurization applications.

The United States produced just over 1 billion short tons of coal in 1992, 0.4 percent more than in 1991. Most of the 4-million-short-ton increase in coal production occurred west of the Mississippi River, where a record level of 408 million short tons of coal was produced. The amount of coal received by domestic consumers in 1992 totaled 887 miliion short tons. This was 7 million short tons more than in 1991, primarily due to increased coal demand from electric utilities. The average price of delivered coal to each sector declined by about 2 percent. Coal consumption in 1992 was 893 million short tons, only 1 percent higher than in 1991, due primarily to a 1-percent increase in consumption at electric utility plants. Consumer coal stocks at the end of 1992 were 163 million short tons, a decrease of 3 percent from the level at the end of 1991, and the lowest year-end level since 1989. US coal exports fell 6 percent from the 1991 level to 103 million short tons in 1992. Less coal was exported to markets in Europe, Asia, and South America, but coal exports to Canada increased 4 million short tons.

25557 (VF-UV–92-36) **Treatment of peat bogs harvested by deep digging technique: A literature study.** Hoernsten, L. (Swedish Univ. of Agricultural Sciences, Umeaa (Sweden). Dept. of Forest Ecology). Vattenfall AB, Vaellingby (Sweden). Jun 1992. 65 p.p. (In Swedish). Order Number DE93500669. Source: OSTI; NTIS; INIS.

Examination paper.

The aim of this study is to describe how peat bogs harvested by deep digging technique can be treated after harvesting has come to an end. The study points out treatment methods, how the treatments are carried out and to indicate the most appropriate method of harvest for optimum results. Costs and benefits are calculated for the methods involving cultivation. The knowledge gained from traditional peat harvesting technique indicate forestry, energy wood production and establishment of ponds as possible alternatives. Energy grass cultivation and establishments of game parks have not been tested. but are assumed to be viable on suitable sites. Establishment of duck ponds are also possible, even though conditions for these are better on firm ground. In this study spruce is estimated to produce 200 cubic meters during 105 year whilst pine produces 300 cubic meters. Calculations for pine and spruce estimate costs of respectively 17000 and 18000 SEK per hectare after 105 years. Energy wood production is estimated to be 11.6 tons dry matter per hectare and year which gives a net cost of 19000 SEK per hectare. Similarly energy grass cultivation results in an average annual harvest of 6.5 ton dry matter and a cost of 59000 SEK per hectare. If the results are applied to three specific cases, then forest cultivation and establishment of ponds are possible in all cases. Neither energy wood nor energy grass are appropriate in any of the three regions. At the particular site for this study all methods mentioned are possible. Depending on whether draining leads to a high or low water table, the most appropriate course would be the establishment of a pond respectively a game park of forest cultivation. (59 refs., 12 tabs., 4 figs.).

One of the collaborative-coal projects that is being conducted under the US Korea Memorandum of Understanding (MOU) is entitled "Pilot-Scale Coal Combustion Test Facility. The objective of this PETC/KIER project is the design and construction of a state-of-the-art pilot-scale pulverized-coal combustion facility at KIER's research center in Taejon, Korea, and the subsequent conduct of a collaborative pulverized-coal combustion research program. The design of the KIER facility is based largely on the existing PETC Fuels Evaluation Facility (FEF). 2. KIER's management required additional PETC support in the form of a critical-design review of the combustion facility. Subsequently, KIER extended an invitation to scott Smouse, the Project Leader for the FEF, to visit KIER during the late summer of 1992. Given their immediate needs, KIER also offered to bear all costs incurred during the trip. 3. Scott Smouse completed the critical-design review of KIER's new combustion facility and provided his comments to KIER's staff before his departure. Upon his return to PETC, he prepared a formal report, which was subsequently forwarded to KIER.

25560 (DOE/MC/26302–3269) **Stability of flows in fluidized beds: Final report.** Viscoustech, Allison Park, PA (United States). Apr 1993. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-89MC26302. Order Number DE93000245. Source: OSTI; NTIS; GPO Dep.

We study the linearized stability of the state of uniform fluidization, within the context of the theory of mixtures. The mixture is assumed to be made up of a classical linearly viscous fluid mixed with solid particles. In marked departure from most of the previous studies, we model the solid as a granular material and assume a constitutive relation that stems from classical motions in continuum mechanics. The linearized stability analysis of the state of uniform fluidization, in general, leads to an eighth order equation for the characteristic whose root implies instability, when positive. We find that the characteristic equation can be factored and one of the factors is precisely the equation that governs the stability when we use a simplified analysis akin to that of the earlier study of Anderson and Jackson.

25561 (DOE/PC/79799–T17) **The Coal Tech Advanced Cyclone Combustor Demonstration Project: A DOE assessment.** USDOE Pittsburgh Energy Technology Center, PA (United States). May 1993. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-87PC79799. Order Number DE93017043. Source: OSTI; NTIS; GPO Dep.

The objective of this project was to demonstrate a technology for retrofitting oil/gas designed boilers, and conventional pulverized

coal-fired boilers, by using the patented air-cooled slagging coal combustor in place of oil/gas/coal burners. The project aimed to utilize coals with a wide range of sulfur contents and to achieve efficient combustion under fuel-rich conditions. The three performance goals of the combustor were to limit emissions of SO_2 and NO_x, while maintaining maximum sulfur retention in the slag removed from the combustor. A slagging cyclone combustor is a high-temperature device in which a high-velocity swirling gas is used to burn crushed or pulverized coal. The key novel feature of this combustor is the use of air cooling. This is accomplished by using a ceramic liner which is cooled by secondary air and maintained at a temperature high enough to keep the slag in a liquid, free-flowing state. The arrangement also promotes slag retention in the combustor, an important feature for retrofitting in boilers designed for oil/gas.

To conduct studies on the combustion of coal water fuels (CWFs) an appropriate facility was designed and constructed. The main components were (1) a high-temperature isothermal laminar flow furnace that facilitates observation of combustion events in its interior. The design of this system and its characterization are described in Chapter 1. (2) Apparatus for slurry droplet/agglomerate particle generation and introduction in the furnace. These devices are described in Chapters 1 and 3 and other attached publications. (3) An electronic optical pyrometer whose design, construction theory of operation, calibration and performance are presented in Chapter 2. (4) A multitude of other accessories, such as particle fluidization devices, a suction thermometer, a velocimeter, high speed photographic equipment, calibration devices for the pyrometer, etc., are described throughout this report. Results on the combustion of CWF droplets and CWF agglomerates made from micronized coal are described in Chapter 3. In the same chapter the combustion of CWF containing dissolved calcium magnesium acetate (CMA) axe described. The combustion behavior of predried CWF agglomerates of pulverized grain coal is contrasted to that of agglomerates of micronized coal in Chapter 4. In the same chapter the combustion of agglomerates of carbon black and diesel soot is discussed as well. The effect of CMA on the combustion of the above materials is also discussed. Finally, the sulfur capture capability of CMA impregnated micronized and pulverized bituminous coals is examined in Chapter 5.

25563 (DOE/PC/90258–T3) **Characterization and supply of coal based fuels: Quarterly report, May 1, 1987–July 31, 1987.** Energy International, Inc., Pittsburgh, PA (United States). Sep 1987. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90258. Order Number DE93016787. Source: OSTI; NTIS; GPO Dep.

Contract objectives are as follows: Develop fuel specifications to serve combustor requirements. Select coals having appropriate compositional and quality characteristics as well as an economically attractive reserve base. Provide quality assurance for both the parent coals and the fuel forms. Deliver premium coal-based fuels to combustor developers as needed for their contract work. During the third quarter of this contract (May 1 through July 31, 1987) the primary activities were involved with: Completion and submission for approval by the DOE of the topical report describing the market survey, the coal selection and the fuel specification methodologies used in carrying out Task 1. The determination of the washability of the first five coals selected in Task 1. Upgrading and improvement of the pilot wash circuit to improve both the product quality and yield. Initiation of a data base survey to select an appropriate coal for the Vortec contract; and continuation of the coal procurement, cleaning, fuel preparation and delivery activities.

Contract objectives are as follows: Develop fuel specifications to serve combustor requirements; Select coals having appropriate compositional and quality characteristics as well as an economically attractive reserve base; Provide quality assurance for both the parent coals and the fuel forms; and deliver premium coal-based fuels to combustor developers as needed for their contract work. This quarter, work continued on washability studies, deashing and coal delivery requirements.

25568 (DOE/PC/90258–T9) **Characterization and supply of coal-based fuels: Quarterly report, November 1, 1988–January 31, 1989.** Energy International, Inc., Pittsburgh, PA (United States). Mar 1989. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90258. Order Number DE93016781. Source: OSTI; NTIS; GPO Dep.

The inorganic constituents or ash contained in pulverized coal significantly increase the environmental and economic costs of coal utilization. For example, ash particles produced during combustion may deposit on heat transfer surfaces, decreasing heat transfer rates and increasing maintenance costs. The minimization of particulate emissions often requires the installation of cleanup devices such as electrostatic precipitators, also adding to the expense of coal utilization. Despite these costly problems, a comprehensive assessment of the ash formation and had never been attempted. At the start of this program, it was hypothesized that ash deposition and ash particle emissions both depended upon the size and chemical composition of individual ash particles. Questions such as: What determines the size of individual ash particles? What determines their composition? Whether or not particles deposit? How combustion conditions, including reactor size, affect these processes? remained to be answered. In this 6-year multidisciplinary study, these issues were addressed in detail. The ambitious overall goal was the development of a comprehensive model to predict the size and chemical composition distributions of ash produced during pulverized coal combustion. Results are described.

25572 (DOE/PC/90751–T15-VOL.2) **Transformations of inorganic coal constituents in combustion systems: Volume 2, Sections 6 and 7: Final report.** Helble, J.J. (ed.) Results from an experimental investigation of the mechanisms governing the ash aerosol size segregated composition resulting from the combustion of pulverized coal in a laboratory scale downflow combustor are described. The results of modeling activities used to interpret the results of the experiments conducted under his subtask are also described in this section. Although results from the entire program are included, Phase II studies which emphasized: (1) alkali behavior, including a study of the interrelationship between potassium vaporization and sodium vaporization; and (2) iron behavior, including an examination of the extent of iron-aluminosilicate interactions, are highlighted. Idealized combustion determination of ash particle formation and surface stickiness are also described.

This report contains the computer codes developed for the coal combustion project. In Subsection B.1 the FORTRAN code developed for the percolative fragmentation model (or the discrete model, since a char is expressed as a collection of discrete elements in a discrete space) is presented. In Subsection B.2 the code for the continuum model (thus named because mineral inclusions are distributed in a continuum space) is presented. A stereological model code developed to obtain the pore size distribution from a two-dimensional data is presented in Subsection B.3.

25574 (DOE/PC/92152–T3) **The physics of coal liquid slurry atomization: Fourth Quarterly technical report, October 1, 1992–December 30, 1992.** Chigier, N.; Mansour, A. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Dept. of Mechanical Engineering. [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92152. Order Number DE93014949. Source: OSTI; NTIS; GPO Dep.

An experimental study has been conducted on a two dimensional twin fluid atomizer in which a liquid sheet is "sandwiched" between two sheets of high speed air. High speed photography and imaging were used to study the air-liquid interface region. Average intact lengths of liquid sheets were measured. The intact lengths were studied over a liquid Reynolds number range of 4000 and a Weber number of 30. The intact lengths were found to be strongly dependent on the Reynolds and Weber numbers. An empirical equation was derived as a function of these parameters.

25575 (ETDE/JP-mf–93798681, pp. 14-23) **Control of NOx and SOx generation in fluidized bed coal combustion, and N2O generation and its control.** Kimura, N. (Electric Power Development Co. Ltd., Tokyo (Japan)). 20 Jan 1993. 94p. (In Japanese). In *Symposium on global environmental conservation and air pollution prevention technology.* Order Number DE93798681. Source: OSTI; NTIS (US Sales Only).

With a purpose of establishing a technology for fluidized bed coal combustion, operation of a demonstration plant, a 50-MW fluidized bed boiler at the Wakamatsu thermal power plant has been continued since 1986. This paper reports the result of demonstration tests using nine kinds of overseas coals as to the NOx, SOx and N2O generation behaviors of the coals as well as the measures to reduce the generation. The test result showed the boiler's main combustion furnace having a combustion efficiency of 85% or higher, especially with high-volatility coals, a 99% or higher efficiency being very little affected from bed temperatures and air ratios in the bed. NOx generation increased with increasing combustion temperature, and the degree of temperature dependence varied largely by coal types. While SOx generation can be controlled by the amount of charged limestone, too low air ratio is not recommended. An optimum temperature exists. Such data on N2O being a global warming gas were obtained as influence of bed temperatures, use of higher exhaust gas temperatures as an exhaust gas generation preventive technology, free electron impinging treatment, and use of new catalysts. 14 figs., 3 tabs.

25576 (ETDE/JP-mf–93798681, pp. 30-34) **Semi-dry type dimplified desulfurizer.** Uemura, F. (Kawasaki Heavy Industries, Ltd., Tokyo (Japan)). 20 Jan 1993. 94p. (In Japanese). In *Symposium on global environmental conservation and air pollution prevention technology.* Order Number DE93798681. Source: OSTI; NTIS (US Sales Only).

Various types of stack gas desulfurization systems are available to remove sulfur from combustion gases generated in coal burning

boilers. This paper explains a semi-dry type desulfurizer suitable for developing countries because of its low construction and operating costs, easy operation and simple maintenance requirements. As an installation example, the paper shows using a system chart the configuration of a semi-dry type desulfurizer (for coal burning stoker boiler power generation consuming 32-T/H of coal and outputting 6-MW power) being installed under a Japanese Government's project of promoting research cooperation for Indonesia. The semi-dry type desulfurization process is a system to absorb SO2 in exhaust gases utilizing gas-liquid contact, which completes a desulfurization process at temperatures below the saturation temperature, and discharges no waste water outside the system. Major basic processes include an in-furnace desulfurization + water spray system, a dust injection system, and a spray dryer system. The in-furnace desulfurization system is of a two-step system consisting of a primary desulfurization to blow limestone powder into a boiler to remove sulfur and a process to spray water into exhaust gases downstream the boiler to cool the gases and remove sulfur. 5 figs., 1 tab.

25577 (ETSU-B–1313-P3) **An emissions audit of a chain grate stoker burning coal.** Jackson, P.M.; King, P.G. Warren Spring Lab., Stevenage (United Kingdom). 1993. 101p. (WSL-CR–3529(MR)). Order Number DE93504811. Source: OSTI; NTIS (US Sales Only); INIS.

This report describes the Emissions Audit carried out on a chain-grate stoker boiler burning coal. The boiler rated at 4.6MW(th) was installed at the Senior Foster Wheeler test facility in Wakefield where it had been modified so that it could burn both coal and dRDF. This report is based on test work undertaken as part of a programme to assess the environmental impact of the combustion of a variety of wastes as fuels. Emissions monitoring tests were carried out using coal as the fuel for comparison with the other wastes. Combustion of coal in boilers of this size are regulated by the Clean Air Acts whilst combustion of wastes is regulated by the more recent Environmental Protection Act. (author)

25578 (NEI-DK–1183) **The Technical University of Denmark/DIA cogeneration plant. Network measurements of temperature and gas concentrations in the combustion chamber: Measurements carried out in April - May 1991.** Johansen, L.P. Dk-TEKNIK, Soeborg (Denmark). Energi og Miljoe. Nov 1991. 44p. (In Danish). Contract EM-1323/86-2. Order Number DE93500125. Source: OSTI; NTIS.

EFP-86.

Temperature and gas concentration were measured in the combustion chamber of the coal-dust fired boiler at the cogeneration plant at the Technical University of Denmark. The aim was to determine the concentration of oxygen, carbon monoxide, sulfur dioxide, carbon dioxide and nitrogen monoxide after the coal-dust burner had been modified, as a basis for an evaluation of the influence of this modification on nitrogen monoxide emission. All the measurement results, some of which are shown three-dimensionally as curves running vertically through the boiler, are presented in detail. (AB).

25580 (DOE/BC/14425–T11) **Geologic setting, petrophysical characteristics, and regional heterogeneity patterns of the Smackover in southwest Alabama: Draft topical report on Subtasks 2 and 3.** Kopaska-Merkel, D.C.; Mann, S.D.; Tew, B.H. Alabama Geological Survey, Tuscaloosa, AL (United States). Jun 1992. 213p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-89BC14425. Order Number DE93014664. Source: OSTI; NTIS; GPO Dep.

This is the draft topical report on Subtasks 2 and 3 of DOE contract number DE-FG22-89BC14425, entitled "Establishment of an oil and gas database for increased recovery and characterization of oil and gas carbonate reservoir heterogeneity." This volume constitutes the final report on Subtask 3, which had as its primary goal the geological modeling of reservoir heterogeneity in Smackover reservoirs of southwest Alabama. This goal was interpreted to include a thorough analysis of Smackover reservoirs, which was required for an understanding of Smackover reservoir heterogeneity. This report is divided into six sections (including this brief introduction). Section two, entitled "Geologic setting," presents a concise summary of Jurassic paleogeography, structural setting, and stratigraphy in southwest Alabama. This section also includes a brief review of sedimentologic characteristics and stratigraphic framework of the Smackover, and a summary of the diagenetic processes that strongly affected Smackover reservoirs in Alabama. Section three, entitled "Analytical methods," summarizes all non-routine aspects of the analytical procedures used in this project. The major topics are thin-section description, analysis of commercial porosity and permeability data, capillary-pressure analysis, and field characterization. "Smackover reservoir characteristics" are described in section four, which begins with a general summary of the petrographic characteristics of porous and permeable Smackover strata. This is followed by a more-detailed petrophysical description of Smackover reservoirs.

25581 (DOE/BC/14425–T13-App.1-Vol.3) **Establishment of an oil and gas database for increased recovery and characterization of oil and gas carbonate reservoir heterogeneity: Appendix 1, Volume 3.** Kopaska-Merkel, D.C.; Moore, H.E. Jr.; Mann, S.D.; Hall, D.R. Alabama Geological Survey, Tuscaloosa, AL (United States). Jun 1992. 204p. Sponsored by USDOE, Washington, DC (United States). This volume contains maps, well logging, structural cross section, graph of production history, porosity vs. natural log permeability plots, detailed core log, paragenetic sequence, and reservoir characterization sheet for the following fields in southwest Alabama: North Smiths Church oil field; North Wallers Creek oil field; Northeast Barnett oil field; Northwest Range oil field; Pace Creek oil field; Palmers Crossroads oil field; Perdido oil field; Puss Cuss Creek oil field; Red Creek gas condensate field; Robinson Creek oil field; Silas oil field; Sizemore Creek gas condensate field; Smiths Church gas condensate field; South Burnt Corn Creek oil field; South Cold Creek oil field; South Vocation oil field; South Wild Fork Creek gas condensate field; South Womack Hill oil field; Southeast Chatom gas condensate field; Southwest Barrytown oil field; and Souwilpa Creek gas condensate field.

25582 (DOE/BC/14425–T13-App.I-Vol.2) **Establishment of an oil and gas database for increased recovery and characterization of oil and gas carbonate reservoir heterogeneity: Appendix 1, Volume 2.** Kopaska-Merkel, D.C.; Moore, H.E. Jr.; Mann, S.D.; Hall, D.R. Alabama Geological Survey, Tuscaloosa, AL (United States). Jun 1992. 221p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-89BC14425. Order Number DE93014667. Source: OSTI; NTIS; GPO Dep.

This volume contains maps, well logging correlated to porosity and permeability, structural cross section, graph of production history, porosity vs. natural log permeability plots, detailed core log, paragenetic sequence, and reservoir characterization sheet for the following fields in southwest Alabama: East Huxford oil field; Fanny Church oil field; Gin Creek oil field; Gulf Crest oil field; Hanberry Church oil field; Hatter's Pond oil field; Healing Springs gas condensate field; Huxford oil field; Little Escambia Creek oil field; Little River oil field; Little Rock gas condensate field; Lovetts Creek oil field; Melvin oil field; Mill Creek oil field; Mineola oil field; Movico oil field; and North Choctaw Ridge oil field.

25583 (DOE/BC/14475–12) **Geophysical and transport properties of reservoir rocks: Final report for task 4: Measurements and analysis of seismic properties.** Cook, N.G.W. California Univ., Berkeley, CA (United States). May 1993. 167p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89BC14475. Order Number DE93000139. Source: OSTI; NTIS; GPO Dep.

The principal objective of research on the seismic properties of reservoir rocks is to develop a basic understanding of the effects of rock microstructure and its contained pore fluids on seismic velocities and attenuation. Ultimately, this knowledge would be used to extract reservoir properties information such as the porosity, permeability, clay content, fluid saturation, and fluid type from borehole, cross-borehole, and surface seismic measurements to improve the planning and control of oil and gas recovery. This thesis presents laboratory ultrasonic measurements for three granular materials and attempts to relate the microstructural properties and the properties of the pore fluids to P- and S-wave velocities and attenuation. These experimental results show that artificial porous materials with sintered grains and a sandstone with partially cemented grains exhibit complexities in P- and S-wave attenuation that cannot be adequately explained by existing micromechanical theories. It is likely that some of the complexity observed in the seismic attenuation is controlled by details of the rock microstructure, such as the grain contact area and grain shape, and by the arrangement of the grain packing. To examine these effects, a numerical method was developed for analyzing wave propagation in a grain packing. The method is based on a dynamic boundary integ.al equation and incorporates generalized stiffness boundary conditions between individual grains to account for viscous losses and grain contact scattering.

25584 (DOE/BC–92/3) **Contracts for field projects and supporting research on enhanced oil recovery: Progress review No. 71, quarter ending June 30, 1992.** USDOE Bartlesville Project Office, OK (United States). Jun 1993. 138p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93000116. Source: OSTI; NTIS; GPO Dep.

Progress reports are presented for the following tasks: chemical flooding–supporting research; gas displacement–supporting research; thermal recovery–supporting research; geoscience technology; resource assessment technology; microbial technology; and novel technology. A list of available publication is also provided.

25585 (DOE/BC/14205–17) **Mechanism and environmental effects on MEOR induced by the alpha process: Final report.** Hiebert, F.K.; Zumberge, J.; Rouse, B.; Cowes, A.; Lake, L.W. Alpha Environmental Corp., Austin, TX (United States). Apr 1993. 114p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-88BC14205. Order Number DE93000133. Source: OSTI; NTIS; GPO Dep.

This project was an interdisciplinary investigation of the enhanced oil recovery effects of a commercial microbial enhanced oil recovery (MEOR) system. The purpose was to investigate in parallel laboratory and field studies the response of a portion of the Shannon Sandstone reservoir to two single-well treatments with a commercial MEOR system, to investigate basic bacteria/rock interactions, and to investigate mechanisms of oil release. The MEOR system consisted of a mixed culture of hydrocarbon-utilizing bacteria, inorganic nutrients, and other growth factors. Parallel field and laboratory investigations into the effect and mechanisms of the treatment were carried out by independent principal investigators. The Shannon Sandstone at the Naval Petroleum Reserve #3 (NPR #3), Teapot Dome Field, Wyoming, was the location of the pilot field treatment. The treated and adjacent observation wells showed production and microbiological perturbations that are attributed to the effects of treatment during the first four post-treatment months. Effects of treatment declined to background levels within four months of inoculation. No production response was recorded in control wells unaffected by microbial stimulation. Laboratory research resulted in descriptions of colonization patterns of hydrocarbon-utilizing bacteria in the reservoir rock environment. Core-flooding research utilizing various components of the MEOR system did not result in the isolation of an oilrelease mechanism or measure incremental oil recovery from cores at residual oil saturation to waterflood. Chemical analysis of pre- and post-treatment produced oil identified large organic acid molecules concentrated in the asphaltenic fraction of posttreatment oil, but not in the oil from untreated control wells. No significant changes were measured in the overall quality of the oil produced from MEOR treated wells.

25586 (DOE/BC/14425–T12) **Evaluation of enhanced recovery operations in Smackover fields of southwest Alabama: Draft topical report on Subtasks 5 and 6.** Hall, D.R. Alabama Geological Survey, Tuscaloosa, AL (United States). Jun 1992. 164p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-89BC14425. Order Number DE93014665. Source: OSTI; NTIS; GPO Dep.

This report contains detailed geologic and engineering information on enhanced-recovery techniques used in unitized Smackover fields in Alabama. The report also makes recommendations on the applicability of these enhanced-recovery techniques to fields that are not now undergoing enhanced recovery. Eleven Smackover fields in Alabama have been unitized. Three fields were unitized specifically to allow the drilling of a strategically placed well to recover uncontacted oil. Two fields in Alabama are undergoing waterflood projects. Five fields are undergoing gas-injection programs to increase the ultimate recovery of hydrocarbons. Silas and Choctaw Ridge fields were unitized but no enhanced-recovery operations have been implemented.

25587 (DOE/BC/14831–3) **Assist in the recovery of bypassed oil from reservoirs in the Gulf of Mexico: Quarterly report, January 1–March 30, 1993.** Schenewerk, P.A. Louisiana State Univ., Baton Rouge, LA (United States). Dept. of Petroleum Engineering. 30 Apr 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14831. Order Number DE93014534. Source: OSTI; NTIS; GPO Dep.

The objective of this research is to assist the recovery of non contacted oil from known reservoirs on the Outer Continental Shelf in the Gulf of,Mexico. Mature off shore reservoirs, declining oil reserves, declining production, and other natural forces are accelerating the abandonment of offshore oil resources and production platforms. As these offshore wells are plugged and the platforms are abandoned, an enormous volume of remaining oil will be permanently abandoned. Significant quantities of this oil could be recovered using advanced technologies now available if the resource can be identified. During this reporting period, ICF Resources Incorporated (ICF), a subcontractor for the project, continued to collect data from Minerals Management Service (MMS) and LSU continued to collect data from several operators. LSU also continued to modify BOAST II for the integration of radial grid systems and the building of the experimental apparatus for studying the recovery of attic oil. BDM Federal, Inc. (name changed from BDM International, Inc.) (BDM), a subcontractor for the project, began modifying the MASTER reservoir simulation model

for use in simulating miscible gas injection processes in steeply dipping reservoirs. LSU and BDM Federal. Inc. began analyzing data obtained from Taylor Energy in South Marsh 73 field.

25588 (DOE/FTR–93013086) **Travel to attend the International Energy Agency carbon dioxide symposium at Oxford, United Kingdom: Foreign trip report, March 27–April 3, 1993.** Bergman, P.D. USDOE Pittsburgh Energy Technology Center, PA (United States). 5 May 1993. 42p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93013086. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The author attended the International Energy Agency Carbon Dioxide Symposium held from March 29–April 1, 1993, at Oxford, United Kingdom and presented the paper "Availability of Depleted Oil and Gas Reservoirs for Disposal of Carbon Dioxide in the United States." The major conclusion of this meeting was that considerable progress has been made in establishing the technical feasibility of a diverse mix of robust site-specific CO_2 disposal options. The primary disposal options are subterranean disposal (abandoned oil and gas reservoirs and aquifers) and ocean disposal. Some other options of potential interest include enhanced oil recovery, the construction of dry ice spheres, and the use of aquatic biomass for CO_2 capture. The economic and ecological feasibility of these options remains to be proven. Bench-scale and pilot-scale experiments to test models and hypotheses should be emphasized at this early stage of development. However, a series of proof-of-concept experiments will have to eventually be performed. This entire effort should be carried out on an international basis as much as possible to reduce both the costs and risks associated with such experiments. In conclusion, there is no one, total, all-purpose, solution to the problem of end-of-pipe CO_2 sequestration. However, a series of site-specific solutions valid for the particular circumstances of individual countries appears to be attainable within a 5–20 year time frame.

25589 (DOE/ID/12842–2) **BOAST II for the IBM 3090 and RISC 6000: Final report.** Hebert, P.; Bourgoyne, A.T. Jr.; Tyler, J. Louisiana State Univ., Baton Rouge, LA (United States). May 1993. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-89ID12842. Order Number DE93000138. Source: OSTI; NTIS; GPO Dep.

Includes 1 3-1/2 in. floppy disk.

BOAST II simulates isothermal, darcy flow in three dimensions. It assumes that reservoir liquids can be described in three fluid phases (oil, gas, and water) of constant composition, with physical properties that depend on pressure, only. These reservoir fluid approximations are acceptable for a large percentage of the world's oil and gas reservoirs. Consequently, BOAST II has a wide range of applicability. BOAST II can simulate oil and/or gas recovery by fluid expansion, displacement, gravity drainage, and capillary imbibition mechanisms. Typical field production problems that BOAST II can handle include primary depletion studies, pressure maintenance by water and/or gas injection, and evaluation of secondary recovery waterflooding and displacement operations. Technically, BOAST II is a finite, implicit pressure, explicit saturation (IMPES) numerical simulator. It applies both direct and iterative solution techniques for solving systems of algebraic equations. The well model allows specification of rate or pressure constraints on well performance, and the user is free to add or to recomplete wells during the simulation. In addition, the user can define multiple rock and PVT regions and can choose from three aquifer models. BOAST II also provides flexible initialization, a bubble-point tracking scheme, automatic time-step control, and a material balance check on solution stability. The user controls output, which includes a run summary and line-printer plots of fieldwide performance.

25590 (DOE/MC/27351–3335) **Mathematical modeling and simulation analysis of hydraulic fracture propagation in three-layered poro-elastic media.** Moon, H.Y. (Ohio State Univ., Columbus, OH (United States)); Advani, S.H.; Lee, T.S. Lehigh Univ., Bethlehem, PA (United States). Nov 1992. 278p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG21-90MC27351. Order Number DE93000272. Source: OSTI; NTIS; GPO Dep.

Hydraulic fracturing plays a pivotal role in the enhancement of oil and gas production recovery from low permeability reservoirs. The process of hydraulic fracturing entails the generation of a fracture by pumping fluids blended with special chemicals and proppants into the payzone at high injection rates and pressures to extend and wedge fractures. The mathematical modeling of hydraulically induced fractures generally incorporates coupling between the formation elasticity, fracture fluid flow, and fracture mechanics equations governing the formation structural responses, fluid pressure profile, and fracture growth. Two allied unsymmetric elliptic fracture models are developed for fracture configuration evolutions in three-layered rock formations. The first approach is based on a Lagrangian formulation incorporating pertinent energy components associated with the formation structural responses and fracture fluid flow. The second model is based on a generalized variational principle, introducing an energy rate related functional. These models initially simulate a penny-shaped fracture, which becomes elliptic if the crack tips encounters (upper and/or lower) barriers with differential reservoir properties (in situ stresses, 16 elastic moduli, and fracture toughness-contrasts and fluid leak-off characteristics). The energy rate component magnitudes are determined to interpret the governing hydraulic fracture mechanisms during fracture evolution. The variational principle is extended to study the phenomenon and consequences of fluid lag in fractures. Finally, parametric sensitivity and energy rate investigations to evaluate the roles of controllable hydraulic treatment variables and uncontrollable reservoir property characterization parameters are performed. The presented field applications demonstrate the overall capabilities of the developed models. These studies provide stimulation treatment guidelines for fracture configuration design, control, and optimization.

25591 (DOE/METC/C–93/7085) **Site evaluation criteria for a horizontal well in the Clinton Sandstone, Mahoning County, Ohio.** Mroz, T.H. (USDOE Morgantown Energy Technology Center, WV (United States)); Thomas, J.B.; Schuller, W.A. USDOE Morgantown Energy Technology Center, WV (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). (CONF-9303178–1: 24. annual Appalachian petroleum geology symposium: innovative concepts in reservoir characterization, Morgantown, WV (United States), 29-31 Mar 1993). Order Number DE93015668. Source: OSTI; NTIS; GPO Dep.

A joint study between USDOE/METC and GRI was initiated to evaluate the application of horizontal wells for improving production from Clinton Sandstone reservoirs in eastern Ohio. A contract was awarded by USDOE/METC to Belden & Blake Inc. for drilling a horizontal well on their lease holdings in Mahoning Co., Ohio. Through a site evaluation study, reservoir and in situ stress characteristics were determined and well geometry designed. GRI contracted CER Corp. to drill a preliminary vertical well near the proposed horizontal well site to collect reservoir information and perform stress profile tests in the Clinton Sand reservoir and adjacent formations. USDOE and EG&G personnel worked with Belden and Blake, Inc. personnel to develop a 3-D geologic reservoir model. The geological model will be used as input parameters to reservoir simulation and production economic models to predict horizontal well effectiveness versus a conventional vertical well production at the selected site. This integrated effort is an example of the methodology that should be applied to the evaluation of a site prior to locating and designing a horizontal well. Realistically, an operator does not have the time nor money to drill a vertical well in an area for coring and stress testing the reservoir to determine natural fracture orientations and stress directions. Often these data can be obtained through published geologic literature on an area. However, natural and induced fracture orientations, reservoir properties (i.e. pressure, thickness, potential reserves) and the geologic environment are all key parameters for a successfully designed and oriented horizontal well.

25592 (LBL–33207) **Formation factor and the microscopic distribution of wetting phase in pore space of Berea sandstone.** Schlueter, E.M.; Myer, L.R.; Cook, N.G.W.; Witherspoon, P.A. Lawrence Berkeley Lab., CA (United States). Nov 1992. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098 ;AC22-89BC14475. Order Number DE93015287. Source: OSTI; NTIS; GPO Dep.

Experimental studies have been accomplished aimed at studying the formation factor of a partially saturated rock. The effective formation factors to an electrolyte solution of the pore spaces not occupied by a wetting raid (paraffin wax) have been measured at various saturations, after solidifying the wetting fluid in place. The experimental data is studied in light of the role of the pore structure on the wetting fluid invasion process with the aid of fluid distributions at each saturation regime, a complete rock pore cast, and its associated rock section. The effect of clay minerals on formation factor is studied. The surface conductance contribution of day minerals to overall electrical conductivity is assessed. The effect of partial hydrocarbon saturation on overall rock conductivity and on the Archei saturation exponent is discussed.

25593 (NIPER–646) **Techniques for mapping the types, volumes, and distribution of clays in petroleum reservoirs and for determining their effects on oil production: Final report.** Sharma, B. National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). May 1993. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-83FE60149. Order Number DE93000143. Source: OSTI; NTIS; GPO Dep.

This report presents the results of correlation of log signatures with information on distribution of the types and volumes of clays in sandstone pore spaces determined from detailed CT-scan, XRD, SEM, and thin section analyses of core samples from three sandstone reservoirs. The log signatures are then analyzed to determine if suitable mathematical/statistical parameter(s) could be calculated from the logs to determine their effects on permeability and oil production. The variability measures obtained from power spectral analysis of permeability and wireline log data in clayey formations have been correlated with oil production from two oil fields. Compared with the conventional measures of permeability variations like the Dykstra-Parsons coefficients, the new measure appears to correlate better with oil production.

25594 (NIPER–664) **[National Institute for Petroleum and Energy Research] 1991 annual report, October 1, 1990–September 30, 1991.** National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). May 1993. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-83FE60149. Order Number DE93000137. Source: OSTI; NTIS; GPO Dep.

This Annual Report provides research accomplishments, publications, and presentations resulting from the FY91 research conducted under the following Base Program projects: reservoir assessment and characterization; TORIS research support; three-phase relative permeability; imaging techniques applied to the study of fluids in porous media; development of improved microbial flooding methods; development of improved surfactant flooding methods; development of improved alkaline flooding methods; development of improved mobility- control methods; gas flooding; mobility control and sweep improvement in gas flooding; thermal processes for light oil recovery; thermal processes for heavy oil recovery; thermochemistry and thermophysical properties of organic nitrogen- and diheteroatom- containing compounds; and development of analytical methodology for analysis of heavy crudes.

25595 (NIPER–684) **National Institute for Petroleum and Energy Research quarterly technical report, January 1–March 31, 1993: Volume 2, Energy production research.** National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Jun 1993. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-83FE60149. Order Number DE93015566. Source: OSTI; NTIS; GPO Dep.

Accomplishments for the past quarter are briefly described for the following tasks: chemical flooding – supporting research; gas displacement – supporting research; thermal recovery – supporting research; geoscience technology; resource assessment technology; and microbial technology. Chemical flooding covers: surfactant flooding methods; development of improved alkaline flooding methods; mobility control and sweep improvement in chemical flooding; and surfactant-enhanced alkaline flooding field project. Gas displacement covers: gas flooding performance prediction improvement; and mobility control, profile modification and sweep improvement in gas flooding. Thermal recovery includes: thermal processes for light oil recovery; thermal processes for heavy oil recovery; and feasibility study of heavy oil recovery in the mid-continent region – Oklahoma, Kansas, and Missouri; simulation analysis of steam-foam projects; and field application of foams for oil production symposium. Geoscience technology covers: three-phase relative permeability; and imaging techniques applied to the study of fluids in porous media. Resource assessment technology includes: reservoir assessment and characterization; TORIS research support; upgrade the BPO crude oil analysis data base; and compilation and analysis of outcrop data from the Muddy and Almond Formations. Microbial technology covers development of improved microbial flooding methods; and microbial-enhanced waterflooding field project.

25596 (NIPER–690) **National Institute for Petroleum and Energy Research monthly progress report, May 1993.** National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Jun 1993. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-83FE60149. Order Number DE93016005. Source: OSTI; NTIS; GPO Dep.

Accomplishments for the month of May are described briefly under tasks for: Energy Production Research; Fuels Research; and Supplemental Government Program. Energy Production Research includes: reservoir assessment and characterization; TORIS research support; development of improved microbial flooding methods; development of improved chemical flooding methods; development of improved alkaline flooding methods; mobility control and sweep improvement in chemical flooding; gas flood performance prediction improvement; mobility control, profile modification, and sweep improvement in gas flooding; three-phase relative permeability research; thermal processes for light oil recovery; thermal processes for heavy oil recovery; and imaging techniques applied to the study of fluids in porous media. Fuels Research covers: development of analytical methodology for analysis of heavy crudes; and thermochemistry and thermophysical properties of organic nitrogen- and diheteratom-containing compounds. Supplemental Government Program covers: microbial-enhanced waterflooding field project; feasibility study of heavy oil recovery in the midcontinent region–Oklahoma, Kansas, and Missouri; surfactant-enhanced alkaline flooding field project; process-engineering property measurements on heavy petroleum components; development and application of petroleum production technologies; upgrade BPO crude oil data base; simulation analysis of steam-foam projects; DOE education initiative project; field application of foams for oil production symposium; technology transfer to independent producers; compilation and analysis of outcrop data from the Muddy and Almond formations; implementation of oil and gas technology transfer initiative; horizontal well production from fractured reservoirs; and chemical EOR workshop.

25597 (SAND–93-0811C) **Observations of broad-band micro-seisms during reservoir stimulation.** Sleefe, G.E.; Warpinski, N.R.; Engler, B.P. Sandia National Labs., Albuquerque, NM (United States). [1993]. 4p. Sponsored by Gas Research Inst., Chicago, IL (United States). DOE Contract AC04-76DP00789. Contract 5089-211-2059. (CONF-930901–1: Annual meeting of the Society of Exploration Geophysicists, Washington, DC (United States), 26-30 Sep 1993). Order Number DE93011668. Source: OSTI; NTIS; GPO Dep.

During hydrocarbon reservoir stimulation such as hydraulic fracturing, the cracking and slippage of the formation results in the emission of seismic energy. The objective of this study was to determine the properties of these induced micro-seisms. A hydraulic fracture experiment was performed in the Piceance Basin of Western Colorado to induce and record micro-seismic events. The formation was subjected to four processes; breakdown/ballout, step-rate test, KCL mini-fracture, and linear-gel mini-fracture. Micro-seisms were acquired with an advanced three-component wall-locked seismic accelerometer package, placed in an observation well 211 ft offset from the well. During the two hours of formation treatment, more than 1200 micro-seisms with signal-to-noise ratios in excess of 20 dB were observed. The observed micro-seisms had a nominally flat frequency from 100 Hz to 1500 Hz and lack the spurious tool-resonance effects evident in previous

attempts to measure micro-seisms. Both p-wave and s-wave arrivals are clearly evident in the data set, and hodogram analysis yielded coherent estimates of the event locations. This paper describes the characteristics of the observed micro-seismic events (event occurrence, signal-to-noise ratios, and bandwidth) and illustrates that the new acquisition approach results in enhanced detectability and event location resolution.

25598 (DOE/EIA–0340(92)/1) **Petroleum supply annual 1992: Volume 1.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 26 May 1993. 199p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014712. Source: OSTI; NTIS; GPO; INIS; GPO Dep.

The Petroleum Supply Annual (PSA) contains information on the supply and disposition of crude oil and petroleum products. The publication reflects data that were collected from the petroleum industry during 1992 through annual and monthly surveys. The PSA is divided into two volumes. This first volume contains four sections: Summary Statistics, Detailed Statistics, Refinery Capacity and Oxygenate Capacity each with final annual data. The second volume contains final statistics for each month of 1992, and replaces data previously published in the Petroleum Supply Monthly (PSM). The tables in Volumes 1 and 2 are similarly numbered to facilitate comparison between them.

25599 (DOE/EIA–0340(92)/2) **Petroleum supply annual 1992: Volume 2.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 27 May 1993. 598p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014713. Source: OSTI; NTIS; GPO; INIS; GPO Dep.

The Petroleum Supply Annual (PSA) contains information on the supply and disposition of crude oil and petroleum products. The publication reflects data that were collected from the petroleum industry during 1992 through annual and monthly surveys. The PSA is divided into two volumes. The first volume contains four sections: Summary Statistics, Detailed Statistics, Refinery Capacity, and Oxygenate Capacity each with final annual data. This second volume contains final statistics for each month of 1992, and replaces data previously published in the Petroleum Supply Monthly (PSM). The tables in Volumes 1 and 2 are similarly numbered to facilitate comparison between them. Explanatory Notes, located at the end of this publication, present information describing data collection, sources, estimation methodology, data quality control procedures, modifications to reporting requirements and interpretation of tables. Industry terminology and product definitions are listed alphabetically in the Glossary.

25600 (DOE/EIA–0380(93/05)) **Petroleum marketing monthly, May 1993.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 27 May 1993. 195p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014659. Source: OSTI; NTIS; GPO; GPO Dep.

The Petroleum Marketing Monthly is designed to give information and statistical data about a variety of crude oils and refined petroleum products. The publication provides statistics on crude oil costs and refined petroleum products sales for use by industry, government, private sector analysts, educational institutions, and consumers. Data on crude oil include the domestic first purchase price, the f.o.b. and landed cost of imported crude oil, and the refiners' acquisition cost of crude oil. Sales data for motor gasoline, distillates, residuals, aviation fuels, kerosene, and propane are presented.

25601 (DOE/EIA–0520(93/05)) **International petroleum statistics report, May 1993.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. 1 Jun 1993. 67p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93015207. Source: OSTI; NTIS; GPO Dep.

The International Petroleum Statistics Report presents data on international oil production, demand, imports, exports, and stocks. The report has four sections. Section 1 contains time series data on world oil production, and on oil demand and stocks in the Organization for Economic Cooperation and Development (OECD). This section contains annual data beginning in 1980, and monthly data for the most recent two years. Section 2 presents an oil supply/demand balance for world. This balance is presented in quarterly intervals for the most recent two years. Section 3 presents data on oil imports by OECD countries. This section contains annual data for the most recent year, quarterly data for the most recent two quarters, and monthly data for the most recent twelve months. Section 4 presents annual time series data on world oil production and oil stocks, demand, and trade for the years 1970 through 1992; OECD stocks from 1973 through 1992; and OECD trade from 1982 through 1992.

25602 (DOE/EIA–0538(92/93-27)) **Winter fuels report week ending, April 16, 1993.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 22 Apr 1993. 81p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012095. Source: OSTI; NTIS; GPO Dep.

The Winter Fuels Report is intended to provide concise, timely information to the industry, the press, policymakers, consumers, analysts, and State and local governments on the following topics: Distillate fuel oil net production, imports and stocks on a US level and for all Petroleum Administration for Defense Districts (PADD) and product supplied on a US level; propane net production, imports and stocks on a US level and for PADD's I, II, and III; natural gas supply and disposition and underground storage for the US and consumption for all PADD'S; as well as selected National average prices. Residential and wholesale pricing data for heating oil and propane for those States participating in the joint Energy Information Administration (EIA)/State Heating Oil and Propane Program; crude oil and petroleum price comparisons for the US and selected cities; and a 6–10 Day, 30-Day, and 90-Day outlook for temperature and precipitation and US total heating degree-days by city.

25603 (DOE/EIA–0538(92/93-29)) **Winter fuels report, week ending April 30, 1993.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 6 May 1993. 70p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012826. Source: OSTI; NTIS; GPO Dep.

25604 (DOE/ID/01570–T164) **Alaska North Slope National Energy Strategy initiative: Analysis of five undeveloped fields.** Thomas, C.P.; Allaire, R.B.; Doughty, T.C.; Faulder, D.D.; Irving, J.S.; Jamison, H.C.; White, G.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1993. 348p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93000142. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy was directed in the National Energy Strategy to establish a federal interagency task force to identify specific technical and regulatory barriers to the development of five undeveloped North Slope Alaska fields and make

recommendations for their resolution. The five fields are West Sak, Point Thomson, Gwydyr Bay, Seal Island/Northstar, and Sandpiper Island. Analysis of environmental, regulatory, technical, and economic information, and data relating to the development potential of the five fields leads to the following conclusions: Development of the five fields would result in an estimated total of 1,055 million barrels of oil and 4.4 trillion cubic feet of natural gas and total investment of $9.4 billion in 1992 dollars. It appears that all five of the fields will remain economically marginal developments unless there is significant improvement in world oil prices. Costs of regulatory compliance and mitigation, and costs to reduce or maintain environmental impacts at acceptable levels influence project investments and operating costs and must be considered in the development decision making process. The development of three of the fields (West Sak, Point Thomson, and Gwydyr Bay) that are marginally feasible would have an impact on North Slope production over the period from about 2000 to 2014 but cannot replace the decline in Prudhoe Bay Unit production or maintain the operation of the Trans-Alaska Pipeline System (TAPS) beyond about 2014 with the assumption that the TAPS will shut down when production declines to the range of 400 to 200 thousand barrels of oil/day. Recoverable reserves left in the ground in the currently producing fields and soon to be developed fields, Niakuk and Point McIntyre, would range from 1 billion to 500 million barrels of oil corresponding to the time period of 2008 to 2014 based on the TAPS shutdown assumption.

25605 (INIS-mf–13562) **Qatar's economy transition from oil based economy to gas based economy.** Sastry, G.R.N. Ministry of Energy and Industry, Doha (Qatar). 1993. [11p.] Order Number DE93631670. Source: OSTI; NTIS (US Sales Only); INIS.

The historical aspects of petroleum industry development in Qatar are reviewed. Evaluation of Qatar's oil and natural gas reserves and production capacities is outlined. Trends of petroleum, petrochemical and gas industry further development are discussed. (V.G.).

25606 (SAND–93-0824C) **Application of EM holographic methods to borehole vertical electric source data to map a fuel oil spill.** Bartel, L.C. Sandia National Labs., Albuquerque, NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930901–3: Annual meeting of the Society of Exploration Geophysicists, Washington, DC (United States), 26-30 Sep 1993). Order Number DE93011666. Source: OSTI; NTIS; INIS; GPO Dep.

The multifrequency, multisource holographic method used in the analysis of seismic data is to extended electromagnetic (EM) data within the audio frequency range. The method is applied to the secondary magnetic fields produced by a borehole, vertical electric source (VES). The holographic method is a numerical reconstruction procedure based on the double focusing principle for both the source array and the receiver array. The approach used here is to Fourier transform the constructed image from frequency space to time space and set time equal to zero. The image is formed when the in-phase part (real part) is a maximum or the out-of-phase (imaginary part) is a minimum; i.e., the EM wave is phase coherent at its origination. In the application here the secondary magnetic fields are treated as scattered fields. In the numerical reconstruction, the seismic analog of the wave vector is used; i.e., the imaginary part of the actual wave vector is ignored. The multifrequency, multisource holographic method is applied to calculated model data and to actual field data acquired to map a diesel fuel oil spill.

25607 (UCRL-JC–110348) **Dynamic Underground Stripping Engineering Demonstration Project: Construction, operation and engineering results.** Siegel, W.H. (Lawrence Livermore National Lab., CA (US)); Buettner, H.M.; Udell, K.S. Lawrence Livermore National Lab., CA (United States). May 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920851–97: Spectrum '92: nuclear and hazardous waste management international topical meeting, Boise, ID (United States), 23-27 Aug 1992). Order Number DE93017180. Source: OSTI; NTIS; INIS; GPO Dep.

The Dynamic Underground Stripping Project demonstrates cost-effective, rapid cleanup of localized underground plumes, often the result of leaking underground storage tanks. The technique combines the complementary technologies of subsurface steam injection and electrical resistance heating. The engineering demonstration phase of this project was completed on a clean, uncontaminated site with well- characterized geology. The Clean Site is located in Livermore, California at the US Department of Energy's Sandia National Laboratory (SNL). The experience gained at the Clean Site will be applied to clean up an 8,000 to 12,000 gallon gasoline spill, approximately 500 yards to the northwest, at the Lawrence Livermore National Laboratory (LLNL).

25608 (SAND–93-0706C) **The effects of latex additions on centrifugally cast concrete for internal pipeline protection.** Buchheit, R.G. (Sandia National Labs., Albuquerque, NM (United States)); Hinkebein, T.E.; Hlava, P.F.; Melton, D.G. Sandia National Labs., Albuquerque, NM (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9309150–5: 12. international corrosion congress, Houston, TX (United States), 19-24 Sep 1993). Order Number DE93016495. Source: OSTI; NTIS; GPO Dep.

Centrifugally-cast concrete liners applied to the interiors of plain steel pipe sections were tested for corrosion performance in brine solutions. An American Petroleum Institute (API) standard concrete, with and without additions of a styrene-butadiene copolymer latex, was subjected to simulated service and laboratory tests. Simulated service tests used a mechanically pumped test manifold containing sections of concrete-lined pipe. Linear polarization probes embedded at steel-concrete interfaces tracked corrosion rates of these samples as a function of exposure time. Laboratory tests used electrochemical impedance spectroscopy to study corrosion occurring at the steel-concrete interfaces. Electron probe microanalysis (EPMA) determined ingress and distribution of damaging species, such as Cl, in concrete liners periodically returned from the field. Observations of concrete-liner fabrication indicate that latex loading levels were difficult to control in the centrifugal-casting process. Overall, test results indicate that latex additions do not impart significant improvements to the performance of centrifugally cast liners and may even be detrimental. Corrosion at steel-concrete interfaces appears to be localized and the area fraction of corroding interfaces can be greater in latex-modified concretes than in API baseline material. EPMA shows higher interfacial Cl concentration in the latex-modified concretes than in the API standard due to rapid brine transport through cracks to the steel surface.

03 NATURAL GAS

25609 (DOE/METC/C–93/7064) **Overview of the DOE/METC Natural Gas Program.** Layne, A.W. Department of Energy, Morgantown, WV (United States). Morgantown Energy Technology Center. [1993]. 21p. Sponsored by USDOE, Washington, DC (United States). (CONF-9301108–1: United States Geological

workshop on future of energy gases, Palo Alto, CA (United States), 30-31 Jan 1993). Order Number DE93013484. Source: OSTI; NTIS; GPO Dep.

The mission of the US Department of Energy's (DOE) natural gas program is to enhance the Nation's energy security, economic growth and efficiency, and environmental quality. This mission will be accomplished by removing barriers to the expanded use of domestic natural gas; development of economic and environmentally efficient, reliable natural gas supply, storage, transportation, and utilization technologies; and improving competition and technology transfer. The Morgantown Energy Technology Center (METC) supports the DOE Natural Gas mission through research, development, - and demonstration (RD&D), of natural gas supply and utilization technologies. Projects are structured to foster eventual industry commercialization of the technologies. METC's RD&D is integrated with projects and activities being sponsored by other funding organizations. Goals of METC's program include increasing user confidence in long term supply of natural gas and verification of adequate gas reserves; and development and commercialization of high efficiency, cost-effective extraction and utilization technologies. METC's program also includes gas utilization projects on advanced gas turbine systems, fuel cells, and on processes to convert natural gas to liquid products. METC's vision for the year 2010 is the following: Natural gas recovery and environmental technologies will insure a reliable US natural gas supply of at least 23 trillion cubic feet (Tcf) per year from both conventional and nonconventional resources; for the utility market, advanced turbine systems operating on natural gas have been demonstrated and are available commercially; fuel cells and small advanced combustion turbine systems supply a distributed power market with natural gas fueled devices in the 1 to 50 megawatt electrical (MWe) range while the 50 MWe size range are being commercialized in the large industrial and commercial cogeneration markets.

0302 Reserves, Geology, and Exploration

25610 (DOE/METC/C–93/7069) **Overview: Gas hydrate geology and geography.** Malone, R.D. USDOE Morgantown Energy Technology Center, WV (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). (CONF-930687–2: International conference on natural gas hydrates, New Paltz, NY (United States), 20-24 Jun 1993). Order Number DE93014043. Source: OSTI; NTIS; GPO Dep.

Several geological factors which are directly responsible for the presence or absence of gas hydrates have been reviewed and are: tectonic position of the region; sedimentary environments; structural deformation; shale diapirism; hydrocarbon generation and migration; thermal regime in the hydrate formation zone (HFZ); pressure conditions; and hydrocarbon gas supply to the HFZ. Work on gas hydrate formation in the geological environment has made significant advances, but there is still much to be learned. Work is continuing in the deeper offshore areas through the Ocean Drilling Program, Government Agencies, and Industry. The pressure/temperature conditions necessary for formation has been identified for various compositions of natural gas through laboratory investigations and conditions for formation are being advanced through drilling in areas where gas hydrates exist.

25611 (DOE/METC/C–93/7070) **Hydrate characterization research overview.** Malone, R.D. USDOE Morgantown Energy Technology Center, WV (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). (CONF-930687–1: International conference on natural gas hydrates, New Paltz, NY (United States), 20-24 Jun 1993). Order Number DE93014039. Source: OSTI; NTIS; GPO Dep.

Gas hydrate research has been focused primarily on the development of a basic understanding of hydrate formation and dissociation in the laboratory, as well as in the field. Laboratory research on gas hydrates characterized the physical system, which focused on creating methane hydrates samples, tetrahydrofuran (THF) hydrate samples, consolidated rock samples, frost base mixtures, water/ice-base mixtures, and water-base mixtures. Laboratory work produced measurements of sonic velocity and electrical resistivity of hydrates. As work progressed, areas, such as the Gulf of Mexico and the Guatemala Trench, where gas hydrates are likely to occur were identified, and specific high potential areas were targeted for detailed investigation. The testing of samples and recovered cores from such areas provided information for detection of hydrate formations in the natural environment. Natural gas hydrate samples have been tested for thermal properties, dissociation properties, fracture mechanics, and optical properties. Acoustical properties were investigated both in the laboratory and, as possible, in the field. Sonic velocity and electrical resistivity measurements will continue to be obtained. These activities have been undertaken in hydrate deposits on Alaska's North Slope, the Gulf of Mexico and the US East coast offshore, as well as other gas hydrate target areas.

25612 (DOE/MC/27351–3336) **Application of characteristic time concepts for hydraulic fracture configuration design, control, and optimization: Final report.** Advani, S.H. (Lehigh Univ., Bethlehem, PA (United States)); Lee, T.S.; Moon, H. Lehigh Univ., Bethlehem, PA (United States). Oct 1992. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG21-90MC27351. Order Number DE93000270. Source: OSTI; NTIS; GPO Dep.

The analysis of pertinent energy components or affiliated characteristic times for hydraulic stimulation processes serves as an effective tool for fracture configuration designs optimization, and control. This evaluation, in conjunction with parametric sensitivity studies, provides a rational base for quantifying dominant process mechanisms and the roles of specified reservoir properties relative to controllable hydraulic fracture variables for a wide spectrum of treatment scenarios. Results are detailed for the following multitask effort: (a) Application of characteristic time concept and parametric sensitivity studies for specialized fracture geometries (rectangular, penny-shaped, elliptical) and three-layered elliptic crack models (in situ stress, elastic moduli, and fracture toughness contrasts). (b) Incorporation of leak-off effects for models investigated in (a). (c) Simulation of generalized hydraulic fracture models and investigation of the role of controllable vaxiables and uncontrollable system properties. (d) Development of guidelines for hydraulic fracture design and optimization.

25613 (DOE/METC/C–93/7068) **Upgrading of raw natural gas using high-performance polymer membranes.** Stern, S.A. (Syracuse Univ., NY (United States)); Meyer, H.S.; Venkataraman, V.K.; Shoemaker, H.D. USDOE Morgantown Energy Technology Center, WV (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). (CONF-9305166–2: American Filtration Society seminar and expo annual meeting, Chicago, IL (United States), 3-6 May 1993). Order Number DE93014041. Source: OSTI; NTIS; GPO Dep.

The separation of CO_2 and H_2S from raw natural gas is essential for enhancing the heating value of the gas and for providing environmental safety during nation and use. Membrane separation processes are particularly useful for this application because they are inherently energy-efficient. Membrane processes also offer other important advantages, such as ease of scale-up due to module design, good space and weight efficiency and great flexibility in handling variations in the flow rate, pressure and composition of the raw natural gas streams. In a coordinated effort, the Gas Research Institute and the Department of Energy, Morgantown Energy Technology Center are funding an extensive study at Syracuse University on the relationships between the chemical structure of various polymers and their permeability to different gases. Based on criteria derived from this study, novel fluorine-containing polyimides that exhibit very high CO_2/CH_4, selectivities as well as significant H_2S/CH_4, selectivities were synthesized. These "dense" (homogeneous) membranes separated various mixtures of CO_2/CH_4, and $H_2S/CH_4/CO_2$ at 35°C (95°F) and at pressures up to 10 atm (147 psi). The results of these measurements agree well with computer simulations. The $C0_2$ content of CH_4/CO_2 mixtures containing as much as 40 mole percent $C0_2$ can be reduced with the

polyamide membranes to pipeline specifications ($\leq$ 2 mole percent CO_2). To reduce the H_2S content of $H_2S/CH_4/CO_2$ mixtures to pipeline specifications ($\leq$ 4 ppM H_2S), the membranes are best combined with conventional gas-absorption processes, such as a selective amine. Such "hybrid" processes for the upgrading of natural gas can be more economical than conventional gas-absorption processes alone.

25614 (SAND–93-7039) **Multi-Site Project seismic verification experiment and assessment of site suitability.** Middlebrook, M. (CER Corp., Las Vegas, NV (US)); Peterson, R.; Warpinski, N.; Engler, B.; Sleefe, G.; Cleary, M.; Wright, T.; Branagan, P. Sandia National Labs., Albuquerque, NM (United States); Gas Research Inst., Chicago, IL (United States); CER Corp., Las Vegas, NV (United States); Resources Engineering Systems, Inc., Cambridge, MA (United States). Feb 1993. 106p. Sponsored by Gas Research Inst., Chicago, IL (United States). DOE Contract AC04-76DP00789. (GRI–93/0050). Order Number DE93015631. Source: OSTI; NTIS; GPO Dep.

The Multi-Site Project (M-Site No. 1) has been proposed as a means of resolving the significant unknowns associated with measuring and modeling the dimensions of hydraulic fractures. The proposed project would be performed using three existing wellbores associated with the former DOE Multiwell Experiment (MWX), as well as new wellbores drilled on the same site. The site initially appeared attractive because of: (1) multiple thick, laterally-continuous sandstone units present in the upper Mesaverde Group; (2) comprehensive, existing data sets which resulted from the MWX project; (3) the availability of the MWX wellbores for continued research; and (4) existing infrastructure which would facilitate the implementation of the project. However, before proceeding with full-scale project development, a series of assessments were necessary to definitively determine the suitability of the site from various perspectives. These perspectives included: (1) evaluation of confining stresses of the sandstone units; (2) assessment of wellbore (cement and casing) integrity; and (3) capability of remotely detecting seismic signals during a mini-frac. The site suitability assessments performed involved the use of existing stress data from the MWX wells and the acquisition of new seismic and fracture treatment data collected during field operations conducted in September and October 1992. These assessments concluded that the mechanical wellbore conditions, background seismic noise, seismic signal attenuation, remote seismic signal detection, stress contrast and hydraulic fracture pressure response clearly show that the MWX site is suitable for future fracture diagnostics experimentation to be conducted by GRI and DOE.

25615 (DOE/EIA–0130(93/05)) **Natural gas monthly, May 1993.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 25 May 1993. 131p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014382. Source: OSTI; NTIS; GPO; GPO Dep.

The Natural Gas Monthly (NGM) is prepared in the Data Operations Branch of the Reserves and Natural Gas Division, Office of Oil and Gas, Energy Information Administration (EIA), US Department of Energy (DOE). The NGM highlights activities, events, and analyses of interest to public and private sector organizations associated with the natural gas industry. Volume and price date are presented each month for natural gas production, distribution, consumption, and interstate pipeline activities. Producer-related activities and underground storage data are also reported. From time to time, the NGM features articles designed to assist readers in using and interpreting natural gas information.

25616 (INIS-mf–13563) **The natural gas resources and industrial development in Qatar.** Qatar General Petroleum Corporation, Doha (Qatar). Oct 1992. [33p.] (CONF-9210377–: 2. conference on industrial cooperation between Arab Gulf states and European community, Doha (Qatar), 25 Oct 1992). Order Number DE93631689. Source: OSTI; NTIS (US Sales Only); INIS.

The presentation highlights aspects of the historic and present role of natural gas in Qatar, the current and future stages of the North Field Gas development and its utilization prospects. (V.G.).

0308 Environmental Aspects

25617 (INIS-mf–13564) **Status of energy intensive industrial development and ecological aspects of State of Qatar.** Al-Emadi, Y. Ministry of Energy and Industry, Doha (Qatar). Dept. of Industrial Development. [1993]. [11p.] (CONF-9304173–: Energy management and environment, Pilzen (Czech Republic), 20 Apr 1993). Order Number DE93630838. Source: OSTI; NTIS (US Sales Only); INIS.

The existing oil reserves in Qatar are likely to be exhausted within 20-30 years, but Qatar is fortunate to have large natural gas reserves on which future industrial development will be based. This document briefly reviews the Qatar North Field Gas Project.

0310 Legislation and Regulations

25618 (ANL/EAIS/CP–79499) **State policies affecting natural gas consumption (Notice of inquiry issued on August 14, 1992): Summary of comments.** Lemon, R.; Kamphuis-Zatopa, W. Argonne National Lab., IL (United States). 25 Mar 1993. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930495–1: DOE/NARUC national conference on natural gas use: state regulation and market dynamics in the post-636/Energy Policy Act, Era, New Orleans, LA (United States), 26-28 Apr 1993). Order Number DE93012879. Source: OSTI; NTIS; INIS; GPO Dep.

On August 14, 1992, the United States Department of Energy issued a Request for Comments Concerning State Policies Affecting Natural Gas Consumption. This Notice of (NOI) noted the increasing significance of the role played by states and sought to gain better understanding of how state policies impact the gas industry. The general trend toward a. more competitive marketplace for natural gas, as well as recent regulatory and legislative changes at the Federal level, are driving State regulatory agencies to reevaluate how they regulate natural gas. State action is having a significant impact on the use of natural gas for generating electricity, as well as affecting the cost-effective trade-off between conservation expenditures and gas use. Additionally, fuel choice has an impact upon the environment and national energy security. In light of these dimensions, the Department of Energy initiated this study of State regulation. The goals of this NOI are: (1) help DOE better understand the impact of State policies on the efficient use of gas; (2) increase the awareness of the natural gas industry and Federal and State officials to the important role of State policies and regulations; (3) create an improved forum for dialogue on State and Federal natural gas issues; and, (4) develop a consensus on an analytical agenda that would be most helpful in addressing the regulatory challenges faced by the States. Ninety-seven parties filed comments, and of these ninety-seven, fifteen parties filed reply comments. Appendix One lists these parties. This report briefly syntheses the comments received. The goal is to assist parties to judging the extent of consensus on the problems posed and the remedies suggested, aid in identifying future analytical analyses, and assist parties in assessing differences in strategies and regulatory philosophies which shape these issues and their resolution.

25619 (NEI-DK–1186) **Use of natural gas in a shaft furnace for led smelting.** Lundborg, B. (Sydkraft Konsult (Sweden)). Nordisk Gasteknisk Center, Hoersholm (Denmark). Mar 1992. 14p. (In Swedish). Order Number DE93500135. Source: OSTI; NTIS.

Boliden Bergsoee AB is a Swedish company specializing in refining and recycling of non-iron metals. In the actual process lead is recycled from lead-batteries by reduction in a shaft-furnace. The furnace is charged with a mixture of scrap-lead and coke. The

coke is to serve as energy supplement and also as reduction material. The aim of the project is to investigate and evaluate if it is possible to replace 50% or more of the coke in the furnace with natural gas. The benefits could among others be increased productivity, clean and efficient utilization and simplified preheating of air which all reduces the costs. (au).

04 OIL SHALES AND TAR SANDS

0409 Waste Management

25620 (UCRL-JC–110320-Pt.2) **Catalytic activity of oxidized (combusted) oil shale for removal of nitrogen oxides with ammonia as a reductant in combustion gas streams, Part 2.** Reynolds, J.G.; Taylor, R.W.; Morris, C.J. Lawrence Livermore National Lab., CA (United States). 4 Jan 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921142–8-Pt.2: Eastern oil shale symposium, Lexington, KY (United States), 13-15 Nov 1992). Order Number DE93012586. Source: OSTI; NTIS; GPO Dep.

Oxidized oil shale from the combustor in the LLNL Hot-Recycled-Solids (HRS) oil shale retorting process has been found to be a catalyst for removing nitrogen oxides from laboratory gas streams using NH_3 as a reductant. Oxidized Green River oil shale heated at 10°C/min in an $Ar/O_2/NO/NH_3$ mixture (~93%/6%/2000 ppM/4000 ppM) with a gas residence time of ~0.6 sec removed NO between 250 and 500°C, with maximum removal of 70% at ~400°C. Under isothermal conditions with the same gas mixture, the maximum NO removal was ~64%. When CO_2 was added to the gas mixture at ~8%, the NO removal dropped to ~50%. However, increasing the gas residence time to ~1.2 sec, increased NO removal to 63%. Nitrogen balances of these experiments suggest selective catalytic reduction of NO is occurring using NH_3 as the reductant. These results are not based on completely optimized process conditions, but indicate oxidized oil shale is an effective catalyst for NO removal from combustion gas streams using NH_3 as the reductant. Parameters calculated for implementing oxidized oil shale for NO_x remediation on the current HRS retort indicate an abatement device is practical to construct.

05 NUCLEAR FUELS

0501 Reserves, Exploration, and Mining

25621 (EGG-M–93095) **Mineral bioprocessing.** Torma, A.E. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9303162–1: International conference and workshop on applications of biotechnology to the minerals industry, Adelaide (Australia), 22-23 Mar 1993). Order Number DE93013678. Source: OSTI; NTIS; GPO Dep.

In the last 25 years, the introduction of biotechnological methods in hydrometallurgy has created new opportunities and challenges for the mineral processing industry. This was especially true for the production of metal values from mining wastes and low-and-complex-grade mineral resources, which were considered economically not amenable for processing by conventional extraction methods. Using bio-assisted heap, dump and in-situ leaching technologies, copper and uranium extractions gained their first industrial applications. The precious metal industries were the next to adopt the bio-preoxidation technique in the extraction of gold from refractory sulfide-bearing ores and concentrates. A variety of other bioleaching opportunities exist for nickel, cobalt, cadmium and zinc sulfide leaching. Recently developed bioremediation methods and biosorption technologies have shown a good potential for industrial applications to remove trace heavy metal and radionuclide concentrations from contaminated soils, and mining and processing effluents.

The need to recover the Pu existing in the Alpha Facility for the experimental fabrication of mixed oxides fuel elements $(U,Pu)O_2$, its recovery has been set up from the F_4Pu available at the laboratory. To fulfill the strict specifications on fluorides in nuclear fuels, it was necessary to precisely adjust the purification phase. This paper describes the chemical process for the PuO_2 obtainment from F_4Pu. F_4Pu was dissolved in nitric acid, adding aluminium nitrate. The concentration in the medium decreases due to the complexes formation with fluorides and this allows the full dissolution of the salt. Pu separation was carried out by the treatment with RESINE DOWEX in columns. After purification with successive washes in NO_3H_7M, Pu elution retained in the column was performed. Finally, it precipitated as Pu IV oxalate and PuO_2 was obtained by calcination at 700 deg C. (Author).

25624 (INIS-mf–12758, pp. 395-399) **Control of criticality risk in the manufacture of fuel elements for research reactors.** Friedenthal, M. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Dept. de Combustibles Nucleares); Cardenas Yucra, H.R.; Marajofsky, A.; La Gamma de Batistoni, A.M. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The control of criticality risk in a chemical plant adopts different forms according to the quantities of fissile material and the type of compounds used. This work presents the treatment of the critical excursion risk adopted in production plants of U_3O_8 and manufacturing plants of fuel elements for research reactors, located in Constituyentes Atomic Center. The possible events and accidents related to the fissile material control are analyzed, and the systems of administrative control and intrinsic safety through engineering are described. (Author).

25625 (IPEN-PUB–373) **Thermogravimetry for optimization of chloride pyro hydrolytic separations in zirconia-magnesia**

matrix. Pires, M.A.F.; Dantas, E.S.K. Instituto de Pesquisas Energeticas e Nucleares (IPEN), Sao Paulo, SP (Brazil). Aug 1992. [25p.] (In Portuguese). (CONF-9203266–: French-Brazilian Materials Sciences Symposium, Ouro Preto (Brazil), 16-21 Mar 1992). Order Number DE93629070. Source: OSTI; NTIS (US Sales Only); INIS.

A fast and accurate method for chloride ion determination in zirconia-magnesia matrix was studied the method consists in the pyro hydrolysis of the oxides at 900° C, using a quartz apparatus, during thirty minutes and further determination of the chloride ion collected by means of either ion-selective electrode or ion chromatography. The thermogravimetric curves (TG curves) of the metal oxides and oxychlorides provide all the information about the chloride ion evolution temperature and the influence of pyro hydrolytic accelerators ($U_3 O_8$) on ion evolution. (author).

25626 (KAERC–502/89) **Investigation of extractive separation of uranium and vanadium from sulphuric acid leaching liquors of uranium ore (1): Extractive property of HDEHP.** Han Hi Jong. Ministry of Atomic Energy, Pyongyang (Korea, Democratic People's Republic of). Research Center for Atomic Energy. Feb 1989. [6p.] (In Korean). Order Number DE93627689. Source: OSTI; NTIS (US Sales Only); INIS.

Condition of extractive separation of U and V from sulphuric acid leaching liquors of uranium ore by HDEHP was confirmed. For high selectivity of uranium extraction concentration of solvent, phase contact time and pH of aqueous solution must be decreased. To increase extractive capacity of vanadium, above indices have to be increased reversibly. Capacity of HDEHP for U is 80-100g/mol, for V 17-21g/mol. (Author).

25627 (KAERC–503/89) **Investigation of extractive separation of uranium and vanadium from sulphuric acid leaching liquors of uranium ore (2): Reduction of Fe(III) from sulphuric acid.** Han Hi Jong. Ministry of Atomic Energy, Pyongyang (Korea, Democratic People's Republic of). Research Center for Atomic Energy. Feb 1989. [9p.] (In Korean). Order Number DE93627690. Source: OSTI; NTIS (US Sales Only); INIS.

Reduction condition of Fe(III) to extract uranium and vanadium with HDEHP from sulphuric acid leaching liquors of uranium ore was examined. It was shown that in the system of oxidation-reduction consisted of many ionic pairs can reduce Fe(III) with iron scraps selectively and at this time factors affected on its reduction is hydro-ionic concentration in solution and diffusion factor. (Author).

25628 (KAERC–504/89) **Study of the influence of factors on the adsorption co-precipitation of the uranium with calcium hydroxide.** Li Goon Dae. Ministry of Atomic Energy, Pyongyang (Korea, Democratic People's Republic of). Research Center for Atomic Energy. Feb 1989. [8p.] (In Korean). Order Number DE93627691. Source: OSTI; NTIS (US Sales Only); INIS.

By observing the influence of factors on the adsorption co-precipitation of the uranium with calcium hydroxide, a formula was obtained, by which uranium concentration is determined in the adsorption co-precipitation mother liquor. This relation allows us to predict uranium concentration in the adsorption co-precipitation mother liquor according to quantity of the co-precipitator and helps practical purifying. (Author).

25629 (KAERC–505/89) **Investigation of recovery of nickel from raffinate treated uranium ore.** Kim Song Soon; Baek Myong Goon; Kim Yong Taek. Ministry of Atomic Energy, Pyongyang (Korea, Democratic People's Republic of). Research Center for Atomic Energy. Feb 1989. [8p.] (In Korean). Order Number DE93627692. Source: OSTI; NTIS (US Sales Only); INIS.

Condition of separation and formation of ion $(Ni(NH_3)_n)^{2+}$ from raffinate treated uranium ore was confirmed experimently. Condition to convert nickel from raffinate into ammoniacal complex is as follows: pH 9.4-10. Concentration of all ammonia 2.18 M. When adsorbing complex with sulphonate cation exchanger, rate of recovery is over 95% in counter current 6 stage. (Author).

25630 (CEA-CONF–11307) **Atomic vapor laser isotope separation in France.** Camarcat, N.; Lafon, A.; Perves, J.P.; Rosengard, A. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. des Procedes d'Enrichissement. 1992. [12p.] (CONF-9208222–: 3. International Workshop on Separation Phenomena in Liquids and Gases, Charlottesville, VA (United States), 18 Aug 1992). Order Number DE93630996. Source: OSTI; NTIS (US Sales Only); INIS.

The main effort in the field of Isotopic Separation Research and Development in France is devoted since 1985 to the 'SILVA' process. A structured organization has been set up, including the following elements: Specific Research and Development for all the functions and components of the process: this work is supported by numerous benches located in Saclay and Pierrelatte. Each bench is mainly devoted to one process function; regarding process and operating performances are optimized. Integrated Experiences in a Pilot facility. Qualified components are integrated in a pilot facility located in Saclay, the capacity of which is steadily increased. At each stage, complete separative experiments demonstrate the improvements attained. Focused Basic Research for each field, often linked with various and relatively original phenomenas. Models have been built up, supported by specific experiments and values attained for intrinsical parameters. An aggregated process performance computing code integrates all the models, possibly under simplified form. Technical, operating and economical data are gradually added. A general assessment will take place in the middle of the nineties with several technical demonstrations and a complete evaluation of the French AVLIS process.

25631 (INIS-mf–12758, pp. 400-407) **Inventory control through gamma spectrometry at the enriched uranium laboratory.** Vicens, H.E. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Procesos Quimicos); Korob, R.O.; Goldschmidt, A.E. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The enriched uranium laboratory processes alternatively uranium 90% and 20% enriched in U-235. The control of the isotopic composition of lots is made through mass spectrometry. In the laboratory operation wastes of both enrichments are generated and the recovery is performed with a time delay. To strengthen the administrative controls, avoid errors related to personnel replacement and/or deferred operations, it seemed suitable to adjust the gamma spectrometry as a fast, simple and available method to determine the enrichment. The laboratory work includes a wet and a dry process. The waste recovery necessarily involves the handling of liquid samples. For this reason, it was decided to determine the calibration curve for uranyl nitrate samples of fixed concentration and geometry. The samples were prepared from material purified through double precipitation of uranium peroxide and subsequent ignition to $U_3 O_8$ in platinum crucible, in tubular oven during 8 hours at 720 deg C. The preparation of samples, the measurement description, the discussion of results and the analysis of errors due to the presence of insoluble material and concentration changes are included. (Author).

25632 (ORNL/TM–12234) **Switchover software reliability estimate for Paducah Freezer/Sublimer computer systems.** Flanagan, D.M.; Davis, J.N. Oak Ridge National Lab., TN (United States). Apr 1993. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013844. Source: OSTI; NTIS; GPO Dep.

K-25 Engineering Division purchased a series of redundant computer systems and developed software for the purpose of providing continuous process monitoring and control for the Freezer/Sublimer equipment in the gaseous diffusion process at the Paducah Gaseous Diffusion Plant. The application software is loaded on two central processing units (CPU) so that in the event of a failure of the primary unit, the processing can switch to the backup unit and

continue processing without error. It is the purpose of this document to demonstrate the reliability of this system with respect to its ability to switch properly between redundant CPU. The total reliability estimation problem – which considers the computer hardware, the operating system software, and the application software – has been reduced to one that considers only the application software directly involved in the switchover process. Estimates are provided for software reliability and the testing coverage. Software and hardware reliability models and reliability growth models are considered in addition to Bayesian approaches.

From American Nuclear Society meeting; Nashville, TN (United States); 19-23 Sep 1993. Order Number DE93013515. Source: OSTI; NTIS; GPO Dep.

A near spherical unreflected and unmoderate uranium (93.7) metal configuration had been assembled to delayed criticality at Los Alamos National Laboratory in the 1950's. Experiments with highly enriched uranium metal spherical shells had also been assembled. Both these experiments have been used to estimate the unreflected and unmoderated highly enriched uranium spherical critical mass. The experiments described in this paper, although originally justified for leakage spectra measurements and to investigate the use of a multiplying booster with a linear accelerator, also can provide estimates of the unreflected and unmoderated, highly enriched uranium spherical metal critical mass.

25637 (DPW–3665) **[Mechanical problems with Dana equipment at Savannah River].** Bloomsburg, M.S. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). 31 Oct 1951. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–467). Order Number DE93011164. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum discusses various mechanical problems in connection with Dana equipment. The method of solution and disposition of the problems is also provided. (FL)

25638 (ENEA-RTI-PCM-IFEC–92-04) **Decommissioning of pilot fuel fabrication facility at Saluggia.** Guidotti, M.; Sberze, L. ENEA, Saluggia (Italy). Area Nucleare. Nov 1992. 9p. (CONF-9202136–1: Nuclear DECOM '92: decommissioning of radioactive facilities international conference, London (United Kingdom), 17-19 Feb 1992). Order Number DE93799231. Source: OSTI; NTIS (US Sales Only); INIS.

Following Italy's decision to close down the nuclear power stations existing in the country, ENEA (Italian Agency for Energy, New Technologies and the Environment) has started decommissioning its facilities relevant to the fuel cycle. The first facility to be decommissioned was the Fuel Fabrication Pilot Plant (IFEC) situated at the Saluggia Centre. The IFEC Plant comprised a store, three lines respectively for MTR CIRENE (Candu type) and enriched UO_2 fuel fabrication, and various auxiliary facilities (quality control laboratories, ventilation, etc.). Decommissioning has consisted in the transfer of all fissile material, in the decontamination to background levels of most of the equipment and of the whole building and in the dismantling of the equipment that could not be completely decontaminated. The scope of the operation was: to recover, for normal use, the building and most of the equipment of the plant; and to minimize the quantity and volume of the wastes produced. The decommissioning operations have been authorized by the competent authority, where necessary, and have been carried out mostly by the personnel that had previously operated the plant.

25639 (HW–18712) **P-10 air monitor design criteria.** Eisenacher, P.L. Hanford Works, Richland, WA (United States). 29 Aug 1950. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93017351. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This HAPO report documents the design criteria for the P-10 air monitor at the 300 Area. Minimum reliable readings and accompanying remarks document testing of four different monitors.

25640 (IAEA-TECDOC–697, pp. 82-87) **FP gas release behaviour of high burn-up MOX fuels for thermal reactors.** Kamimura, K. (Power Reactor and Nuclear Fuel Development Corp., Toakai, Ibaraki (Japan)). International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

Instrumented rig IFA-565 is now under irradiation in HBWR to investigate high burn-up MOX fuel behaviour for thermal reactors. The irradiation test of IFA-514 (former rig number for IFA-565) was performed from 1979 to 1988. The fission gas release behaviour for the MOX fuel rods of IFA-514/565 to the burn-up level of 41GWd/t MOX (47GWd/tM) has been analysed. The following observations are made: Vitanza threshold for UO_2 fuel is applicable to predict the onset of fission gas release for MOX fuel; There were no significant differences in fission gas release fraction between PNC MOX fuels and UO_2 fuels at about 47GWd/tM; Fission gas release fraction of hollow pellets might be smaller than that of solid pellets according to the In-pile data. It is necessary to confirm the result by using PIE data after the irradiation; PNC MOX fuels have achieved high burn-up as 47GWd/tM without failure. (author). 7 refs, 7 figs, 2 tabs.

25641 (LA-UR–93-1860) **Safeguards instrumentation for continuous unattended monitoring in plutonium fuel fabrication plants.** Menlove, H.O. (Los Alamos National Lab., NM (United States)); Miller, M.C.; Ohtani, T.; Seya, M.; Takahashi, S. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9309151–2: Global '93: international conference and technology exhibition, Seattle, WA (United States), 12-17 Sep 1993). Order Number DE93014480. Source: OSTI; NTIS; INIS; GPO Dep.

Nondestructive assay (NDA) systems have been developed for use in an automated mixed oxide fabrication facility. Unique features have been developed for the NDA systems to accommodate

robotic sample handling and remote operation. In addition, the systems have been designed to obtain International Atomic Energy Agency inspection data without the need for an inspector at the facility at the time of the measurements. The equipment is being designed to operate continuously in an unattended mode with data storage for periods of up to one month. The design, performance characteristics, and authentication of the NDA systems are described. The data related to reliability, precision, and accuracy are presented.

25642 (WSRC-MS–93-174) **Comparison of a constraint directed search to a genetic algorithm in a scheduling application.** Abbott, L. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9309128–1: International symposium on artificial intelligence, Monterrey (Mexico), 22-24 Sep 1993). Order Number DE93011784. Source: OSTI; NTIS; INIS; GPO Dep.

Scheduling plutonium containers for blending is a time-intensive operation. Several constraints must be taken into account; including the number of containers in a dissolver run, the size of each dissolver run, and the size and target purity of the blended mixture formed from these runs. Two types of algorithms have been used to solve this problem: a constraint directed search and a genetic algorithm. This paper discusses the implementation of these two different approaches to the problem and the strengths and weaknesses of each algorithm.

The availability of a diagnostic aid tool may prove to be extremely useful for monitoring complex processes such as those employed in nuclear fuel reprocessing plants. In the case of a malfunction, the choice of a corrective action demands the accurate knowledge of the disturbed state, because the same action applied to two distinct states of the process may have different consequences. The very high non-linearity of the responses of the process and the complexity of the mechanisms involved preclude the use of expert systems to perform the diagnosis. It was therefore decided to construct a diagnostic program based on the use of an available model allowing the dynamic simulation of the process. The program serves to identify a disturbance from its consequences, thus in some way achieving the 'inversion' of the model. The method adopted uses a regular mesh of a disturbance space and uses simulation to calculate the corresponding response space, in which a point close to the measured response is identified, thus helping to locate the disturbance. Tests on simulated and experimental data proved fairly conclusive, making it possible to consider the application of techniques used in industrial processes, despite the scale of the data processing resources required.

25644 (ETDE-IT–93-195) **Utilization of ENEA's EUREX pilot reprocessing plant for treatment and conditioning of HLLWs.** Calle, C.; Alonzo, G.; Raspollini, M.; Luce, A. ENEA, Saluggia (Italy). Area Nucleare. 1992. 8p. (CONF-920851–95: Spectrum '92: nuclear and hazardous waste management international topical meeting, Boise, ID (United States), 23-27 Aug 1992). Order Number DE93799300. Source: OSTI; NTIS (US Sales Only); INIS.

During the 1970-80's, the operation of the two ENEA (Italian Agency for Energy, New Technologies and the Environment) pilot reprocessing plants has produced 115 cubic meters of high-level liquid wastes (HLLW's) coming from MTR, CANDU and ELK River spent fuels. A selective separation process has been developed during the last 5 years to perform the chemical treatment and conditioning of that non-conventional type of HLLW. The conditioning process consists of the selective separation of the waste into two fractions, high and low radioactive; the cementation of the low level fraction using standard MOWA technology is planned, while a small size vitrification unit, based on the ceramic melter technology, is under consideration for the high active fraction. A special study (COREX Project) was done to fit the new equipment into some existing process cells of the old pilot EUREX reprocessing plant, to be decommissioned, with the scope of minimizing construction costs.

25645 (HW–65806-RD) **Radiant-heat spray-calcination process for the solid fixation of radioactive waste: Part 1, Non-radioactive pilot unit.** Allemann, R.T.; Johnson, B.M. Jr. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 14 Nov 1960. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93014662. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The fixation of radioactive waste in a stable solid media by means of calcination of these aqueous solutions has been the subject of considerable-effort throughout the U. S. Atomic Energy Commission and by atomic energy organizations in other countries. Several methods of doing this on a continuous or semi-continuous basis have been devised, and a fev have been demonstrated to be feasible for the handling of non-radioactive, or low-activity, simulated wastes. Notable among methods currently under development are: (a) batch-operated pot calcination of waste generated from reprocessing stainless steel clad fuel elements (Darex process) and Purex waste, (b) combination rotary kiln and ball mill calcination of aluminum nitrate (TBP-25 and Redox process), and (c) fluidized bed calcination of TBP-25 and Purex wastes. Although a considerable amount of engineering experience has been obtained on the calcination of dissolved salts in a fluidized bed, and the other methods have been the subjects of a great deal of study, none of them have been developed to-the extent which would rule out the desirability of further investigation of other possible methods of calcination.

25646 (INIS-mf–12758, pp. 322-330) **Thorium base fuels reprocessing at the L.P.R. (Radiochemical Processes Laboratory) experimental plant.** Almagro, J.C. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Procesos Quimicos); Dupetit, G.A.; Deandreis, R.A.; Kaufmann, F. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The availability of the LPR (Radiochemical Processes Laboratory) plant offers the possibility to demonstrate and create the necessary technological basis for thorium fuels reprocessing. To this purpose, the solvents extraction technique is used, employing TBP (at 30%) as solvent. The process is named THOREX, a one-cycle acid, which permits an adequate separation of Th^{232} and U^{233} components and fission products. For thorium oxide elements dissolution, the 'chopp-leach' process (installed at LPR) is used, employing a NO_3 H 13N, 0.05M FH and 0.1M Al $(NO_3)_3$, as solvent. To adapt the pilot plant to the flow-sheet requirements proposed, minor modifications must be carried out in the interconnection of the existing decanting mixers. The input of the plant has been calculated by Origin Code modified for irradiations in reactors of the HWR type. (Author).

25647 (INIS-mf–12758, pp. 338-344) **Capacity limits in columns pulsed with stain steel perforated plates.** Maset, E.R. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Procesos Quimicos); Acosta, E.; Di Piano, M.; Maymo, J.A. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

This paper includes part of the second stage of the pulsed columns development program, using a water-nitric acid system as

continuous phase and tri-n-butyl phosphate dissolved in kerosene at 30% v/v as disperse phase. Two kits of different geometry perforated plates (different diameter of perforation and free area percentage) were used. Due to the affinity importance of the plates' material with the continuous phase, in all the cases the continuous aqueous phase was used. The relation of flows varied, thus obtaining in each case a curve of characteristic 'flood'. The influence of the geometrical variables, the relation of flows, the medium acidity and the pulse's amplitude was applied in the capacity of the column. Besides, the dimensional correlation of Swift W.H. on the results obtained from 'flood' with both kits of plates to relate flows 1:1 and a minimum deviation was observed. (Author).

25648 (INIS-mf–12758, pp. 358-363) **Formulation development and preparation of simulated high reactivity wastes of HWR (heavy water reactors) type.** Bevilacqua, A.M. (Comision Nacional de Energia Atomica, San Carlos de Bariloche (Argentina). Centro Atomico Bariloche); Messi de Bernasconi, N.B.; Sterba, M.E. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The quantities of elements in the nitric solution of high reactivity wastes originated in the reprocessing of HWR fuels, burnup 605 G J/Kg U (7000 MW d/ton U) were calculated from the results of ORIGEN code. The contribution to the nitric solution of gaseous and volatile compounds, actinides and corrosion and decomposition products of the organic phase were determined. Reduction criteria for scarce elements and substitution criteria for unavailable elements were developed. An original feature of the simulation is the use of uranium as substitute for actinides. The simulation refers to the concentrated nitric solution, which is temporarily stored in liquid state after the reprocessing. On the basis of results, contributions and above mentioned criteria, the nitric solution was prepared with compounds selected for its solubility in 3 M NO3 H. An heterogeneous system was obtained, formed by a solution of some of the substances and a fine suspension that sediment ed. (Author).

25649 (INIS-mf–12758, pp. 364-369) **High activity wastes immobilization in sintered glasses: simulated wastes of the HWR (heavy water reactors) type in a new formulation glass.** Bevilacqua, A.M. (Comision Nacional de Energia Atomica, San Carlos de Bariloche (Argentina). Centro Atomico Bariloche); Messi de Bernasconi, N.B.; Audero, M.A. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The new formulation of boron silicate glass, of German origin, SG7, was specifically developed for high activity wastes immobilization by a sintering process. Using the pressing technique at room temperature and subsequent sintering, the sintering conditions of the pure glass and the incorporation of the 10% in weight of simulated wastes of the HWR type recently developed, have been studied. Besides, three ways of incorporation of wastes are presented: (a) incorporation of a coincidental compound obtained from chemical and thermal denitration; (b) incorporation of a calcination only obtained from thermal denitration; (c) incorporation of the nitric solution, mixing this one with the glass, and subsequent calcination. The results from the sintering studies and from the leaching assays of the MCC-1 are presented, and the microstructures observed are described. These results are compared with those previously obtained from boron silicate glasses of the VG type. Finally, results from long duration leaching assays, performed in samples obtained years before, are presented. (Author).

25650 (LA-UR–93-1843) **Safeguards Instruments for Large-Scale Reprocessing Plants.** Hakkila, E.A. (Los Alamos National Lab., NM (United States)); Case, R.S.; Sonnier, C. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Source: OSTI; NTIS; GPO Dep.

Between 1987 and 1992 a multi-national forum known as LASCAR (Large Scale Reprocessing Plant Safeguards) met to assist the IAEA in development of effective and efficient safeguards for large-scale reprocessing plants. The US provided considerable input for safeguards approaches and instrumentation. This paper reviews and updates instrumentation of importance in measuring plutonium and uranium in these facilities.

25651 (WHC-SA–1812) **Use of the USQ process with an operating SAR for the shutdown/terminal cleanout of the PUREX facility.** Dodd, E.N. Westinghouse Hanford Co., Richland, WA (United States). Jun 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9306143–12: Energy Facility Contractors Group safety analysis meeting, Denver, CO (United States), 16-18 Jun 1993). Order Number DE93016223. Source: OSTI; NTIS; INIS; GPO Dep.

The Plutonium-Uranium Extraction (PUREX) facility at the Hanford Site is a remote canyon facility that began operations in 1956 to support the Atomic Energy Commission and later the Department of Energy in the recovery of plutonium, uranium, and neptunium from spent reactor fuel. This report follows the transition of the PUREX facility from standby mode in 1990 to shutdown/terminal cleanout. Preparation of the Final Safety Analysis Report (FSAR), evaluation of OSR requirements, and the use of the USQ to successfully complete the deactivation of the facility in a timely and cost effective manner are discussed. The major activities, both administrative and procedural, performed as part of the PUREX facility deactivation are described.

This document provides the papers presented by Sandia Laboratories at PATRAM '92, the tenth International symposium on the Packaging and Transportation of Radioactive Materials held September 13–18, 1992 in Yokohama City, Japan. Individual papers have been cataloged separately.

25653 (CONF-930408–78) **The impact of using reduced capacity baskets on cask fleet size and cask fleet mix.** Joy, D.S. (Oak Ridge National Lab., TN (US)); Johnson, P.E.; Andress, D.A. Oak Ridge National Lab., TN (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International high-level radioactive waste management conference; Las Vegas, NV (United States); 25-29 Apr 1993. Order Number DE93015296. Source: OSTI; NTIS; INIS; GPO Dep.

The Civilian Radioactive Waste Management System transportation system will encounter a wide range of spent fuel characteristics. Since the Initiative I casks are being designed to transport 10-year-old fuel with a burnup of 35,000 MWd/MTU, there is a good likelihood that a number of the cask shipments will need to be derated in order to meet the Nuclear Regulatory Commission radiation guidelines. This report discusses the impact of cask derating by using reduced-capacity baskets. Cask derating, while enhancing the ability to move spent fuel with a wider range of age and burnup characteristics, increases the number of shipments; the amount of equipment (cask bodies, baskets, etc.); and the number

of visits to both shipping and receiving sites required to transport a specific amount of spent fuel.

25654 (DOE/CH/10324–T1) **Lessons learned by southern states in transportation of radioactive materials.** Southern States Energy Board, Norcross, GA (United States). Mar 1992. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016297. Source: OSTI; NTIS; INIS; GPO Dep.

This report has been prepared under a cooperative agreement with DOE's Office of Civilian Radioactive Waste Management (OCRWM) and is a summary of the lessons learned by southern states regarding the transportation of radioactive materials including High-Level Radioactive Wastes (HLRW) and Spent Nuclear Fuel (SNF). Sources used in this publication include interviews of state radiological health and public safety officials that are members of the Southern States Energy Board (SSEB) Advisory Committee on Radioactive Materials Transportation, as well as the Board's Transuranic (TRU) Waste Transportation Working Group. Other sources include letters written by the above mentioned committees concerning various aspects of DOE shipment campaigns.

25655 (DOE/CH/10324–T2) **Spent Fuel and High-Level Radioactive Waste Transportation Report.** Southern States Energy Board, Norcross, GA (United States). Mar 1992. 133p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016298. Source: OSTI; NTIS; INIS; GPO Dep.

This publication is intended to provide its readers with an introduction to the issues surrounding the subject of transportation of spent nuclear fuel and high-level radioactive waste, especially as those issues impact the southern region of the United States. It was originally issued by SSEB in July 1987 as the Spent Nuclear Fuel and High-Level Radioactive Waste Transportation Primer, a document patterned on work performed by the Western Interstate Energy Board and designed as a "comprehensive overview of the issues." This work differs from that earlier effort in that it is designed for the educated layman with little or no background in nuclear waste issues. In addition. this document is not a comprehensive examination of nuclear waste issues but should instead serve as a general introduction to the subject. Owing to changes in the nuclear waste management system, program activities by the US Department of Energy and other federal agencies and developing technologies, much of this information is dated quickly. While this report uses the most recent data available, readers should keep in mind that some of the material is subject to rapid change. SSEB plans periodic updates in the future to account for changes in the program. Replacement pages will be supplied to all parties in receipt of this publication provided they remain on the SSEB mailing list.

25656 (DOE/CH/10324–T3) **An examination of the Hazardous Materials Transportation Uniform Safety Act (HMTUSA): A southern perspective.** Southern States Energy Board, Norcross, GA (United States). Mar 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016299. Source: OSTI; NTIS; INIS; GPO Dep.

On November 16,1990, President Bush signed into law the most comprehensive amendments to the Hazardous Materials Transportation Act (HMTA) in 15 years. The Hazardous Materials Transportation Uniform Safety Act of 1990 (HMTUSA) was created by Congress in an effort to strengthen and clarify the HMTA. This paper will discuss the act's provisions as they affect shipments of spent fuel and high-level radioactive materials as well as the impact of those provisions on routing and emergency response issues in the southern region. HMTUSA consists of seven key provisions that affect radioactive materials: clarification of regulatory jurisdiction; highway routing standards; broadened industry registration; safety permits for motor carriers of high risk materials; expanded nuclear transportation requirements; new provisions for emergency response training and planning; and a public process for assessing the feasibility of a federally operated central reporting system and data center. In addition to amending various HMTA provisions, the new HMTUSA act provides appropriations to carry out the specific goals of the legislation. The act authorizes appropriations for the 1991, 1992 and 1993 fiscal years.

25657 (DOE/CH/10324–T5) **Radiological transportation emergency response training course funding and timing in the southern states.** Southern States Energy Board, Norcross, GA (United States). Oct 1991. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016301. Source: OSTI; NTIS; INIS; GPO Dep.

The following is a review of the enabling statutes of 16 southern states regarding training for personnel preparing for or responding to a transportation-related emergency involving highway route-controlled quantities of spent fuel and high-level radioactive waste. This report outlines the funding sources and procedures for administering funds for programs attended by state and local officials. Additionally, the report outlines the views of emergency response officials in the southern states concerning the timing and administration of future federal assistance to be provided under §180(c) of the Nuclear Waste Policy Amendments Act. Under §180(c) of the Nuclear Waste Policy Amendments Act of 1987, the US Department of Energy (DOE) is required to provide technical assistance and funds to states for training public safety officials of appropriate units of local government and Indian tribes when spent nuclear fuel or high-level radioactive waste is transported through their jurisdictions. The Comprehensive Cooperative Agreement (CCA) is the primary funding mechanism for federal assistance to states for the development of their overall emergency management capabilities. FEMA supports 12 separate emergency management programs including the Emergency Management Training program (EMT). This program provides funds for emergency management training and technical assistance to states for unique state training needs. Funds may be used for instructors, students and other related costs.

25658 (DOE/CH/10324–T6) **Southern States' Routing Agency Report.** Southern States Energy Board, Norcross, GA (United States). Feb 1988. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016302. Source: OSTI; NTIS; INIS; GPO Dep.

The Southern States' Routing Agency Report is a compendium of 16-southern states' routing programs and authorities for high-level radioactive materials transportation. The report includes the identification of each state's designated routing agency and state legislation and regulations pertaining specifically to the shipment routing of high-level radioactive materials. Using information collected and compiled by the Hazardous Materials Information Group at Oak Ridge National Laboratory, the report also addresses local government routing restrictions for high-level radioactive materials transportation. Whether local or state routing restrictions have been legally challenged and found to be inconsistent and preempted by the federal Hazardous Materials Transportation Act of 1974 (49 App. USC. 1801 et seq.) is noted. Finally, the state agency and contact designated by each state's governor to receive advance notification and shipment routing information under 10 Code of Federal Regulations (CFR) Parts 71 and 73 is listed.

25659 (DOE/CH/10324–T7) **Southern states radiological emergency response laws and regulations.** Southern States Energy Board, Norcross, GA (United States). Jul 1989. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016303. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to provide a summary of the emergency response laws and regulations in place in the various states within the southern region for use by legislators, emergency response planners, the general public and all persons concerned about the existing legal framework for emergency response. SSEB expects to periodically update the report as necessary. Radiation protection regulations without emergency response provisions are not included in the summary.

25660 (DOE/CH/10324–T8) **Alternative routes for highway shipments of radioactive materials and lessons learned from state designations.** Southern States Energy Board, Norcross, GA (United States). Jul 1990. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016305. Source: OSTI; NTIS; INIS; GPO Dep.

Pursuant to the Hazardous Materials Transportation Act (HMTA), the Department of Transportation (DOT) has promulgated a comprehensive set of regulations regarding the highway transportation

of high-level radioactive materials. These regulations, under docket numbers HM-164 and HM-164A, establish interstate highways as the preferred routes for the transportation of radioactive materials within and through the states. The regulations also provide a methodology by which a state may select alternative routes. First, the state must establish a "state routing agency", defined as an entity authorized to use the state legal process to impose routing requirements on carriers of radioactive material (49 CFR 171.8). Once identified, the state routing agency must select routes in accordance with DOTs Guidelines for Selecting Preferred Highway Routes for Large Quantity Shipments of Radioactive Materials or an equivalent routing analysis. Adjoining states and localities should be consulted on the impact of proposed alternative routes as a prerequisite of final route selection. Lastly, the states must provide written notice to DOT of any alternative route designation before the routes are deemed effective. The purpose of this report is to discuss the "lessons learned" by the five states within the southern region that have designated alternative or preferred routes under the regulations of the Department of Transportation (DOT) established for the transportation of radioactive materials. The document was prepared by reviewing applicable federal laws and regulations, examining state reports and documents and contacting state officials and routing agencies involved in making routing decisions. In undertaking this project, the Southern States Energy Board hopes to reveal the process used by states that have designated alternative routes and thereby share their experiences (i.e., lessons learned) with other southern states that have yet to make designations.

25661 (DOE/CH/10324–T10) **Southern routes for high-level radioactive waste: Agencies, contacts, and designations.** Southern States Energy Board, Norcross, GA (United States). May 1991. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016307. Source: OSTI; NTIS; INIS; GPO Dep.

The Southern Routes for High-Level Radioactive Waste: Agencies, Contacts and Designations is a compendium of sixteen southern states' routing programs for the transportation of high-level radioactive materials. The report identifies the state-designated routing agencies as defined under 49 Code of Federal Regulations (CFR) Part 171 and provides a reference to the source and scope of the agencies' rulemaking authority. Additionally, the state agency and contact designated by the state's governor to receive advance notification and shipment routing information under 10 CFR Parts 71 and 73 are also listed. This report also examines alternative route designations made by southern states and the lessons that were learned from the designation process.

25662 (DOE/CH/10324–T11) **Southern States' Routing Agency Report.** Southern States Energy Board, Norcross, GA (United States). Mar 1990. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016308. Source: OSTI; NTIS; INIS; GPO Dep.

The Southern States' Routing Agency Report is a compendium of 16-southern states' routing program for the transportation of high-level radioactive materials. The report identifies the state-designated routing agencies as defined under 49 Code of Federal Regulations (CFR) Part 171 and provides a reference to the source and scope of the agencies' rulemaking authority. Additionally, the state agency and contact designated by the state's governor to receive advance notification and shipment routing information under 10 CFR Parts 71 and 73 are also listed.

25663 (DOE/CH/10324–T14) **Lessons learned by southern states in designating alternative routes.** Southern States Energy Board, Norcross, GA (United States). Aug 1989. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016311. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to discuss the "lessons learned" by the five states within the southern region that have designated alternative or preferred routes under the regulations of the Department of Transportation (DOT) established for the transportation of radioactive materials. The document was prepared by reviewing applicable federal laws and regulations, examining state reports and documents and contacting state officials and routing agencies involved in making routing decisions. In undertaking this project, the Southern States Energy Board hopes to reveal the process used by states that have designated alternative routes and thereby share their experiences (i.e., lessons learned) with other southern states that have yet to make designations. Under DOT regulations (49 CFR 177.826), carriers of highway route controlled quantities of radioactive materials (which include spent nuclear fuel and high-level waste) must use preferred routes selected to reduce time in transit. Such preferred routes consist of (1) an interstate system highway with use of an interstate system bypass or beltway around cities when available, and (2) alternate routes selected by a "state routing agency."

25664 (DOE/CH/10324–T16) **Southern State Radiological Transportation Emergency Response Training Course Summary.** Southern States Energy Board, Norcross, GA (United States). Sep 1990. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016313. Source: OSTI; NTIS; INIS; GPO Dep.

The Southern States Energy Board (SSEB) is an interstate compact organization that serves 16 states and the commonwealth of Puerto Rico with information and analysis in energy and environmental matters. Nuclear waste management is a topic that has garnered considerable attention in the SSEB region in the last several years. Since 1985, SSEB has received support from the US Department of Energy for the regional analysis of high-level radioactive waste transportation issues. In the performance of its work in this area, SSEB formed the Advisory Committee on High-Level Radioactive Materials Transportation, which comprises representatives from impacted states and tribes. SSEB meets with the committee semi-annually to provide issue updates to members and to solicit their views on activities impacting their respective states. Among the waste transportation issues considered by SSEB and the committee are shipment routing, the impacts of monitored retrievable storage, state liability in the event of an accident and emergency preparedness and response. This document addresses the latter by describing the radiological emergency response training courses and programs of the southern states, as well as federal courses available outside the southern region.

25665 (DOE/CH/10324–T18) **Spent fuel and high-level radioactive waste transportation report.** Southern States Energy Board, Norcross, GA (United States). Nov 1990. 139p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016315. Source: OSTI; NTIS; INIS; GPO Dep.

This publication is intended to provide its readers with an introduction to the issues surrounding the subject of transportation of spent nuclear fuel and high-level radioactive waste, especially as those issues impact the southern region of the United States. It was originally issued by the Southern States Energy Board (SSEB) in July 1987 as the Spent Nuclear Fuel and High-Level Radioactive Waste Transportation Primer, a document patterned on work performed by the Western Interstate Energy Board and designed as a "comprehensive overview of the issues." This work differs from that earlier effort in that it is designed for the educated layman with little or no background in nuclear waste issues. In addition, this document is not a comprehensive examination of nuclear waste issues but should instead serve as a general introduction to the subject. Owing to changes in the nuclear waste management system, program activities by the US Department of Energy and other federal agencies and developing technologies, much of this information is dated quickly. While this report uses the most recent data available, readers should keep in mind that some of the material is subject to rapid change. SSEB plans periodic updates in the future to account for changes in the program. Replacement pages will be supplied to all parties in receipt of this publication provided they remain on the SSEB mailing list.

25666 (DOE/CH/10324–T20) **Rail abandonments in the South and their effect on NWPA rail shipments.** Southern States Energy Board, Norcross, GA (United States). Feb 1988. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016317. Source: OSTI; NTIS; INIS; GPO Dep.

The railroad industry will have a very critical role in the eventual shipping of commercial spent fuel and defense high-level waste as provided under the Nuclear Waste Policy Act of 1982 and the 1987 amendments. The transport of spent fuel is expected to be accomplished by rail from 19 of the South's 27 reactor sites to the proposed Yucca Mountain repository or possible monitored retrievable storage facility. The decline in total track availability, however, could significantly impact the federal government's transportation program. Particularly the situation of continuing abandonments may limit rail opportunities at numerous reactor locations. Commercial nuclear reactor sites have the unfortunate problem of not being located on Class I railroad mainline tracks. The reactor sites are generally located in areas with limited rail traffic and thus vulnerable to rail abandonment procedures. The general deregulation of the railroad industry under the Staggers Act of 1980 also assisted in making rail abandonment, through the Interstate Commerce Commission, a rather simple and quick process. The effects of deregulation, however, have provided alternatives to abandonment. In particular, the Staggers Act has led to an enormous surge in the growth of short line and regional railroads. Such railroads have been able to effectively operate rail lines which Class I railroads found unprofitable. The short lines and regionals were also encouraged to competitively negotiate contracts directly with shippers. While these railroads may help reduce the number of abandonment applications, they may also represent higher shipping costs. The South has experienced a great number of abandonments since the 1960's. Many of the abandonments have been significant in length and have affected areas near nuclear plants expected to ship by rail.

25667 (DOE/CH/10324–T21) **The rail abandonment process: A southern perspective.** Southern States Energy Board, Norcross, GA (United States). Dec 1988. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016318. Source: OSTI; NTIS; INIS; GPO Dep.

One factor in evaluating the desirability of rail transport for high-level radioactive wastes or spent fuels is the frequency, or lack thereof, with which railroad and railroad lines have been, and are, abandoned. If DOE makes a decision to use the rail option and a line is subsequently abandoned, the choice results in increased cost, time delays and possibly safety problems: Information is therefore needed prior to the decision-making process to evaluate the desirability of the rail shipping option. One result of the abandonments mentioned herein, as well as other later abandonments, is the creation of a US rail system undergoing an evolutionary process in the 1980s as far-reaching as the changes that occurred when the industry was in its infancy a century and-a-half ago. The purpose of this paper is to examine the factors leading to some of these changes by tracing the historical development of the rail abandonment process, with particular emphasis on the rise of regional railroads, their problems in the modern era and current trends in rail abandonments as well as their effects on the southeastern United States.

25668 (DOE/CH/10324–T22) **Spent fuel and high-level radioactive waste transportation report.** Southern States Energy Board, Norcross, GA (United States). Nov 1989. 137p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016319. Source: OSTI; NTIS; INIS; GPO Dep.

This publication is intended to provide its readers with an introduction to the issues surrounding the subject of transportation of spent nuclear fuel and high-level radioactive waste, especially as those issues impact the southern region of the United States. It was originally issued by the Southern States Energy Board (SSEB) in July 1987 as the Spent Nuclear Fuel and High-Level Radioactive Waste Transportation Primer, a document patterned on work performed by the Western Interstate Energy Board and designed as a "comprehensive overview of the issues." This work differs from that earlier effort in that it is designed for the educated layman with little or no background in nuclear waste issues. In addition, this document is not a comprehensive examination of nuclear waste issues but should instead serve as a general introduction to the subject. Owing to changes in the nuclear waste management system, program activities by the US Department of Energy and other federal agencies and developing technologies, much of this information is dated quickly. While this report uses the most recent data available, readers should keep in mind that some of the material is subject to rapid change. SSEB plans periodic updates in the future to account for changes in the program. Replacement pages sew be supplied to all parties in receipt of this publication provided they remain on the SSEB mailing list.

25669 (DOE/CH/10324–T23) **Report on state liability for radioactive materials transportation incidents: A survey of laws.** Southern States Energy Board, Norcross, GA (United States). Oct 1989. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016320. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to provide a synopsis of the liability laws of the Southern States Energy Board's (SSEB's) 16 member states. It begins by briefly reviewing potential sources of liability, immunity from liability, waiver of immunity, and statutes of limitation, followed by liability laws of member states. The report was prepared by reviewing legal literature pertaining to governmental liability, with particular emphasis on nuclear waste transportation, including law review articles, legal treatises, technical reports, state statutes and regulations.

25670 (DOE/CH/10324–T24) **Southern states' routing agency report.** Southern States Energy Board, Norcross, GA (United States). Feb 1989. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016321. Source: OSTI; NTIS; INIS; GPO Dep.

The Southern states' routing agency report is a compendium of 16-southern states' routing programs relative to the transportation of high-level radioactive materials. The report identifies the state-designated routing agencies as defined under 49 Code of Federal Regulations (CFR) Part 171 and provides a reference to the source ad scope of the agencies' rulemaking authority. Additionally, the state agency and contact designated by the state's governor to receive advance notification and shipment routing information under 10 CFR Parts 71 and 73 are also listed.

25671 (DOE/CH/10324–T25) **Transportation infrastructure upgrades in the South: A compilation of state plans for construction near nuclear reactor sites.** Southern States Energy Board, Norcross, GA (United States). Mar 1992. 137p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016287. Source: OSTI; NTIS; INIS; GPO Dep.

There are currently 27 nuclear reactor sites located in the southern region. In many instances, the most practicable modes of transportation of spent nuclear fuel from these sites we through the use of highway and rail systems. These two transportation modes have important differences that affect their applicability; chief among these, perhaps, is the fact that while highway systems are publicly owned and maintained rail lines are owned by private entities. For this reason, track condition and maintenance, usage rates and other aspects of rail transport can vary widely. This report reviews southern state, department plans for infrastructure upgrades in the vicinity of nuclear reactor sites. This report includes a summary of planned modifications to bridges, access highways, and rail spurs (where applicable) over the next five years. The information contained herein was gathered from interviews with officials within state departments of transportation. With few exceptions, the contact person was an official within the departmental planning division.

25672 (INIS-GB–489) **Statement of nuclear incidents (4th Qtr. 1990): Sellafield Nuclear Processing Plant, Cumbria (BNFL); Dounreay Nuclear Power Development Establishment (UKAEA); Winfrith Atomic Energy Establishment (UKAEA).** Health and Safety Executive, London (United Kingdom). Apr 1991. [5p.] Order Number DE93631012. Source: OSTI; NTIS (US Sales Only); INIS.

Three incidents were reported in the fourth quarter of 1990. The first concerned the contamination of worker when loading used equipment prior to its decontamination. This resulted in his total

yearly radiation dose being in excess of the annual dose limits. At the UKAEA Dounreay site a small quantity of radioactive liquid leaked from a drum onto a road during the transfer of low level radioactive waste. The road surface was removed and disposed of. Two operators at the UKAEA Winfrith site were contaminated whilst operating equipment to compact radioactive waste in drums. The doses to the workers were in excess of the statutory dose limits. Investigations into all the incidents resulted in steps to improve safety. (UK).

25673 (INIS-mf–12758, pp. 504-508) **Hydraulic breakage of tanks for the transport of uranium hexafluoride (UF_6).** Biaggio, A.L. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Seguridad Radiologica y Nuclear); Lee Gonzales, H.M.; Lopez Vietri, J.R.; Novo, R.G. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

To begin with, the tank models that are proposed by the international norms for the transport and storage of hexafluoride of uranium (UF_6) are briefly described. The operations related to the transport in its different forms are also described, particularly those that can produce the hydraulic breakage of tanks during its course or in later stages, when incorrectly performed. With reference to those operations, the most important physicochemical properties of UF_6 as for safety are analyzed. A quantitative evaluation of the deviations of parameters that are controlled during the heating of tanks, comparing them with the normative nominal values, is performed. Adopting some simplifying hypothesis, a general study, applicable to all tank models proposed by norms, is carried out to determine the temperature at which the hydraulic breakage takes place when they are heated in closed-valve conditions. A curve is obtained by plotting the hydraulic breakage temperature against the filling degree. To conclude, the values obtained are compared with the results of other theoretical studies on this subject. (Author).

25674 (SAND–92-2237C) **Inelastic analysis acceptance criteria for radioactive material transportation containers.** Ammerman, D.J.; Ludwigsen, J.S. Sandia National Labs., Albuquerque, NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930702–28: Pressure vessels and piping conference, Denver, CO (United States), 25-29 Jul 1993). Order Number DE93015021. Source: OSTI; NTIS; INIS; GPO Dep.

The design criteria currently used in the design of radioactive material (RAM) transportation containers are taken from the ASME Boiler and Pressure Vessel Code (ASME, 1992). These load-based criteria are ideally suited for pressure vessels where the loading is quasistatic and all stresses are in equilibrium with externally applied loads. For impact events, the use of load-based criteria is less supportable. Impact events tend to be energy controlled, and thus, energy-based acceptance criteria would appear to be more appropriate. Determination of an ideal design criteria depends on what behavior is desired. Currently there is not a design criteria for inelastic analysis for RAM nation packages that is accepted by the regulatory agencies. This lack of acceptance criteria is one of the major factors in limiting the use of inelastic analysis. In this paper inelastic analysis acceptance criteria based on stress and strain-energy density will be compared for two stainless steel test units subjected to impacts onto an unyielding target. Two different material models are considered for the inelastic analysis, a bilinear fit of the stress-strain curve and a power law hardening model that very closely follows the stress-strain curve. It is the purpose of this paper to stimulate discussion and research into the area of strain-energy density based inelastic analysis acceptance criteria.

25675 (UCRL-JC–110276) **System response of a DOE Defense Program package in a transportation accident environment.** Chen, T.F.; Hovingh, J.; Kimura, C.Y. Lawrence Livermore National Lab., CA (United States). 15 Oct 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9301102–6: American Nuclear Society (ANS) meeting, Clearwater, FL (United States), 27 Jan 1993). Order Number DE93013852. Source: OSTI; NTIS; INIS; GPO Dep.

The system response in a transportation accident environment is an element to be considered in an overall Transportation System Risk Assessment (TSRA) framework. The system response analysis uses the accident conditions and the subsequent accident progression analysis to develop the accident source term, which in turn, is used in the consequence analysis. This paper proposes a methodology for the preparation of the system response aspect of the TSRA.

25676 (WHC-SA–1772) **Low specific activity and surface-contaminated objects determinations key to managing low-level wastes.** McCall, D.L. Westinghouse Hanford Co., Richland, WA (United States). Jan 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930205–61: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93011275. Source: OSTI; NTIS; INIS; GPO Dep.

Today's nuclear industry should be concerned that some waste shippers are improperly classifying low-level waste as low specific activity radioactive material for packaging and transportation to waste disposal facilities. If low-level waste is improperly classified, wrong packaging systems may be used, communication standards may not be met, and safety problems may be created. This paper discusses US Department of Transportation (DOT) criteria used for classifying LLW as LSA materials or as SCOS. Waste management procedures to ensure that nuclear facilities use defining criteria correctly when preparing waste for shipment and disposal also are discussed.

25677 (NUREG–1307-Rev.3) **Report on waste burial charges: Escalation of decommissioning waste disposal costs at low-level waste burial facilities: Revision 3.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications. May 1993. 45p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

One of the requirements placed upon nuclear power reactor licensees by the US Nuclear Regulatory Commission (NRC) is for the licensees to periodically adjust the estimate of the cost of decommissioning their plants, in dollars of the current year, as part of the process to provide reasonable assurance that adequate funds for decommissioning will be available when needed. This report, which is scheduled to be revised periodically, contains the development of a formula for escalating decommissioning cost estimates that is acceptable to the NRC. The sources of information to be used in the escalation formula are identified, and the values developed for the escalation of radioactive waste burial costs, by site and by year, are given. The licensees may use the formula, the coefficients, and the burial escalation factors from this report in their escalation analyses, or they may use an escalation rate at least equal to the escalation approach presented herein. This third revision of NUREG-1307 contains revised spreadsheet results for the disposal costs for the reference PWR and the reference BWR and the ratios of disposal costs at the Washington, Nevada, and South Carolina sites for the years 1986, 1988 and 1991, superseding the values given in the July 1991 issue of this report. Burial cost surcharges mandated by the Low-Level Radioactive Waste Policy Amendments Act of 1985 (LLRWPAA) have been incorporated into the revised ratio tables for those years. In addition, spreadsheet results for the disposal costs for the reference reactors and ratios of disposal costs at the two remaining burial sites in Washington and South Carolina for the year 1993 are provided. These latter results do not include any LLRWPAA surcharges, since those provisions of the Act expired at the end of 1992.

25678 (ANL/CHM/CP–75735) **Combined TRU-Sr extraction/recovery process.** Horwitz, E.P. (Argonne National Lab., IL (United States)); Dietz, M.L.; Diamond, H.; Leonard, R.A.; Rogers, R.D. Argonne National Lab., IL (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930945–4: International solvent extraction conference (ISEC '93), York (United Kingdom), 9-15 Sep 1993). Order Number DE93003979. Source: OSTI; NTIS; GPO Dep.

The combined TRU-SR extraction/recovery process is a new solvent extraction process that is designed to extract uranium, neptunium, plutonium, americium, strontium, and technetium from dissolved sludge obtained from Hanford waste storage tanks. The process utilizes a solvent formulation consisting of 0.2 M octyl(phenyl)-N,N-diisobutyl-carbainoylmethylphosphine oxide (CMPO), 0.2 M 4,4 inches (5 inches)-di-t-butylcyclohexanol8-crown-6 (DtBuCH18C6),-and 1.2 M diamyl amylphosphonate (DA[AP]) in an isoparaffinic hydrocarbon diluent. Distribution ratios of Am, Sr, and T_c(the least extractable constituents) from synthetic waste containing 3 M $HN0_3$ are 40, 8, and 3, respectively. Selective backextraction of Np, Pu, Am, and Sr from U and $T_c$is achieved using a new carboxylic acid reagent. Uranium and technetium backextraction is achieved with 0.25 M Na_2CO_3. A flowsheet has been designed for testing the combined process in high speed centrifugal contactors. Synthetic dissolved sludge waste spiked with U, TRUs, ^{85}Sr and $^{99m}T_c$will be used as the feed. A sufficient number of stages are utilized to remove > 99.99% of the TRUs and Sr and > 90% of the T_c.

25679 (ANL/CMT/CP–78025) **A literature review of surface alteration layer effects on waste glass behavior.** Feng, X.; Cunnane, J.C.; Bates, J.K. Argonne National Lab., IL (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930438–10: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93012898. Source: OSTI; NTIS; INIS; GPO Dep.

When in contact with an aqueous solution, nuclear waste glass is subject to a chemical attack that results in progressive alteration. During tills alteration, constituent elements of the glass pass into the solution; elements initially in solution diffuse into, or are adsorbed onto, the solid; and new phases appear. This results in the formation of surface layers on the reacted glass. The glass corrosion and radionuclide release can be better understood by investigating these surface layer effects. In the past decade, there have been numerous studies regarding the effects of surface layers on glass reactions. This paper presents a systematic analysis and summary of the past knowledge regarding the effects of surface layers on glass-water interaction. This paper describes the major formation mechanisms of surface layers; reviews the role of surface layers in controlling mass transport and glass reaction affinity (through crystalline phases, an amorphous silica, a gel layer, or all the components in the glass); and discusses how the surface layers contribute to the retention of radionuclides during glass dissolution.

25680 (ANL/EAIS/CP–78643) **Trying to make an unwanted facility palatable.** Metz, W.C. Argonne National Lab., IL (United States). Environmental Assessment and Information Sciences Div. [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930408–57: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93009952. Source: OSTI; NTIS; INIS; GPO Dep.

Finding suitable accommodations for the temporary storage and permanent disposal of this: nation's low- and high-level radioactive waste is proving an ever more difficult task in this era of volatile technology and science debate over the merits of the nuclear fuel cycle. Local constituencies become deeply immersed in the complex debate whether the site is chosen through a technical site selection process or is a voluntary entry. Rural communities with candidate sites need to initially shift their focus away from this, often acrimonious, debate; instead, the first discussion priority for such rural communities should be to develop a dynamic vision of their own economic and environmental future. The second discussion priority should be to determine if the array of accompanying incentives and benefits hosting this facility would afford the community the opportunity for vision fulfillment. If so, total focus should, then, be given to understanding and resolving to the satisfaction of the constituents issues related to nuclear technology, isolation of radioactive materials, management of risk, storage and disposal facility need, perceived and actual risk, oversight and power sharing authority, engineered safety barriers, and public trust.

25681 (BNL–48991) **Bioremediation of soils, sludges, and materials contaminated with toxic metals or radionuclides.** Francis, A.J. Brookhaven National Lab., Upton, NY (United States). Apr 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930475–1: Innovative concepts technology fair, Austin, TX (United States), 22-23 Apr 1993). Order Number DE93014287. Source: OSTI; NTIS; GPO Dep.

Bioremediation stabilizes and reclaims radionuclide or toxic metal-contaminated materials, soils, sediments, or wastes; it then recovers the contaminating radionuclides and metals. Waste materials are stabilized and reduced in volume using anaerobic bacteria; or alternatively, materials are treated with citric acid before bioremediation begins. Photolysis is used after bioremediation to release radionuclides.

25682 (CONF-920866–7) **Current plans to characterize the design basis ground motion at the Yucca Mountain, Nevada Site.** Simecka, W.B. (USDOE Nevada Field Office, Las Vegas, NV (United States)); Grant, T.A.; Voegele, M.D.; Cline, K.M. Science Applications International Corp., Las Vegas, NV (United States); American Society of Civil Engineers, New York, NY (United States). 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-87NV10576. From American Society of Civil Engineers (ASCE) symposium on dynamic analysis and design considerations, for high-level nuclear waste repositories; San Francisco, CA (United States); 19-20 Aug 1992. Order Number DE93013508. Source: OSTI; NTIS; INIS; GPO Dep.

A site at Yucca Mountain Nevada is currently being studied to assess its suitability as a potential host site for the nation's first commercial high level waste repository. The DOE has proposed a new methodology for determining design-basis ground motions that uses both deterministic and probabilistic methods. The role of the deterministic approach is primary. It provides the level of detail needed by design engineers in the characterization of ground motions. The probabilistic approach provides a logical structured procedure for integrating the range of possible earthquakes that contribute to the ground motion hazard at the site. In addition, probabilistic methods will be used as needed to provide input for the assessment of long-term repository performance. This paper discusses the local tectonic environment, potential seismic sources and their associated displacements and ground motions. It also discusses the approach to assessing the design basis earthquake for the surface and underground facilities, as well as selected examples of the use of this type of information in design activities.

25683 (CONF-930906–3) **Treatment of waste by the Molten Salt Oxidation process at the Oak Ridge National Laboratory.** Crosley, S.M. (Oak Ridge National Lab., TN (United States)); Lorenzo, D.K.; Van Cleve, J.E.; Gay, R.L.; Barclay, K.M.; Newcomb, J.C.; Yosim, S.J. Oak Ridge National Lab., TN (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From '93 international conference on nuclear waste management and environmental remediation; Prague (Czech Republic); 5-11 Sep 1993. Order Number DE93007856. Source: OSTI; NTIS; INIS; GPO Dep.

The Molten Salt Oxidation (MSO) process has been under development by the Energy Technology Engineering Center (ETEC) to treat hazardous, radioactive, and mixed waste. Testing of the system was done on a number of wastes to demonstrate the technical

feasibility of the process. This testing included simulated intermediate level waste (ILW) from the Oak Ridge National Laboratory. The intermediate level waste stream consisted of a slurry of concentrated aqueous solutions of sodium hydroxide and sodium nitrate, with a small amount of miscellaneous combustible components (PVC, TBP, kerosene, and ion exchange resins). The purpose of these tests was to evaluate the destruction of the organics, evaporation of the water, and conversion of the hazardous salts (hydroxide and nitrate) to non-hazardous sodium carbonate. Results of the tests are discussed and analyzed, and the possibilities of applying the MSO process to different waste streams at ORNL in the future are explored.

25684 (DOE–93013923) **Status report on roadmap headquarters issue resolution activities.** USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). 7 Apr 1993. 120p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93013923. Source: OSTI; NTIS; INIS; GPO Dep.

The Roadmap Project Office (RPO), under the Office of Planning (EM-14), continues to review headquarters (HQ) issues raised by the field in their roadmap documents. Currently, twenty-nine HQ issues are in the "resolution" process or are being defined for resolution. The resolution process involves an Environmental Restoration and Waste Management Program (EM) HQ person, the Action Officer (AO), as the leader in the resolution process. The RPO is responsible to EM-14 for reporting on the progress of issue resolution activities and also to provide contractor support to each Action Officer: the contractor support person is identifies as the Issue Resolution Facilitator (IF). Field contacts also are identified for each issue. This document provides current information on HQ issues actively in the "resolution" process or being defined for resolution. The issues are primarily institutional rather than technical and mainly involve regulatory, coordination, prioritization, policy and management concerns.

25685 (DOE/DP/00789–T272) **Test plan: Heated axisymmetric pillar.** Torres, T.M. Sandia National Labs., Albuquerque, NM (United States). Jun 1983. 266p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012203. Source: OSTI; NTIS; GPO Dep.

The Heated Axisymmetric Pillar in situ test in room H is an intermediate step in validating numerical techniques for design and performance calculations for radioactive-waste repositories. Because the completely isolated cylindrically shaped pillar is centrally located in an annular drift and is two-dimensional or axisymmetric, numerical calculations to predict the pillar response can nearly duplicate the configuration. The axisymmetric approximation applies to both structural and thermal fields. Consequently, to a first approximation the adequacy of the constitutive model at elevated temperature for a large 10,180-ft ^{3} (950-m^3) in situ rock mass is being primarily explored in the test. Satisfactory agreement between measured and predicted response will aid in the confirmation that laboratory-generated constitutive parameters and models can be applied to large rock masses. The macrostratigraphy of clay seams, disseminated clay, anhydrite layers, and polyhalite contents, if any, will be well known because the entire pillar surface is exposed before the test. The surface of the pillar will be heated by an insulated blanket heater so as to increase its mean temperature by about 40°C in 3 years. Instruments will be installed to measure vertical and horizontal drift closures, deformations of the salt within the pillar and around the drift up to a distance of 50 ft (15.240 m) into the salt, and stresses (pressures) in the salt in the pillar and around the drift up to 50 ft (15.240 m) into the salt. Thermocouples will be installed to measure temperatures of the salt around the drift and pillar. Deformation and fracture of the pillar will be monitored by acoustic-emission triangulation. Also, fracture will be monitored by visual observations of the pillar surface at designated locations. Measurements will continue for at least 3 years.

25686 (DOE/DP/00789–T277) **Experimental plan for tracer testing in the Culebra Dolomite at the WIPP site: Revision A.** Beauheim, R.L.; Davies, P.B. Sandia National Labs., Albuquerque, NM (United States). 15 Oct 1992. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012208. Source: OSTI; NTIS; INIS; GPO Dep.

This Experimental Plan provides a conceptual description of a proposed series of tracer tests to be conducted in the Culebra Dolomite Member of the Rustler Formation at the WIPP site. The new tracer tests are intended to address deficiencies that have been identified both in the performance and interpretation of previously conducted tracer tests' Tracer tests were conducted at the H-2 hydropad in 1980, at the H-6 hydropad in 1981, 1982, and 1983, at the H-4 hydropad from 1982 to 1984, at the H-3 hydropad in 1984, and at the H-11 hydropad in 1988. These tests were all performed over the entire 7-m thickness of the Culebra and, therefore, provided no information on the effects of vertical heterogeneity within the Culebra on transport. In addition, each of the previous tracer tests provided data only from 1 to 3 flow paths, allowing calibration of interpretive models but not validation of those models. The tracer tests at the H-3, H-6, and H-11 hydropads have been interpreted using a double-porosity continuum model (SWIFT 11) in which advective transport occurs through a uniform network of fractures while diffusion of tracer from the fractures to the porosity in the rock matrix causes a physical retardation of the transport. External reviewers, particularly participants in the international INTRAVAL program, have suggested that alternative mechanisms, such as fracture channeling, could explain the observed physical retardation and have recommended that additional tracer tests be designed and performed to distinguish among these mechanisms. The previous tracer tests also provided no information on chemical-retardation processes within the Culebra, which have been shown through performance-assessment calculations to have a large impact on cumulative releases of radionuclides from the WIPP to the accessible environment.

25687 (DOE/EM–0089T-Rev.1) **DOE methods for evaluating environmental and waste management samples: Revision 1.** Goheen, S.C. (Pacific Northwest Lab., Richland, WA (United States)); McCulloch, M.; Thomas, B.L.; Riley, R.G.; Sklarew, D.S.; Mong, G.M.; Fadeff, S.K. (eds.). USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States); Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 176p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PNL–7722). Order Number DE93014591. Source: OSTI; NTIS; INIS; GPO Dep.

DOE Methods for Evaluating Environmental and Waste Management Samples (DOE Methods) provides applicable methods in use by. the US Department of Energy (DOE) laboratories for sampling and analyzing constituents of waste and environmental samples. The development of DOE Methods is supported by the Laboratory Management Division (LMD) of the DOE. This document contains chapters and methods that are proposed for use in evaluating components of DOE environmental and waste management samples. DOE Methods is a resource intended to support sampling and analytical activities that will aid in defining the type and breadth of contamination and thus determine the extent of environmental restoration or waste management actions needed, as defined by the DOE, the US Environmental Protection Agency (EPA), or others.

25688 (DOE/FTR–93012976) **Travel to the Envirotech Vienna 1992 conference in Vienna, Austria to obtain current information related to waste management activities and technologies: Foreign trip report, April 21–24, 1992.** Motes, B.G. EG and G Idaho, Inc., Idaho Falls, ID (United States). 22 Jun 1992. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93012976. Source: OSTI; NTIS (US Sales Only); GPO Dep.

During the conference, approximately 80 papers were presented in 12 technical sessions and one poster paper session. The papers were divided into the following subject areas: Waste minimization and avoidance; circular recycling processes; assessment, development and waste management perspectives; development and reduction of packaging; industrial wastes treatment; legislation and guidelines; detection, test methods, monitoring, and assessment of contaminated sites; site remediation; leachates; bioremediation of soils; surface and groundwater purification; and wastewater treatment. The comprehensive section of the report summarizes selected papers grouped by country. The titles of other papers

presented are also provided by country. In addition, pertinent discussions with attendees are incorporated. In summary, the US is the world leader in waste management, including overall technology. A number of other more industrialized countries have established waste management programs and are aggressively addressing their waste management problems. The former soviet block countries are only initiating their waste management programs and are seeking foreign support and technology. A number of foreign countries have or are developing innovative technologies potentially applicable to site remediation in the US.

25689 (DOE/FTR–93013123) **Travel to Bristol, England to observe "proof-of-principle" experiments for nitric acid recycle and nitrate destruction, review progress on contracted work, and the project schedule status: Foreign trip report, July 25–30, 1992.** Lehmkuhl, G.D. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. 28 Aug 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. Order Number DE93013123. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The proof-of-principle experiments for nitric acid recycle and nitrate destruction were successfully run at the Bradtec Limited laboratory in Bristol, England. A spike of plutonium plus americium was added to the feed stream to trace actinide movement-and distribution. While experimental results are not complete at this time, it has been shown that the Bradtec processes are definitely applicable to processing of wastes at Rocky Flats plant and other DOE sites. The Bradtec processes are, however, presently far from being ready for production use. It is recommended that further development be undertaken to tailor the processes for specific waste streams at DOE sites and to scale up the equipment for production uses. Bradtec has committed to submitting their final report draft to Rocky Flats by September 18, 1992. Rocky Flats review comments will be sent to Bradtec for consideration prior to issuing the final version of the report. The delay of the final report beyond the originally scheduled date (18 August 1992) is due to a temporary shut down of the Bradtec experimental laboratory for ventillation system duct remediation. This will cause a delay in chemical analyses of experimental solutions.

25690 (DOE-HMIP-RR–92.111) **The Nirex Sellafield site investigation: the role of geophysical interpretation.** Muir Wood, R.; Woo, G.; MacMillan, G. BEQE Ltd., Warrington (United Kingdom). 1992. [121p.] Sponsored by Department of the Environment, London (United Kingdom). Her Majesty's Inspectorate of Pollution. Contract PECD-7/9/620;55-01-R-01. Order Number DE93631586. Source: OSTI; NTIS (US Sales Only); INIS.

This report reviews the methods by which geophysical data are interpreted, and used to characterize the 3-D geology of a site for potential storage of radioactive waste. The report focuses on the NIREX site investigation at Sellafield, for which geophysical observations provide a significant component of the structural geological understanding. In outlining the basic technical principles of seismic data processing and interpretation, and borehole logging, an attempt has been made to identify errors, uncertainties, and the implicit use of expert judgement. To enhance the reliability of a radiological probabilistic risk assessment, recommendations are proposed for independent use of the primary NIREX geophysical site investigation data in characterizing the site geology. These recommendations include quantitative procedures for undertaking an uncertainty audit using a combination of statistical analysis and expert judgement. (author).

25691 (DOE/LLW–165) **Low-level radioactive waste disposal facility fee schedules.** Smith, P. EG and G Idaho, Inc., Idaho Falls, ID (United States); Rogers and Associates Engineering Corp., Salt Lake City, UT (United States). Apr 1993. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93013744. Source: OSTI; NTIS; INIS; GPO Dep.

In the 1990's and beyond, new low-level radioactive waste (LLW) disposal facilities will be developed by States and compact regions. These disposal facilities will differ significantly from the existing facilities in a number of ways. One of these ways may be the fee schedule used to determine how much is charged each of the LLW generators to dispose of its wastes. This report reviews the general concept of fee schedules. There are an infinite number of combinations of the potential elements for a fee schedule, but the report focuses on four kinds of schedules: volume-based schedules, activity-based schedules, annual use fees, and cost allocation schedules. The choice of which elements to use and the structure of the schedule will be determined by the facility operator or its regulatory authority. This document is intended to assist them in understanding the choices available and the potential impacts of the schedule that they select.

25692 (DOE/METC/C–93/7063) **Innovative technologies for recycling and reusing radioactively contaminated materials from DOE facilities.** Bossart, S.J. (USDOE Morgantown Energy Technology Center, WV (United States)); Hyde, J. USDOE Morgantown Energy Technology Center, WV (United States). [1993]. 16p. Sponsored by USDOE, Washington, DC (United States). (CONF-930523–8: 18. National Association of Environmental Professionals (NAEP) annual conference on current and future priorities for environmental management, Raleigh, NC (United States), 24-26 May 1993). Order Number DE93015579. Source: OSTI; NTIS; INIS; GPO Dep.

Through award of ten contracts under the solicitation, DOE is continuing efforts to develop innovative technologies for decontamination and recycling or reusing of process equipment, scrap metal, and concrete. These ten technologies are describe briefly in this report. There is great economic incentive for recycling or reusing materials generated during D&D of DOE's facilities. If successfully developed, these superior technologies will enable DOE to clean its facilities by 2019. These technologies will also generate a reusable or recyclable product, while achieving D&D in less time at lower cost with reduced health and safety risks to the workers, the public and the environment.

25693 (DOE/NBM–1100-Vol.5) **US Department of Energy interim mixed waste inventory report: Waste streams, treatment capacities and technologies: Volume 5, Site specific-Tennessee through Washington.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States); Sandia National Labs., Albuquerque, NM (United States); Brookhaven National Lab., Upton, NY (United States); EG and G Idaho, Inc., Idaho Falls, ID (United States). Apr 1993. 752p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789 ;AC06-76RL01830 ;AC07-76ID01570. Contract AF-6871. Order Number DE93012100. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) has prepared this report to provide an inventory of its mixed wastes and treatment capacities and technologies in response to Section 105(a) of the Federal Facility Compliance Act (FFCAct) of 1992 (pub. L. No. 102-386). As required by the FFCAct-1992, this report provides site-specific information on DOE's mixed waste streams and a general review of available and planned treatment facilities for mixed wastes for the following sites: ORNL; Y-12 Plant; K-25 Plant; Pantex Plant; Norfolk Naval Shipyard; Hanford Site; and Puget Sound Naval Shipyard.

25694 (DOE/NV/10872–T57) **Heat pipe effect in porous medium.** Joseph, M. Nevada Univ., Las Vegas, NV (United States). Dept. of Civil and Environmental Engineering. Dec 1992. 97p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC08-90NV10872. Order Number DE93014243. Source: OSTI; NTIS; INIS; GPO Dep.

In this thesis a parametric study of the thermal and hydrologic characteristics of the fractured porous tuffs at Yucca Mountain, Nevada was conducted. The effects of different fracture and matrix properties including permeability, thermal conductivity, specific heat, porosity, and tortuosity on heat pipe performance in the vicinity of the waste package were observed. Computer simulations were carried out using TOUGH code on a Cray YMP-2 supercomputer. None of the fracture parameters affected the heat pipe performance except the mobility of the liquid in the fracture. Matrix permeability and thermal conductivity were found to have significant effect on the heat pipe performance. The effect of mass injection was studied for liquid water and air injected at the fracture boundary. A high rate of mass injection was required to produce any

effect on the heat pipe. The fracture-matrix equilibrium is influenced by the matrix permeability and the matrix thermal conductivity.

25695 (DOE/OR–01-1100-D2) **RCRA closure plan for the Bear Creek Burial Grounds B Area and Walk- In Pits at the Oak Ridge Y-12 Plant, Oak Ridge, Tennessee.** Oak Ridge Y-12 Plant, TN (United States). Jan 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (Y/ER–53-D2). Order Number DE93013201. Source: OSTI; NTIS; INIS; GPO Dep.

In June 1987, the RCRA Closure/Postclosure Plan for the Bear Creek Burial Grounds (BCBG) was submitted to the Tennessee Department of Environment and Conservation (TDEC) for review and approval. TDEC modified and issued the plan approved on September 30, 1987. Subsequently, this plan was modified again and approved as Y/TS-395, Revised RCRA Closure Plan for the Bear Creek Burial Grounds (February 29, 1988). Y/TS-395 was initially intended to apply to A Area, C-West, B Area, and the Walk-In Pits of BCBG. However, a concept was developed to include the B Area (non-RCRA regulated) in the Walk-In Pits so that both areas would be closed under one cap. This approach included a tremendous amount of site preparation with an underlying stabilization base of 16 ft of sand for blast protection. The plan was presented to the state of Tennessee on March 8, 1990, and the Department of Energy was requested to review other unique alternatives to close the site. This amended closure plan goes further to include inspection and maintenance criteria along with other details.

25696 (DOE/OR–1054-D2) **Phase 2 Sampling Plan for Chestnut Ridge Operable Unit 2 (Filled Coal Ash Pond/Upper McCoy Branch) at the Oak Ridge Y-12 Plant, Oak Ridge, Tennessee: Environment Restoration Program.** Oak Ridge Y-12 Plant, TN (United States); CDM Federal Programs Corp., Oak Ridge, TN (United States). Jan 1993. 268p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. (Y/ER–42-D2). Order Number DE93013202. Source: OSTI; NTIS; INIS; GPO Dep.

CDM Federal Programs Corporation (CDM Federal) was contracted by Energy Systems to prepare a Phase II Sampling Plan to describe the field investigation work necessary to address regulatory agency review comments on the Remedial Investigation of the Filled Coal Ash Pond (FCAP)/Upper McCoy Branch, Chestnut Ridge Operable Unit 2 at the Y-12 Plant, conducted by CH2M Hill in 1990. The scope and approach of the field investigation described in this plan specifically focus on deficiencies noted by the regulators in discussions at the comment resolution meeting of May 8, 1992, in Oak Ridge, Tennessee. This Phase II Sampling Plan includes a field sampling plan, a field and laboratory quality assurance project plan, a health and safety plan, a waste management plan, and appendixes providing an update to the applicable or relevant and appropriate requirements for this site and field and laboratory testing methods and procedures.

25697 (DOE/RW/00134–T2) **Yucca Mountain Site Characterization Project Technical Data Catalog.** USDOE Yucca Mountain Site Characterization Project Office, Las Vegas, NV (United States). 31 Dec 1992. 246p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-91RW00134. Order Number DE93014510. Source: OSTI; NTIS; INIS; GPO Dep.

The June 1, 1985, Department of Energy (DOE)/Nuclear, Regulatory Commission (NRC) Site-Specific Procedural Agreement for Geologic Repository Site Investigation and Characterization Program requires the DOE to develop and maintain a catalog of data which will be updated and provided to the NRC at least quarterly. This catalog is to include a description of the data; the time (date), place, and method of acquisition; and where it may be examined. The Yucca Mountain Site Characterization Project (YMP) Technical Data Catalog is published and distributed in accordance with the requirements of the Site-Specific Agreement. The YMP Technical Data Catalog is a report based on reference information contained in the YMP Automated Technical Data Tracking System (ATDT). The reference information is provided by Participants for data acquired or developed in support of the YMP. The Technical Data Catalog is updated quarterly and published in the month following the end of each quarter. Each new publication of the Technical Data Catalog supersedes the previous edition.

25698 (DOE/RW/00134–T4) **A comparative application of the Repository Integration Program (RIP) to Total System Performance Assessment, 1991.** INTERA, Inc., Las Vegas, NV (United States). 16 Jul 1993. 276p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-91RW00134. Order Number DE93017134. Source: OSTI; NTIS; INIS; GPO Dep.

During Fiscal Year (FY) 1991 and FY 1992, Sandia National Laboratory and Battelle Pacific Northwest Laboratory were assigned the responsibility to generate initial Total System Performance Assessments (TSPAs) of the Yucca Mountain site. The analyses performed by these organizations (called TSPA-1991) are reported in Barnard et al(1992) and Eslinger et al. (1993). During this same time period, Golder Associates Inc. was assigned the task of generating a model capable of analyzing the total system performance of a high-level radioactive waste repository. The developed model, called Repository Integration Program (RIP), is documented in Kossik and Hachey (1993), Miller et al. (1993), and Golder Associates Inc. (1993). In FY 1993, the Civilian Radioactive Waste Management System Contractor was assigned the responsibility to plan, coordinate, and contribute to the second iteration of TSPA-2. Prior to initiating the next TSPA iteration, it was decided that it would be valuable to evaluate the applicability of RIP for use in this iteration. Therefore, analyses were conducted to compare the results generated by RIP to those reported in TSPA-1991. In particular, the aim was to generate a RIP input data set as equivalent as possible to that documented in Barnard et al. (1992) and to analyze the total system performance (as well as the performance of the individual subsystem components of the waste package/Engineered Barrier System (EBS), unsaturated gaseous flow and transport, unsaturated aqueous flow and transport, saturated flow and transport, and disruptive processes/events). The performance measure for comparison with the results of TSPA-1991 is the cumulative release of radionuclides to the accessible environment over a 10,000-year period following closure normalized to the US Environmental Protection Agency (EPA) release limits specified in 40 CFR 191.

25699 (DOE/WIPP–92-007) **Waste Isolation Pilot Plant: Site environmental report for calendar year 1991.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. [1991]. 1503p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE93015034. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) Waste Isolation Pilot Plant (WIPP) Operational Environmental Monitoring Plan (OEMP) monitors a comprehensive set of parameters in order to detect any potential environmental impacts and establish baselines for future quantitative environmental impact evaluations. Surface water and groundwater, air, soil, and biotics are measured for background radiation. Nonradiological environmental monitoring activities include air quality, water quality, soil properties, meteorological, and the status of the local biological community. Ecological studies focus on the immediate area surrounding the site with emphasis on the salt storage pile, whereas baseline radiological surveillance covers a broader geographic area including nearby ranches, villages, and cities. Since the WIPP is still in a preoperational state, and no waste has been received; certain elements required by DOE Order 5400.1 are not presented in this report. The most significant addition to the 1991 report is the inclusion of the first four appendices, the Radiological Baseline Program (DOE/WIPP 92-037), the Salt Impact Studies (DOE/WIPP 92-038), the Disturbed Land Reclamation Techniques (DOE/WIPP 92-039), and the Background Water Characterization for the WIPP (DOE/WIPP 92-013). These appendices are independently published and available to interested parties by the DOE reference number. These summaries will not be published in future ASER'S. They will, however, be referenced as a basis for evaluating similar data collected during the Test and subsequent Operational phases of the WIPP.

25700 (DOE/WIPP–93-012) **WIPP supplementary roof support system Room 1, Panel 1: Geotechnical field data analysis report.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. Mar 1993. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE93014889. Source: OSTI; NTIS; INIS; GPO Dep.

The design of the Room 1, Panel 1, supplementary roof support system was finalized in September 1991, and the system successfully installed in the test bin area between the bulkheads by December 1991. Simultaneously with the support system installation, existing monitoring system was upgraded to meet the needs of the installed roof support. This included extensometers, closure stations, rockbolt load cells as well as survey measurements of roof sag and floor lift. A Project Control Group (PCG) was established in order to monitor room and support system performance. Weekly meetings of the PCG were held to review all monitored data against criteria set in the initial design, and to modify these where necessary. Records of these meetings have been kept, with copies of all data summaries and action notes. These data records are maintained in the Engineering data files. After more than ten months of monitoring and reviewing experience, several modifications have been made both to the way data has been reported as well as to the load adjustment criteria. The support system has performed as expected in the design, with no signs of instability developing considering the rates of roof deformation, the rock bolt loads and the observed fracture behavior in the roof. This is particularly true of the horizon in which the rockbolt anchors are located, the most critical part of the design. The distribution of load build-up, throughout the 286 rockbolt load cells installed, in the Room 1 has been found satisfactory, and the load increases as evaluated by the PCG on a weekly basis have been within the acceptable range. The minimum life of the installed support system is estimated at 15 years based on the highest roof expansion rate experienced to date. This report provides analysis of geotechnical field data collected up to December 1992.

25701 (DPST–74-485) **Cost-benefit evaluation of compaction for solid TRU wastes.** Hootman, H.E. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Lab. 18 Sep 1974. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–591). Order Number DE93016190. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A study was made to evaluate costs/benefits that might result from mechanical compaction of solid transuranic wastes at Savannah River. The possible incentive for compaction is to reduce waste container costs during the interim before storage in an engineered facility. Results of the evaluation show that compaction of SRP-SRL wastes would increase the cost of present alpha waste storage. Annual operating costs to compact alpha waste would exceed the annual savings in container costs. In addition, the capital cost of the compaction facility, $200,000 to $1 million depending upon availability of space in an existing building, would not be recovered. This study is based on the assumption that compaction per se does not advance the waste to a form suitable for centuries long storage in an engineered facility.

25702 (EGG-ERTP–10647) **Summary report of project SIREN (Search, Intercept, Retrieve, Expulsion, Nuclear).** Buden, D. EG and G Idaho, Inc., Idaho Falls, ID (United States). Dec 1992. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93012332. Source: OSTI; NTIS; INIS; GPO Dep.

Project SIREN (Search, Intercept, Retrieve, Expulsion, Nuclear) has evaluated the technologies and operational strategies needed to rendezvous with and capture aerospace radioactive materials (e.g., a distressed or spent space reactor core) before such materials can reenter the terrestrial atmosphere and to move these captured materials to a space destination for proper disposal. The use of systems external to a satellite allows multiple attempts to prevent the nuclear materials from reentering the atmosphere. SIREN also has investigated means to prevent the breakup of nuclear-powered systems already in space. The SIREN project has determined that external means can be used reliably to prevent nuclear materials from reentering the terrestrial environment, prepared a computer model that can be used to evaluate the means to dispose of radioactive materials, assessed the hazards from existing nuclear power systems in space, and in discussions with Russian Federation representatives determined interest in joint activities in this area.

25703 (EGG-FSP–10603) **Experimental Tritium Cleanup System availability analysis from 1984 to 1992.** Cadwallader, L.C. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Taylor, G.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1993. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93016482. Source: OSTI; NTIS; INIS; GPO Dep.

This report gives the availability percentage of the Experimental Tritium Cleanup System (ETC) at the Tritium Systems Test Assembly (TSTA), which is a fusion research and technology facility at the Los Alamos National Laboratory. The component failure reports, the numbers of components, and operating times or demands are all given in this report. Sample calculations of the failure rates obtained from these data are given in the appendices. While future fusion experiments might use different or more advanced means to detritiate room air, the analysis of this system gives a data point for an actual detritiation system. Such a data point can be extrapolated for comparison with fault tree results on system designs, or can be used in a Bayesian failure rate analysis for estimating reliability of a new type of system. The nine years of testing operations on TSTA's ETC result in a reasonable average availability value of 92% for the maximal tritium release event. The failure rates for new systems are expected to be lower than for the TSTA ETC, since improvements will be made in the design of the room air detritiation system based on the TSTA system experiences. Nonetheless, these TSTA data should be useful for future fusion reactor design work and safety assessment tasks.

25704 (EGG-M–92558) **Application of lysimeter data as input to performance assessment evaluations of a low-level waste disposal facility.** McConnell, J.W. Jr. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Rogers, R.D.; Sullivan, T.M.; Jastrow, J .D.; Hicks, D.S.; Brey, R.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 18p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-930205–63: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93013662. Source: OSTI; NTIS; INIS; GPO Dep.

The Field Lysimeter Investigations: Low-Level Waste Data Base Development Program is obtaining information on the performance of radioactive waste in a disposal environment. Waste forms fabricated using ion-exchange resins from EPICOR-II are being tested to develop a low-level waste data base and to obtain information on survivability of waste forms in a disposal environment. The program includes examining radionuclide releases from waste forms in the first seven years of sampling. Also, lysimeter data are applied to performance assessment source term models, and initial results from use of data in two models are being studied.

25705 (EGG-WTD–10550) **Technical and regulatory review of the Rover nuclear fuel process for use on Fort St. Vrain fuel.** Hertzler, T. (Science Applications International Corp., Idaho Falls, ID (United States)). EG and G Idaho, Inc., Idaho Falls, ID (United States); Science Applications International Corp., Idaho Falls, ID (United States). Feb 1993. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93012187. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the results of an analysis for processing and final disposal of Fort St. Vrain (FSV) irradiated fuel in Rover-type equipment or technologies. This analysis includes an evaluation of the current Rover equipment status and the applicability of this technology in processing FSV fuel. The analyses are based on the physical characteristics of the FSV fuel and processing capabilities of the Rover equipment. Alternate FSV fuel disposal options are also considered including fuel-rod removal from the block, disposal of the empty block, or disposal of the entire fuel-containing block. The results of these analyses document that the current Rover hardware is not operable for any purpose, and any effort to restart this hardware will require extensive modifications and re-evaluation. However, various aspects of the Rover technology, such as the successful fluid-bed burner design, can be applied with modification to FSV fuel processing. The current regulatory climate and technical knowledge are not adequately defined to allow a complete analysis and conclusion with respect to the disposal of intact fuel blocks with or without the fuel rods removed.

The primary unknowns include the various aspects of fuel-rod removal from the block, concentration of radionuclides remaining in the graphite block after rod removal, and acceptability of carbon in the form of graphite in a high level waste repository.

25706 (ENEA-RT-AMB–91-15) **Option of sea-dumping and presentation of CRESP's results.** Cigna, A. ENEA, Saluggia (Italy). Centro Ricerche Energia - Area Energia Ambiente e Salute. Jul 1991. 10p. (CONF-901231–1: IRPA regional congress: sea dumping of low level radioactive waste-scientific radiation protection considerations, Paris (France), 11-12 Dec 1990; RT/AMB–91-15). Order Number DE93799303. Source: OSTI; NTIS (US Sales Only); INIS.

In Italy, sea-dumping was practised from 1946 until the mid-1960's on a national basis. Since 1967 it has been practised by a number of European countries under an international arrangement managed by the NEA-OECD. In 1983, sea-dumping was suspended after a resolution of the London Dumping Convention, and the moratorium is still in effect. The Co-ordinated Research and Environmental Surveillance Programme relevant to sea disposal of radioactive wastes (CRESP) was created by the NEA in 1981. CRESP developed a suitable data base and models to estimate doses to man and marine organisms with sufficient accuracy for the purpose of site suitability assessment. In order to improve the scientific data base and for a further refinement of radiological assessment, a more comprehensive work on the risks associated with sea dumping is being carried out. The results obtained to date are summarized in this paper and the future objectives and scope are also reported.

25707 (ETDE-IT–93-156) **Site restoration activity at ENEA Trisaia center.** Di Pace, L.; Pastore, C.; Ragazzo, G.; Risoluti, P. ENEA, Casaccia (Italy). 1992. 6p. (CONF-920851–95: Spectrum '92: nuclear and hazardous waste management international topical meeting, Boise, ID (United States), 23-27 Aug 1992). Order Number DE93799226. Source: OSTI; NTIS (US Sales Only); INIS.

During the operations of the ITREC reprocessing pilot plant at the ENEA (Italian Agency for Energy, New Technologies and the Environment) Trisaia Center (Southern Italy), about 1,000 cubic meters of solid LLW were produced and stored on the site. Some 600 cubic meters of these wastes were buried in a suitable area of the site. In 1989, restoration activities began at the site. The wastes were first retrieved from the burial site and conditioned by supercompaction and cementation. During the excavation operations, about 1,300 cubic meters of contaminated soil were also collected in drums. This paper describes the operations carried out for conditioning the solid LLW as well as the disposal concept envisaged for the contaminated soil. A 20,000 kN press was used to supercompact about 2,800 drums of recovered wastes in 400 lt overpacks suitable for final disposal. A volume reduction factor of 3.5 was achieved in the operations. About 50% of the contaminated soil, with gamma specific activity lower than 7.4 Bq/g, is planned to be disposed of in the excavated area confined by a high density polyethylene (HDPE) sheets, with a further barrier made of bentonite and clay. The remaining soil will be placed in large containers specially designed for long term outdoor storage. The system is being evaluated by the Safety Authority. A decision is expected by the end of 1992.

25708 (EUR–14043/4) **Assessment of management alternatives for LWR wastes. Volume 4. Description of a Belgian scenario for PWR waste.** Crustin, J. (Belgatom SA, Brussels (Belgium)); Glibert, R. Commission of the European Communities, Luxembourg (Luxembourg). 1993. [131p.] Contract FI1W/0124-B. Source: OSTI; NTIS (US Sales Only); INIS.

This report deals with the description of a management route for PWR waste relying to a certain extent on Belgian practices in this particular area. This description, which aims at providing input data for subsequent cost evaluation, includes all management steps which are usually implemented for solid, liquid and gaseous wastes from their production up to the interim storage of the final waste products. This study is part of an overall theoretical exercise aimed at evaluating a selection of management routes for LWR waste based on economical and radiological criteria.

25709 (EUR–14043/8) **Assessment of management alternatives for LWR wastes. Volume 8. Cost and radiological impact associated with near-surface disposal of reactor waste (Spanish concept).** Alamo Berna, S.; Sanchez Delgado, N. Commission of the European Communities, Luxembourg (Luxembourg). 1993. [53p.] Contract FI1W/127-E. Source: OSTI; NTIS (US Sales Only); INIS.

This report deals with the determination of the cost and the radiological impact associated with a near-surface disposal site (Spanish concept) for low and medium-level radioactive waste generated during operation of a 20 GWe nuclear park composed of LWRs for 30 years. This study is part of an overall theoretical exercise aimed at evaluating a selection of management routes for LWR waste based on economical and radiological criteria.

25710 (EUR–14232) **Evaluation of management alternatives for LWR hulls and caps.** Chaudon, L. (CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement); Klein, M.; Mehling, O.; Cecille, L.; Thiels, G.; Kowa, S. Commission of the European Communities, Luxembourg (Luxembourg). 1993. [293p.] Contract FI 1W-0260-F. Source: OSTI; NTIS (US Sales Only); INIS.

Hulls and caps resulting from the reprocessing of LWR spent fuels represent one of the major sources of alpha-bearing solid waste generated during the nuclear fuel cycle. The Commission of the European Communities has undertaken considerable R and D efforts on the development of advanced treatment and conditioning methods for this type of waste. In view of the encouraging results achieved, the Commission launched a theoretical assessment study on cladding waste management. Six practical or potential schemes were identified and elaborated: direct cementation, decontamination prior to cementation, rolling before cementation, rolling followed by embedding in graphite, compaction, and melting in a cold crucible. The economic aspects of each management option were also investigated. This included the assessment of the plant (treatment, conditioning and interim storage), transport and disposal costs. Further consideration will be required to define the best management option for 'cap' wastes. Transport and disposal costs will also require further analysis from an industrial standpoint.

25711 (IAEA-TECDOC–700, pp. 81-86) **A modular implementation of G2 on a solvent extraction process.** Robinson, G. (Salford Univ. Business Services Ltd, Salford (United Kingdom)); Mullhi, J.S.; Lamb, N. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9209356–: Specialists meeting/workshop on the potential of knowledge based systems in nuclear installations, Erlangen (Germany), 21-25 Sep 1992). In *The potential of knowledge based systems in nuclear installations: Report of a specialists' meeting/workshop held in Erlangen, Germany, 21-25 September 1992.* [97p.] Order Number DE93629675. Source: OSTI; NTIS (US Sales Only); INIS.

The application of G2 to a solvent extraction process is presented, covering topics throughout the development cycle from conceptual design and development to implementation. Attention is paid to issues surrounding modular development within the G2 environment and the possibilities for cooperative team-based approaches. A brief description of the application architecture introduces two example modules, spc.kl a knowledge library concerned with providing statistical process control, and proc.kl a knowledge library for the implementation of plant operating procedures. (author). 4 figs.

25712 (INIS-mf–12758, pp. 381-389) **Description of project for pretreatment and storage of wastes of L.P.R. (Radiochemical Processes Laboratory).** Doval, J.C.F. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Procesos Quimicos); Mehlich, A.M.; Quilici, D.F. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of the project is to allow the start up and operation of LPR (Radiochemical Processes Laboratory) as part of the intended

activities in the plant. In this paper, the pretreatment and storage of liquid wastes generated at the LPR are described. The pretreatment section will be set up inside the shielded cells already existent in the LPR, where a previous concentration through the evaporation of liquid wastes will take place. The storage section has to be constructed on purpose in order to temporarily store the concentrates. The cells of transference and preconditioning of solid wastes are also described. These cells will be mounted inside the building, allowing the handling of radioactive solids generated as effluents during the reprocessing plan. In the description, the use of non conventional materials for the boiler making and the construction of cells is specially mentioned. (Author).

25713 (INIS-mf–12758, pp. 370-374) **Diffusion of actinides in salt and vitreous-salt matrix interaction.** Dyment, F. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Dept. de Materiales); Matzke, H. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The results obtained for the Rb diffusion in glasses designed to contain high level radioactive wastes, are presented. The glasses studied: VG 98/12 (VG = Versuchsglas) used as base and Gp 98/12 (Gp = Glasprodukt) similar to the previous ones, but with the aggregation of simulated fission products oxides, corrosion products and UO_2, were developed at the Institute fur Nuclear Entsorgung, Kernforschungzentrum, KfK, Germany. Such results were compared with those obtained for Cs and Na diffusion in the same glasses. The damage effect produced by irradiation in Rb and Cs implantation on both diffusion is analyzed, comparing the diffusion measurements performed from other methods which do not infer damage irradiation. The effect of 'alkali mixture' on their mobility is analyzed. In single alkaline glasses, of the $(1 - x)A'_2O - xA''_2O - nSiO_2$ type (A' and A" are two alkaline elements and $n \approx 3$ to 5), the gradual substitution of an alkaline ion for another one decreases significantly the auto diffusion coefficient of the replaced ion, increasing the activation enthalpy. The opposite occurs with the other ion. In the case of much more complex glasses which will be used to store radioactive wastes, the question is if by effect of Na-contents variation -due to irradiation damage effects, diffusion in thermal gradients or leaching- may significantly change the mobility of the other alkaline ions: Rb and Cs, particularly Cs^{137}. (Author).

25714 (INIS-mf–12758, pp. 375-380) **Treatment of radioactive wastes containing plutonium.** Orlando, O.S. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Dept. de Combustibles Nucleares); Aparicio, G.; Greco, L.; Orosco, E.H.; Cassaniti, P.; Salguero, D.; Toubes, B.; Perez, A.E.; Menghini, J.E.; Esteban, A.; Adelfang, P. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The radioactive wastes generated in the process of manufacture and control of experimental fuel rods of mixed oxides, $(U,Pu)O_2$, require an specific treatment due to the plutonium content. The composition of liquid wastes, mostly arising from chemical checks, is variable. The salt content, the acidity, and the plutonium and uranium content are different, which makes necessary a chemical treatment before the inclusion in concrete. The solid waste, such as neoprene gloves, PVC sleeves, filter paper, disposable or broken laboratory material, etc. are also included in concrete. In this report the methods used to dispose of wastes at Alpha Facility are described. With regard to the liquid wastes, the glove box built to process them is detailed, as well as the applied chemical treatment, including neutralization, filtration and later solidification. As for the solid wastes, it is described the cementation method consisting in introducing them into an expanded metal matrix, of the basket type, that contains as a concentric drum of 200 liter capacity which is smaller than the matrix, and the filling with wet cement mortar. (Author).

25715 (INIS-mf–13544, pp. 121-128) **Radiation deactivations of the long-life lived radioactive wastes with the help of median energy protons.** Zelenskij, V.F. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.); Neklyudov, I.M.; Ozhigov, L.S. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

Specific energy expenses for one ^{137}Cs atom transmutation using 10-100 MeV protons, full absorption targets and targets which depths for any energy correspond to 10, 50, 100, 200 and 400 MeV proton energy losses were calculated. The obtained results show that there exists an optimal proton energy in this range for which a maximum transmutation level is obtained and this level is nearly the same as for 1 GeV protons. This indicates that a proton accelerator can be used for decontamination of nuclear power wastes. 5 refs.; 6 figs. (J.P.).

25716 (IPEN-PUB–371) **Characterization of wastes from fission ^{99} Mo production.** Endo, L.S.; Dellamano, J.C. Instituto de Pesquisas Energeticas e Nucleares (IPEN), Sao Paulo, SP (Brazil). Jul 1992. [41p.] (In Portuguese). Order Number DE93629784. Source: OSTI; NTIS (US Sales Only); INIS.

This work is a preliminary study on waste-streams generated in a fission ^{99} Mo production plant, their characterization and quantification. The study is based on a plant whose ^{99} Mo production process is the alkaline dissolution of U-target. The target is made of 1 g of enriched ^{235} U, therefore most of radionuclides present in the waste-streams are fission products. All the radionuclides inventories were estimated based on ORIGEN-2 Code. The characterization was done as a primary stage for the establishment of waste management plan, which should be subject for further study. (author).

25717 (IPEN-PUB–372) **Radioisotope content of wastes generated in ^{99} Mo production.** Vicente, R.; Dellamano, J.C.; Endo, L.S. Instituto de Pesquisas Energeticas e Nucleares (IPEN), Sao Paulo, SP (Brazil). Jul 1992. [93p.] (In Portuguese). Order Number DE93629783. Source: OSTI; NTIS (US Sales Only); INIS.

Many radioactive waste streams arise in the production of ^{99} Mo, each one with a fraction of the initial radioactive content of the irradiated uranium target. Eight relevant waste streams were identified - four liquid wastes, three solid wastes and one gaseous waste stream, which upon filtration constitutes another solid waste stream. The fractions of the elements initially present in the targets that are present in each stream were determined previously. In this report, the activity decay and the activity buildup in the liquid storage tanks and in the dry solid storages are mathematically modeled so that the waste activity after one year of radioisotope production can be estimated. The activities present in each drum of immobilized or encapsulated waste, generated upon treatment of those eight waste streams, are also calculated assuming that the drums will conform to type A 1 packages for the transportation of radioactive materials. (author).

25718 (IPEN-PUB–375) **Recovering of thorium contained in wastes from Thorium Purification Plant.** Brandao Filho, D.; Hespanhol, E.C.B.; Baba, S.; Miranda, L.E.T.; Araujo, J.A. de. Instituto de Pesquisas Energeticas e Nucleares (IPEN), Sao Paulo, SP (Brazil). Aug 1992. [25p.] (In Portuguese). (CONF-8910496–: 14. annual symposium of the ACIESP, Sao Paulo (Brazil), 9-13 Oct 1989). Order Number DE93629071. Source: OSTI; NTIS (US Sales Only); INIS.

A study has been developed in order to establish a chemical process for recovering thorium from wastes produced at the Thorium Purification Plant of the Instituto de Pesquisas Energeticas e Nucleares. The recovery of thorium in this process will be made by means of solvent extraction technique. Solutions of TBP/Varsol were employed as extracting agent during the runs. The influence of thorium concentration in the solution, aqueous phase acidity,

volume ratio of the phases, percentage of TBP/Varsol and the contact time of the phases on the extraction of thorium and lanthanides was determined. (author).

25719 (JAERI-M–93-037) **Progress report on safety research on high-level waste management for the period April 1991 to March 1992.** Muraoka, Susumu (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Senoo, Muneaki; Kobayashi, Yoshii (eds.). Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 78p. Order Number DE93797620. Source: OSTI; NTIS; INIS.

Research on high-level waste management at the Engineered Barrier Materials Laboratory, Environmental Geochemistry Laboratory and Environmental Radiochemistry Laboratory of the Department of Environmental Safety Research, JAERI in the fiscal year of 1991 are described. The topics are as follows: (1) As for waste forms and engineered barrier material, performance assessment studies on glass, ceramic and buffer materials were carried out. (2) In the safety evaluation study for geological disposal, behavior of radionuclide in deep underground water, nuclide migration in-situ and natural groundwater flow system were studied. (3) Changes in layer charge of smectite, alteration of uranium mineral and uranium fixation in uranium ore were examined as a natural analogue study. (author).

25721 (KEMAKTA-AR–92-08) **Basis for criteria for exemption of decommissioning waste: reprocessing of dust from recycling of steel.** Elert, M.; Wiborgh, M. Kemakta Konsult AB, Stockholm (Sweden). Jun 1992. [38p.] Order Number DE93631579. Source: OSTI; NTIS; INIS.

This study is a part of a larger study with the purpose to provide the authority concerned, the Swedish Radiation Protection Institute (SSI), with technical background material needed for future decisions concerning exemption levels for recycling and disposal of material originating from decommissioned nuclear power reactors. The dismantling of nuclear power reactors will give rise to large amounts of steel scrap with a very low activity concentration. It is of interest to exempt this material from regulatory control in order to make recycling possible. During the melting of steel scrap dust will be formed which is collected in the off-gas cleaning system of the furnace. Radionuclides may be enriched in this dust, and thereby obtain a higher activity concentration than the melted scrap. Presently, there is a strong interest to reprocess these dusts with the objectives to recover valuable metals and to reduce the amounts of waste harmful to the environment. During the reprocessing of dusts collected from the melting process a further redistribution and reconcentration of radionuclides may occur. In this report the treatment of dust from steel melting is described, the potential reconcentration of radionuclides is analyzed, and the potential radiological consequences are estimated. The study has focussed on the reprocessing of dust with the plasma method used at ScanDust in Sweden, and with the Waelz process used in, for example Spain and Germany. Various factors as economical, political and future developments of dust treatment and steel processes will determine the amounts of dusts produced and also to what degree dust will be reprocessed in the future. (au).

25722 (K/TCD–1054) **Electroosmotic decontamination of concrete.** Bostick, W.D. (Oak Ridge K-25 Site, TN (United States)); Bush, S.A.; Marsh, G.C.; Henson, H.M.; Box, W.D.; Morgan, I.L. Oak Ridge K-25 Site, TN (United States). Mar 1993. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OT21400. Order Number DE93010258. Source: OSTI; NTIS; INIS; GPO Dep.

A method is described for the electroosmotic decontamination of concrete surfaces, in which an electrical field is used to induce migration of ionic contaminants from porous concrete into an electrolyte solution that may be disposed of as a low-level liquid radioactive waste (LLRW); alternately, the contaminants from the solution can be sorbed onto anion exchange media in order to prevent contaminant buildup in the solution and to minimize the amount of LLRW generated. We have confirmed the removal of uranium (and infer the removal of ^{99}Tc) from previously contaminated concrete surfaces. In a typical experimental configuration, a stainless steel mesh is placed in an electrolyte solution contained within a diked cell to serve as the negative electrode (cathode) and contaminant collection medium, respectively, and an existing metal penetration (e.g., piping, conduit, or rebar reinforcement within the concrete surface) serves as the positive electrode (anode) to complete the cell. Typically we have achieved 70 to >90% reductions in surface activity by applying <400 V and <1 A for 1–3 h (energy consumption of 0.4–12 kWh/ft^2).

25723 (LA–12589-MS) **Evaluation of ferrocyanide/nitrate explosive hazard.** Cady, H.H. Los Alamos National Lab., NM (United States). Jun 1992. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93015655. Source: OSTI; NTIS; INIS; GPO Dep.

Los Alamos National Laboratory agreed to assist Pacific Northwest Laboratory in the Ferrocyanide Safety Evaluation Program by helping to evaluate the explosive hazard of several mixtures of simulated ferrocyanide waste-tank sludge containing sodium nitrite and sodium nitrate. This report is an evaluation of the small-scale safety tests used to assess the safety of these materials from an explosive point of view. These tests show that these materials are not initiated by mechanical insult, and they require an external heat source before any exothermic chemical reaction can be observed.

25724 (LA-SUB–93-164) **Assessment of greater-than-Class C waste at Los Alamos National Laboratory.** Shuman, R. (Rogers and Associates Engineering Corp., Salt Lake City, UT (United States)); Jennrich, E.A.; Merrell, G.B. Los Alamos National Lab., NM (United States); Rogers and Associates Engineering Corp., Salt Lake City, UT (United States). Feb 1991. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (RAE–8915/3-3). Order Number DE93010746. Source: OSTI; NTIS; INIS; GPO Dep.

Department of Energy (DOE) Order 5820.2A regulates the onsite disposal of low-level radioactive waste (LLW) at all DOE facilities. Among its stipulations, the Order states that "Disposition of wastes designated as greater-than-Class C, as defined in 10 CFR 61.55 must be handled as special cases. Disposal systems for such waste must be justified by a specific performance assessment." Los Alamos National Laboratory (LANL) personnel have undertaken a review and performance assessment of LLW disposal at its Area-G disposal facility, which is described in this report.

25725 (LA-UR–93-1205) **Hazardous waste treatment facility and skid-mounted treatment systems at Los Alamos.** Lussiez, G.W.; Zygmunt, S.J. Los Alamos National Lab., NM (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930873–6: 2. international mixed waste symposium, Baltimore, MD (United States), 17-20 Aug 1993). Order Number DE93012660. Source: OSTI; NTIS; INIS; GPO Dep.

To centralize treatment, storage, and staging areas for hazardous wastes, Los Alamos National Laboratory has designed a 12,000-ft^2 hazardous waste treatment facility. The facility will house a treatment room for each of four kinds of wastes: nonradioactive characteristic wastes, nonradioactive listed wastes radioactive characteristic wastes, and radioactive listed wastes. The facility will be used for repacking labpacks, bulking small organic waste volumes, processing scintillation vials, treating reactives such as lithium hydride and pyrophoric uranium, treating contaminated solids such as barium sand, and treating plating wastes. The treated wastes will then be appropriately disposed of. This report describes the integral features of the hazardous waste treatment facility.

25726 (LA-UR–93-1598) **Field studies of engineered barriers for closure of low level radioactive waste landfills at Los Alamos, New Mexico, USA.** Nyhan, J.W.; Langhorst, G.J.; Martin, C.E.; Martinez, J.L.; Schofield, T.G. Los Alamos National Lab., NM (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930906–8: '93 international conference on nuclear waste management and environmental remediation, Prague (Czech Republic), 5-11 Sep 1993). Order Number DE93012725. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos National Laboratory examined water balance relationships for four different landfill cover designs containing engineered barriers. These field experiments were performed at Los Alamos, New Mexico, USA, in 1.0- by 10.0-m plots with downhill slopes of 5, 10, 15, and 25%. Field measurements of seepage, precipitation, interflow, runoff, and soil water content were collected in each of the 16 plots representing four slopes each with four cover designs: Conventional, EPA, Loam Capillary Barrier and Clay Loam Capillary Barrier. A seepage collection system was installed beneath each cover design to evaluate the influence of slope length on seepage using a series of four metal pans filled with medium gravel that were placed end-to-end in the bottom of each field plot. An automated water flow data logging system was used to collect hourly seepage, interflow and runoff data and consisted of 100 100-liter tanks, each of which was equipped with an ultrasonic liquid-level sensor and a motor-operated ball valve used to drain the tank. Soil water content was routinely monitored every six hours at each of 212 locations throughout the 16 plots with time domain reflectrometry (TDR) techniques using an automated and multiplexed measurement system. Field data is presented to show the effects of slope and slope length on the performance of each landfill cover design for the first 15 months of this field experiment.

25727 (LA-UR–93-1960) **Los Alamos aqueous target/blanket system design for the accelerator transmutation of waste concept.** Cappiello, M.; Ireland, J.; Sapir, J.; Krohn, B. Los Alamos National Lab., NM (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930913–1: Global '93: future nuclear systems - emerging fuel cycles and waste disposal options, Seattle, WA (United States), 12-17 Sep 1993). Order Number DE93014355. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos Accelerator Transmutation of Nuclear Waste (ATW) concept uses an accelerator driven neutron source (target) surrounded by a moderator and multiplying medium (blanket) for the transmutation of actinide and fission product waste. The reference target/blanket desip is an aqueous system that uses heavy water (D_2O) for the target coolant, blanket moderator, actinide slurry carrier fluid, and fission product solution. The solid tungsten target produces neutrons efficiently and with a minimum of parasitic capture using an innovative flux-trap design. The blanket consists of regions for fission products and actinide transmutation and employs a heat-transfer loop similar to the CANDU reactor. Neutronics and thermal-hydraulic calculations indicate that each of the four ATW target/blanket modules operating at a k_{eff} of 0.95, combined with a 1600-MeV, 62.5-mA proton beam, can transmute the actinide waste, the technetium, and iodine waste from two light water reactors. In addition, by recovering some of the fission heat, we can produce sufficient electricity to power the accelerator.

25728 (LBL–23593) **Preliminary capillary hysteresis simulations for fractured rocks – model development and results of simulations.** Niemi, A.; Bodvarsson, G.S. Lawrence Berkeley Lab., CA (United States). Nov 1991. 85p. Sponsored by USDOE, Washington, DC (United States); Department of the Interior, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015280. Source: OSTI; NTIS; GPO Dep.

As part of the code development and modeling work being carried out to characterize the flow in the unsaturated zone at Yucca Mountain, Nevada, capillary hysteresis models simulating the history-dependence of the characteristic curves have been developed. The objective of the work has been both to develop the hysteresis models, as well as to obtain some preliminary estimates of the possible hysteresis effects in the fractured rocks at Yucca Mountain given the limitations of presently available data. Altogether three different models were developed based on work of other investigators reported in the literature. In these three models different principles are used for determining the scanning paths: in model (1) the scanning paths are interpolated from tabulated first-order scanning curves, in model (2) simple interpolation functions are used for scaling the scanning paths from the expressions of the main wetting and main drying curves and in model (3) the scanning paths are determined from expressions derived based on the dependent domain theory of hysteresis.

25729 (LBL–33597) **Modeling of strongly heat-driven flow processes at a potential high-level nuclear waste repository at Yucca Mountain, Nevada.** Pruess, K.; Tsang, Y. Lawrence Berkeley Lab., CA (United States). Jan 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098 ;AC04-76DP00789. (CONF-930408–59: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93010450. Source: OSTI; NTIS; INIS; GPO Dep.

Two complementary numerical models for analyzing high-level nuclear waste emplacement at Yucca Mountain have been developed. A vertical cross-sectional (X-Z) model permits a realistic representation of hydrogeologic features, such as alternating tilting layers of welded and non-welded tuffs. fault zones, and surface topography. An alternative radially symmetric (R-Z) model is more limited in its ability to describe the hydrogeology of the site, but is better suited to model heat transfer in the host rock. Our models include a comprehensive description of multiphase fluid and heat flow processes, including strong enhancements of vapor diffusion from pore-level phase change effects. The neighborhood of the repository is found to partially dry out from the waste heat. A condensation halo of large liquid saturation forms around the drying zone, from which liquid flows downward at large rates. System response to infiltration from the surface and to ventilation of mined openings is evaluated. The impact of the various flow processes on the waste isolation capabilities of the site is discussed.

25730 (MHSMP–92-41) **Laboratory solvent reuse – Liquid chromatography.** Quinlin, W.T.; Schaffer, C.L. Mason and Hanger-Silas Mason Co., Inc., Amarillo, TX (United States). Nov 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL65030. Order Number DE93009948. Source: OSTI; NTIS; GPO Dep.

The objective of this work was to develop a method for reduction of waste solvent in the Process Engineering Chemistry Laboratory. The liquid chromatographs are the largest generators of explosive-contaminated waste in the laboratory. We developed a successful process for the reuse of solvents from the liquid chromatographs and demonstrated the utility of the process in the assay of hexanitrostilbene.

25731 (NEI-SE–117) **Treatment and final disposal of nuclear waste. Aespoe hard rock laboratory.** Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Sep 1992. [89p.] Order Number DE93631589. Source: OSTI; NTIS; INIS.

Background report to RD and D Programme 92.

The scientific investigations within SBK's research programme are a part of the work of designing a deep repository and identifying and investigating a suitable site. A balanced appraisal of the facts, requirements and assessments presented in connection with the preparation of R and D-programme 86 led to the proposal to construct an underground research laboratory. This proposal was presented in the aforementioned research programme and was very positively recived by the reviewing bodies. In the autumn of 1986, SKB initiated the field work for the siting of an underground laboratory, the Aespoe hard rock laboratory, in the Simpevarp area in the municipality of Oskarshamn. At the end of 1988, SKB arrived at a decision in principle to site the facility on southern Aespoe about 2 km north of the Oskarshamn nuclear power station. After regulatory review, SKB ordered the excavation of the access tunnel to the Aespoe hard rock laboratory to commence in the autumn of 1990. In conjunction with the tunneling work, which has now (September 1992) reached a depth of more than 200 m, a large number of investigations have been carried out. This background report to SKB's RD and D-programme 92 is based on the previous and 89 /

2/. The report provides a general background and presents goals, projects results obtained to date and future work. Compared to the previous background reports, more space is devoted here to experiment planning and the future demonstration programme. (au).

25732 (NUREG/CR–5943) **Sensitivity analysis and benchmarking of the BLT low-level waste source term code.** Suen, C.J. (Brookhaven National Lab., Upton, NY (US)); Sullivan, T.M. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; Brookhaven National Lab., Upton, NY (United States). Jul 1993. 78p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (BNL-NUREG–52346). Source: OSTI; NTIS; INIS; GPO.

To evaluate the source term for low-level waste disposal, a comprehensive model had been developed and incorporated into a computer code, called BLT (Breach-Leach-Transport) Since the release of the original version, many new features and improvements had also been added to the Leach model of the code. This report consists of two different studies based on the new version of the BLT code: (1) a series of verification/sensitivity tests; and (2) benchmarking of the BLT code using field data. Based on the results of the verification/sensitivity tests, the authors concluded that the new version represents a significant improvement and it is capable of providing more realistic simulations of the leaching process. Benchmarking work was carried out to provide a reasonable level of confidence in the model predictions. In this study, the experimentally measured release curves for nitrate, technetium-99 and tritium from the saltstone lysimeters operated by Savannah River Laboratory were used. The model results are observed to be in general agreement with the experimental data, within the acceptable limits of uncertainty.

25733 (NUREG/CR–5987) **Microbial-influenced cement degradation: Literature review.** Rogers, R.D. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Hamilton, M.A.; McConnell, J.W. Jr. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; EG and G Idaho, Inc., Idaho Falls, ID (United States). Mar 1993. 26p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (EGG–2695). Source: OSTI; NTIS; INIS; GPO.

The Nuclear Regulatory Commission stipulates that disposed low-level radioactive waste (LLW) be stabilized. Because of apparent ease of use and normal structural integrity, cement has been widely used as a binder to solidify LLW. However, the resulting waste forms are sometimes susceptible to failure due to the actions of waste constituents, stress, and environment. This report reviews literature which addresses the effect of microbiologically influenced chemical attack on cement-solidified LLW. Groups of microorganisms are identified, which are capable of metabolically converting organic and inorganic substrates into organic and mineral acids. Such acids aggressively react with concrete and can ultimately lead to structural failure. Mechanisms inherent in microbial-influenced degradation of cement-based material are the focus of this report. This report provides sufficient evidence of the potential for microbial-influenced deterioration of cement-solidified LLW to justify the enumeration of the conditions necessary to support the microbiological growth and population expansion, as well as the development of appropriate tests necessary to determine the resistance of cement-solidified LLW to microbiological-induced degradation that could impact the stability of the waste form.

25734 (ORNL/ER–12) **Investigation of the organic matter in inactive nuclear tank liquids: Environmental Restoration Program.** Schenley, R.L.; Griest, W.H. Oak Ridge National Lab., TN (United States). Aug 1990. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93014339. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Protection Agency (EPA) methodology for regulatory organics fails to account for the organic matter that is suggested by total organic carbon (TOC) analysis in the Oak Ridge National Laboratory (ORNL) inactive nuclear waste-tank liquids and sludges. Identification and measurement of the total organics are needed to select appropriate waste treatment technologies. An initial investigation was made of the nature of the organics in several waste-tank liquids. This report details the analysis of ORNL wastes.

25735 (ORNL/ER/Sub–87-99053/64) **Waste management plan for the remedial investigation/feasibility study of Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee: Environmental Restoratin Program.** Oak Ridge National Lab., TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States). Dec 1992. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93009335. Source: OSTI; NTIS; INIS; GPO Dep.

This plan defines the criteria and methods to be used for managing waste generated during activities associated with Waste Area Grouping (WAG) 5 at Oak Ridge National Laboratory (ORNL). WAG 5 is located in Melton Valley, south of the main ORNL plant area. It contains 17 solid waste management units (SWMUs) to be evaluated during the remedial investigation. The SWMUs include three burial areas, two hydrofracture facilities, two settling ponds, eight tanks, and two low-level liquid waste leak sites. These locations are all considered to be within the WAG 5 area of contamination (AOC). The plan contains provisions for safely and effectively managing soils, rock cuttings, development and sampling water, decontamination fluids, and disposable personal protective equipment (PPE) consistent with the Environmental Protection Agency (EPA) guidance of May 1991 (EPA 1991). Consistent with EPA guidance, this plan is designed to protect the environment and the health and safety of workers and the public.

25736 (ORNL/FTR–4496) **[Transportation/geologic repository interface requirements for high level radioactive waste and spent nuclear fuel]: Foreign trip report, November 7–24, 1992.** Pope, R.B. Oak Ridge National Lab., TN (United States). 9 Dec 1992. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93009563. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended and participated in two meetings at the International Atomic Energy Agency (IAEA) in Vienna, Austria. The first meeting was the Advisory Group Meeting on Transportation/Geologic Repository Interface Requirements for High Level Radioactive Waste and Spent Nuclear Fuel. The second meeting was the Consultants Services Meeting on Low Specific Activity and Surface Contaminated Object Material. The consultants initiated their work using a set of working papers provided by the Agency, with the goal of providing the Agency with recommendations on a Low Specific Activity Material Q-System Analogue for defining activity limits, materials specifications, and packaging requirements for such materials. The consultants' efforts resulted in a modified but unreviewed draft position paper and associated documentation of the consultants' deliberations; these documents were to be typed by the IAEA, forwarded to the consultants for review, and when modified by the IAEA based upon the consultants' comments, circulated for review by member states to serve as a basis for further consideration by the IAEA in future meetings.

25737 (ORNL/TM–11838) **In situ grouting of low-level burial trenches with a cement-based grout at Oak Ridge National Laboratory.** Francis, C.W.; Spence, R.D.; Tamura, T.; Spalding, B.P. Oak Ridge National Lab., TN (United States). Jan 1993. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012513. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication No. 3872.

A technology being evaluated for use in the closure of one of the low-level radwaste burial grounds at ORNL is trench stabilization using a cement-based grout. To demonstrate the applicability and effectiveness of this technology, two interconnecting trenches in SWSA 6 were selected as candidates for in situ grouting with a particulate grout. The primary objective was to demonstrate the increased trench stability (characterized by trench penetration tests) and the decreased potential for leachate migration (characterized by hydraulic conductivity tests) following in situ injection of a particulate grout into the waste trenches. Stability against trench subsidence is a critical issue. For example, construction of impermeable covers to seal the trenches will be ineffectual unless subsequent trench subsidence is permanently suspended. A grout composed of 39% Type 1 Portland cement, 55.5% Class F fly ash,

and 5.5% bentonite mixed at 12.5 lb/gal of water was selected. Before the trenches were grouted, the primary characteristics relating to physical stability, hydraulic conductivity, and void volume of the trenches were determined. Their physical stability was evaluated using soil-penetration tests.

25738 (ORNL/TM–12058) **Simulation of barrier heterogeneity and preferential flow effects on the performance of shallow land burial facilities.** Luxmoore, R.J.; Tharp, M.L. Oak Ridge National Lab., TN (United States). Mar 1993. 38p. Sponsored by Environmental Protection Agency, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93009337. Source: OSTI; NTIS; GPO Dep.

Environmental Sciences Division Publication No. 3844.

Compacted soil barriers constructed at landfill sites have some degree of heterogeneity in hydraulic properties that may lead to a decline in barrier integrity and performance. A computer modeling study of the water dynamics of compacted soil barriers for a mesic site in eastern Tennessee was undertaken to identify possible situations that could lead to barrier failure. A water dynamics model for soil-plant systems (UTM) was applied to three landful construction scenarios, and varying degrees of heterogeneity of hydraulic properties for the cap and liner were introduced with a scaling procedure. Simulations were conducted for three annual contrasting rainfall conditions, and sensitivity analysis and Monte Carlo methods were used in the investigation.

25739 (ORNL/TM–12315) **Development and testing of ion exchangers for treatment of liquid wastes at Oak Ridge National Laboratory.** Collins, J.L. (Oak Ridge National Lab., TN (United States)); Davidson, D.J.; Chase, C.W.; Egan, B.Z.; Ensor, D.D.; Bright, R.M.; Glasgow, D.C. Oak Ridge National Lab., TN (United States). Mar 1993. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013460. Source: OSTI; NTIS; INIS; GPO Dep.

This report addresses three areas of waste treatment: (1) treatment of newly generated low-level liquid waste and Melton Valley Storage Tank (MVST) supernate using inorganic ion exchangers; (2) treatment of processing streams at the Radiochemical Engineering Development Center (REDC); and (3) removal of radionuclides from organic solutions. Distribution of various radionuclides between simulated waste solutions and several sorbents was determined in batch tests. Inorganic ion exchangers were prepared in the form of microspheres by an internal gelation process. Microspheres of hydrous titania, hydrous zirconia, hydrous titania containing embedded sodium cobalt hexacyanoferrate, and the corresponding phosphate forms of these materials were prepared. Several zeolites (PDZ-140, PDZ-300, EE-96, CBV-10A) and inorganic ion exchangers (hydrous titania, hydrous zirconia, polyantimanic acid, sodium cobalt hexacyanoferrate) were tested for the removal of cesium and strontium from the acidic simulated Cleanex raffinate generated at REDC. A resorcinol-based ion-exchange resin and three types of sodium titanate were tested for removal of cesium and strontium from the REDC caustic dissolver solution. Hydrous titania, hydrous zirconia, and their corresponding phosphates were tested for the removal of Eu^{3+} from various solutions of di-2-ethylbexyl phosphoric acid (HDEHP) in toluene or dodecane.

25740 (PNL–8266) **Methods of chemical analysis for organic waste constituents in radioactive materials: A literature review.** Clauss, S.A.; Bean, R.M. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93008627. Source: OSTI; NTIS; INIS; GPO Dep.

Most of the waste generated during the production of defense materials at Hanford is presently stored in 177 underground tanks. Because of the many waste treatment processes used at Hanford, the operations conducted to move and consolidate the waste, and the long-term storage conditions at elevated temperatures and radiolytic conditions, little is known about most of the organic constituents in the tanks. Organics are a factor in the production of hydrogen from storage tank 101-SY and represent an unresolved safety question in the case of tanks containing high organic carbon content. In preparation for activities that will lead to the characterization of organic components in Hanford waste storage tanks, a thorough search of the literature has been conducted to identify those procedures that have been found useful for identifying and quantifying organic components in radioactive matrices. The information is to be used in the planning of method development activities needed to characterize the organics in tank wastes and will prevent duplication of effort in the development of needed methods.

25741 (PNL–8438) **Exploratory study of complexant concentrate waste processing.** Lumetta, G.J.; Bray, L.A.; Kurath, D.E.; Morrey, J.R.; Swanson, J.L.; Wester, D.W. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93008949. Source: OSTI; NTIS; GPO Dep.

The purpose of this exploratory study, conducted by Pacific Northwest Laboratory for Westinghouse Hanford Company, was to determine the effect of applying advanced chemical separations technologies to the processing and disposal of high-level wastes (HLW) stored in underground tanks. The major goals of this study were to determine (1) if the wastes can be partitioned into a small volume of HLW plus a large volume of low-level waste (LLW), and (2) if the activity in the LLW can be lowered enough to meet NRC Class LLW criteria. This report presents the results obtained in a brief scouting study of various processes for separating radionuclides from Hanford complexant concentrate (CC) waste.

25742 (PNL–8518) **Similarity analysis applied to the design of scaled tests of hydraulic mitigation methods for Tank 241-SY-101.** Liljegren, L.M. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93007930. Source: OSTI; NTIS; INIS; GPO Dep.

The episodic gas releases from Tank 241-SY-101 (SY-101) pose a potential safety hazard. It is thought that gas releases occur because gases are generated and trapped in layers of settled solids located at the bottom of the tank. This document focuses on issues associated with testing of hydraulic mitigation technologies proposed for SY-101. The basic assumption underlying the concept of hydraulic mitigation is that mobilization or maintained suspension of the solids settled in the bottom of the tank wig prevent gas accumulation. Engineering of hydraulic technologies will require testing to determine the operating parameters required to mobilize the solids and to maintain these solids in suspension. Because full scale testing is extremely expensive (even when possible), scaled tests are needed to assess the merit of the proposed technologies and to provide data for numerical or analytical modeling. This research is conducted to support testing and evaluation of proposed hydraulic mitigation concepts only. The work here is oriented towards determining the jet velocities, nozzle sizes, and other operating parameters required to mobilize the settled solids in SY-101 and maintain them in suspension.

25743 (PNL–8601) **Pretreatment of Plutonium Finishing Plant (PFP) sludge: Report for the period October 1990–March 1992.** Lumetta, G.J.; Swanson, J.L. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93014684. Source: OSTI; NTIS; INIS; GPO Dep.

The current mission of the US Department of Energy's Hanford Site is one of environmental restoration. A major task within this mission is the disposal of large volumes of high-level wastes (HLW) that are stored in underground tanks on the site. Under the current planning assumptions, all high-level tank waste will be vitrified as borosilicate glass and then disposed of in a geologic repository. The costs associated with this disposal scheme are very high. Thus, methods to reduce the volume of glass required to vitrify these wastes are currently being investigated. Plutonium Finishing Plant (PFP) sludge is a unique transuranic waste that is stored in tank 241- SY-102 on the Hanford site. As the name implies, the bulk of this material consists of waste from operations at the Plutonium Finishing Plant; but, other wastes have also been added (e.g., wastes from decontamination activities). Because the quantities of plutonium and americium in the PFP sludge are greater than 100 nCi/g, this sludge must be handled as a HLW. Approximately 6000 glass canisters would result from vitrifying this waste directly. Sludge washing would reduce the required number

of canisters to ~2500, with the volume of glass being driven by the low allowable concentration limit for Cr in the vitrification plant feed. The cost of production and subsequent geologic disposal of each canister of glass is expected to be $0.5 M to $1 M. Thus, an economic incentive exists to develop methods of pretreating the sludge to reduce the number of glass canisters needed to contain the final vitrified product.

25744 (PNL-SA–21455) **Effect of potential Hanford ferrocyanide waste constituents on the reaction between ferrocyanide and nitrates/nitrites.** Scheele, R.D.; Burger, L.L.; Sell, R.L. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930205–57: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93010189. Source: OSTI; NTIS; INIS; GPO Dep.

During the 1950s, ferrocyanide- and nitrate-bearing wastes were produced at Hanford. A concern about continued safe storage and future treatment of these wastes has arisen because ferrocyanide and nitrate mixtures can explode when heated. Because of this concern, the Pacific Northwest Laboratory has performed experimental studies to determine the conditions needed to continue storing the wastes safely. In this paper, we present the results of our studies on the effects of other potential ferrocyanide waste constituents on the explosivity of mixtures of sodium nickel ferrocyanide and sodium nitrate and nitrite. In particular, this paper presents the results of investigations on the diluent effects of equimolar sodium nitrate and nitrite, sodium nickel ferrocyanide, and sodium aluminate, and the catalyst or initiator effects of nickel sulfide.

25745 (PNL-SA–21482) **Evaluating the technical aspects of mixed waste treatment technologies.** Bagaasen, L.M.; Scott, P.A. Pacific Northwest Lab., Richland, WA (United States). Oct 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9210297–1: Mixed waste regulation conference, Albuquerque, NM (United States), 26-27 Oct 1992). Order Number DE93007873. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses treatment of mixed wastes which is thought to be more complicated than treatment of either hazardous or radioactive wastes. In fact, the treatment itself is no more complicated: however, the regulations that define acceptability of the final waste disposal system are significantly more entangled, and sometimes in apparent conflict. This session explores the factors that influence the choice of waste treatment technologies, and expands on some of the limitations to their application. The objective of the presentation is to describe the technical factors that influence potential treatment processes and the ramifications associated with particular selections (for example, the generation of secondary waste streams). These collectively provide a framework for making informed treatment process selections.

25746 (PNL-SA–21716) **TWEAT: Ternary Waste Envelope Assessment Tool.** Robertus, R.J. (Pacific Northwest Lab., Richland, WA (United States)); Hrma, P.R.; Lambert, R. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930205–40: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93009325. Source: OSTI; NTIS; INIS; GPO Dep.

TWEAT is a graphical visualization software tool used to support activities at the Hanford Waste Vitrification Project. It requires the user to input the chemical composition of streams that will be mixed to produce glass, along with the property limits that the glass must meet. Using built-in property models, TWEAT then displays on a ternary diagram an "acceptable composition region" and a "qualified composition region" where glass can be produced. The "qualified composition region" is the most restrictive area. It meets all specified property limits and does not extrapolate any property models.

25747 (PNL-SA–21885) **Laboratory-scale vitrification and leaching of Hanford high-level waste for the purpose of simulant and glass property models validation.** Morrey, E.V.; Elliott, M.L.; Tingey, J.M. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930205–49: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93010168. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Waste Vitrification Plant (HWVP) is being built to process the high-level and TRU waste into canistered glass logs for disposal in a national repository. Testing programs have been established within the Project to verify process technology using simulated waste. A parallel testing program with actual radioactive waste is being performed to confirm the validity of using simulates and glass property models for waste form qualification and process testing. The first feed type to be processed by and the first to be tested on a laboratory-scale is pretreated neutralized current acid waste (NCAW). The NCAW is a neutralized high-level waste stream generated from the reprocessing of irradiated nuclear fuel in the Plutonium and Uranium Extraction (PUREX) Plant at Hanford. As part of the fuel reprocessing, the high-level waste generated in PUREX was denitrated with sugar to form current acid waste (CAW). Sodium hydroxide and sodium nitrite were added to the CAW to minimize corrosion in the tanks, thus yielding neutralized CAW. The NCAW contains small amounts of plutonium, fission products from the irradiated fuel, stainless steel corrosion products, and iron and sulfate from the ferrous sulfamate reductant used in the PUREX process. This paper will discuss the results and status of the laboratory-scale radioactive testing.

25748 (PNL-SA–22070) **UV and IR laser ablation for inductively coupled plasma mass spectrometry.** Smith, M.R.; Koppenaal, D.W.; Farmer, O.T. Pacific Northwest Lab., Richland, WA (United States). Jun 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9304144–9: 2. international conference on laser ablation: mechanisms and applications, Knoxville, TN (United States), 19-22 Apr 1993). Order Number DE93017124. Source: OSTI; NTIS; INIS; GPO Dep.

Laser ablation particle plume compositions are characterized using inductively coupled plasma mass spectrometry (ICP/MS). This study evaluates the mass response characteristics peculiar to ICP/MS detection as a function of laser fluence and frequency. Evaluation of the ICP/MS mass response allows deductions to be made concerning how representative the laser ablation produced particle plume composition is relative to the targeted sample. Using a black glass standard, elemental fractionation was observed, primarily for alkalis and other volatile elements. The extent of elemental fractionation between the target sample and the sampled plume varied significantly as a function of laser fluences and IR and UV laser frequency.

25749 (PNL-SA–22089) **The US Army HazMin probe model.** Kuusinen, T. (Pacific Northwest Lab., Richland, WA (United States)); Dirks, J.; Brothers, A.; Fowler, K.; Skumanich, M.; Scola, R.; Perich, A.; Napolitano, M. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 7p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930323–2: 19. environmental vision 2000: DOE/EPA/USCG - can current technology and resources get us there, Albuquerque, NM (United States), 23-27 Mar 1993). Order Number DE93012868. Source: OSTI; NTIS; INIS; GPO Dep.

In 1987, the US Department of Defense (DOD) established a goal of reducing the quantity of hazardous waste generated by DOD facilities by 50%. To help achieve this goal, the US Army Production Base Modernization Activity (PBMA) has contracted with the Pacific Northwest Laboratory (PNL) to develop decision support software to be used in the Army-wide hazardous waste minimization (HazMin) program. The resulting waste minimization prioritization software has been named the Project Opportunity and Benefit Evaluation (PROBE) model. PROBE can be used to evaluate both waste stream and project priorities. PROBE operates on any IBM-compatible personal computer hardware with at least 640K of memory and 5 megabytes of available hard disk space. PROBE was developed under the direction of PBMA, which retains unlimited rights to the Federal version of PROBE. PBMA encourages other DOD services and other Federal agencies to use PROBE to assist in their own waste minimization programs. PNL is also considering developing a copyrighted version of PROBE for

the commercial market. PROBE was written using FoxPro 2.0 application development software, and runs as an executable file from either MS-DOS or Windows. The software can be loaded onto a single high-capacity floppy disk in a compressed format and can be transferred onto hard disk, ready to operate, via a simple start-up routine.

25750 (PNL-SA–22322) **Effect of composition and temperature on viscosity and electrical conductivity of borosilicate glasses for Hanford nuclear waste immobilization.** Hrma, P.; Piepel, G.F.; Smith, D.E.; Redgate, P.E.; Schweiger, M.J. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930438–16: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93013505. Source: OSTI; NTIS; INIS; GPO Dep.

Viscosity and electrical conductivity of 79 simulated borosilicate glasses in the expected range of compositions to be produced in the Hanford Waste Vitrification Plant were measured within the temperature span from 950 to 1250°C. The nine major oxide components were SiO_2, B_2O_3, Li_2O, Na_2O, CaO, MgO, Fe_2O_3, Al_2O_3, and ZrO_2. The test compositions were generated statistically. The data were fitted by Fulcher and Arrhenius equations with temperature coefficients being multilinear functions of the mass fractions of the oxide components. Mixture models were also developed for the natural logarithm of viscosity and that of electrical conductivity at 1150°C. Least squares regression was used to obtain component coefficients for all the models.

25751 (PNL-SA–22687) **FY 1993 Ferrocyanide Tank Safety Project: Effects of Aging on Ferrocyanide Wastes test plan for the remainder of FY 1993.** Lilga, M.A.; Schiefelbein, G.F. Pacific Northwest Lab., Richland, WA (United States). Jun 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93017217. Source: OSTI; NTIS; INIS; GPO Dep.

Researchers in the Hanford Ferrocyanide Task Team are studying safety issues associated with ferrocyanide precipitates in single shell waste storage tanks (SST). Ferrocyanide is a stable complex of ferrous, ion and cyanide ion that is considered nontoxic because it does not dissociate readily in aqueous solutions. However, in the laboratory at temperatures in excess of 180°C and in the presence of oxidizers such as nitrates and nitrites, dry ferrocyanide and ferrocyanide waste stimulants can be made to react exothermically. The Ferrocyanide Safety Project at the Pacific Northwest Laboratory (PNL) is part of the Waste Tank Safety Program at Westinghouse Hanford Company (WHC). The purpose of the WHC program is to (1) maintain the ferrocyanide tanks with minimal risk of an accident, (2) select one or more strategies to assure safe storage, and (3) close out the unreviewed safety question (USQ). Tank ferrocyanide wastes were exposed to highly alkaline wastes from subsequent processing operations. Chemical reactions with caustic may have changed the ferrocyanide materials during 40 years of storage in the SSTs. Research in the "Effects of Aging on Ferrocyanide Wastes" task is targeted at studying aging of ferrocyanide tank simulants and other ferrocyanide materials to obtain a better understanding of how tank materials may have changed over the years. The research objective in this project is to determine the solubility and hydrolysis characteristics of simulated ferrocyanide tank wastes in alkaline media. The behavior of ferrocyanide simulant wastes is being determined by performing chemical reactions under conditions that might mimic the potential ranges in SST environments. Experiments are conducted at high pH, at high ionic strength, and in the presence of gamma radiation. Verification of simulant study findings by comparison with results with actual waste will also be required.

25752 (SAND–87-1305) **JAC3D – A three-dimensional finite element computer program for the nonlinear quasi-static response of solids with the conjugate gradient method: Yucca Mountain Site Characterization Project.** Biffle, J.H. Sandia National Labs., Albuquerque, NM (United States). Feb 1993. 132p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93015729. Source: OSTI; NTIS; INIS; GPO Dep.

JAC3D is a three-dimensional finite element program designed to solve quasi-static nonlinear mechanics problems. A set of continuum equations describes the nonlinear mechanics involving large rotation and strain. A nonlinear conjugate gradient method is used to solve the equation. The method is implemented in a three-dimensional setting with various methods for accelerating convergence. Sliding interface logic is also implemented. An eight-node Lagrangian uniform strain element is used with hourglass stiffness to control the zero-energy modes. This report documents the elastic and isothermal elastic-plastic material model. Other material models, documented elsewhere, are also available. The program is vectorized for efficient performance on Cray computers. Sample problems described are the bending of a thin beam, the rotation of a unit cube, and the pressurization and thermal loading of a hollow sphere.

25753 (SAND–92-1172) **Room Q data report: Test borehole data from April 1989 through November 1991.** Jensen, A.L. (Sandia National Labs., Albuquerque, NM (United States)); Howard, C.L.; Jones, R.L.; Peterson, T.P. Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 225p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93014407. Source: OSTI; NTIS; INIS; GPO Dep.

Pore-pressure and fluid-flow tests were performed in 15 boreholes drilled into the bedded evaporites of the Salado Formation from within the Waste Isolation Pilot Plant (WIPP). The tests measured fluid flow and pore pressure within the Salado. The boreholes were drilled into the previously undisturbed host rock around a proposed cylindrical test room, Room Q, located on the west side of the facility about 655 m below ground surface. The boreholes were about 23 m deep and ranged over 27.5 m of stratigraphy. They were completed and instrumented before excavation of Room Q. Tests were conducted in isolated zones at the end of each borehole. Three groups of 5 isolated zones extend above, below, and to the north of Room Q at increasing distances from the room axis. Measurements recorded before, during, and after the mining of the circular test room provided data about borehole closure, pressure, temperature, and brine seepage into the isolated zones. The effects of the circular excavation were recorded. This data report presents the data collected from the borehole test zones between April 25, 1989 and November 25, 1991. The report also describes test development, test equipment, and borehole drilling operations.

25754 (SAND–92-1173) **Large-scale brine inflow data report for room Q prior to November 25, 1991.** Jensen, A.L. (Sandia National Labs., Albuquerque, NM (United States)); Jones, R.L.; Lorusso, E.N.; Howard, C.L. Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 172p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013960. Source: OSTI; NTIS; INIS; GPO Dep.

A large-scale brine inflow test was conducted 655 m below ground surface in a cylindrical test room at the Waste Isolation Pilot Plant (WIPP). This test was the first large-scale WIPP test that allowed periodic access to a sealed, monitored excavation. The test was designed to characterize the environment within the sealed test room (Room Q) and to examine the surrounding host rock to quantify such characteristics as near-surface resistivity and permeability in the formation surrounding the room. Testing began with room boring in July 1989. Data in this report were collected from the time of test start-up through November 25, 1991. Relative humidity, barometric pressure, and temperature were measured in the sealed environment of the test room. Formation closure rates and electrical resistance of the formation close to the room surface were measured to determine the response of the host rock around Room Q. Brine was collected periodically to quantify the amount of inflow from large-scale openings. Results of the measurements are presented in a series of graphs. This report also describes the features of the test.

25755 (SAND–92-1777) **Commercial and research status report for inorganic membranes: Suggested uses in environmental and waste management processes.** Pohl, P.I. Sandia National Labs., Albuquerque, NM (United States). Apr 1993. 33p. Sponsored by USDOE, Washington, DC (United States). DOE

Contract AC04-76DP00789. Order Number DE93013897. Source: OSTI; NTIS; INIS; GPO Dep.

This document reports on a search of the literature regarding inorganic membrane technology for use in hazardous and radioactive waste treatment. The report lists and discusses DOE waste management separation needs where membranes could be used and describes inorganic membranes and the characteristics that may make them applicable for these separations. It may serve as a tool for making waste treatment design decisions and for weighing technical proposals in the area of separations.

25756 (SAND–92-2124C) **Gas barrier design for the WIPP.** Hansen, F.D. (Sandia National Labs., Albuquerque, NM (United States)); Leroch, M.J.; Van Sambeek, L.; Lin, M.S. Sandia National Labs., Albuquerque, NM (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930644–10: 34. US symposium on rock mechanics, Madison, WI (United States), 27-30 Jun 1993). Order Number DE93015026. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) near Carlsbad, New Mexico, is planned as the first mined repository for transuranic (TRU) wastes generated by defense programs of the United States Department of Energy (DOE). In coming years, tests with radioactive wastes are planned to be conducted at the WIPP. Potential tests include evaluation of gases generated by wastes emplaced in mined alcoves. Barriers must be installed in the entries to the test alcoves to limit gas release during testing. This paper discusses several rock mechanics issues involved in the design of an Alcove Gas Barrier (AGB) for use in these potential tests. The unique requirements placed on a gas barrier, when coupled with the geologic setting and strict regulations, make the AGB design challenging from several perspectives of rock mechanics. The AGB structure will be placed in the WIPP underground, which comprises a layered evaporite sequence of rock. A schematic of the design as it might appear in the WIPP underground is shown in Figure 1. The underlying requirement is that the AGB reduce gas leakage from a test alcove to an acceptable limit. The most likely route for gas leak-age is through a disturbed rock zone (DRZ), which develops in response to the excavation. Among other effects, the loading on the structure is a function of the geometrical arrangement and time, including considerations of installation and service life. Resolution of design issues also requires a defensible measure of conservatism. These considerations give rise to several issues in rock mechanics which are the emphases of this paper.

25757 (SAND–93-7022C) **Direct drilling related releases from the WIPP repository.** Berglund, J.W. (New Mexico Univ., Albuquerque, NM (United States). Engineering Research Inst.). Sandia National Labs., Albuquerque, NM (United States); New Mexico Univ., Albuquerque, NM (United States). Engineering Research Inst. [1993]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930906–7: '93 international conference on nuclear waste management and environmental remediation, Prague (Czech Republic), 5-11 Sep 1993). Order Number DE93011688. Source: OSTI; NTIS; INIS; GPO Dep.

Two processes are identified that can influence the quantity of wastes brought to the ground surface when a waste disposal room of the Waste Isolation Pilot Plant is inadvertently penetrated by an exploratory borehole. The first mechanism is that due to the erosion of the borehole wall adjacent to the waste caused by the flowing drilling fluid. The second concerns the borehole spall caused by the flow of waste-generated gas to the borehole. Available literature concerning both processes and a quantitative model for erosion are presented. Calculations are shown that confirm the importance of gas-induced spall but no definitive model is developed. It is concluded that constitutive data for decomposed waste must be developed and additional experiments performed to assess the full significance of this latter mechanism.

25758 (SKB-TR–92-33) **Finnsjoen study site. Scope of activities and main results.** Ahlbom, K. (Conterra AB, Uppsala (Sweden)); Andersson, J.E.; Andersson, Peter; Ittner, T.; Tiren, S.; Ljunggren, C. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Dec 1992. [155p.] Order Number DE93631590. Source: OSTI; NTIS; INIS.

The Finnsjoen study site was selected in 1977 to provide input to the KBS-1 and KBS-2 performance assessments. The site was later used as a test site for testing new instruments and new site characterization methods, as well as a research site for studying mainly groundwater flow and groundwater transport. All together, the Finnsjoen studies have involved 11 cored boreholes, down to max 700 m depth, and extensive borehole geophysical, geochemical and geohydraulic measurements, as well as rock stress measurements and tracer tests. This report presents the scope of the Finnsjoen studies together with main results. Conceptual uncertainties in assumptions and models are discussed with emphasis on the models used for the performance assessment SKB91. Of special interest for the Finnsjoen study site is the strong influence caused by a subhorizontal fracture zone on groundwater flow, transport and chemistry.

25759 (SKB-TR–92-35) **Calibration and validation of a stochastic continuum model using the Finnsjoen dipole tracer test. A contribution to INTRAVAL phase 2.** Kung Chen Shan (Royal Inst. of Technology, Stockholm (Sweden)); Cvetkovic, V.; Winberg, A. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Dec 1992. [70p.] Order Number DE93631591. Source: OSTI; NTIS; INIS.

A realistic semi-synthetic transmissivity field and dipole tracer test conditions similar the actual field test conditions at Finnsjoen were used to demonstrate a calibration and validation procedure applied to a stochastic continuum model. A validation strategy was set up to address whether a model calibrated and possibly validated on a local model scale, also is validated when extrapolated to a far-field scale. A generated 2D realization of the material property distribution on a far-field scale, honouring the measured single hole data and also recapturing the characteristics of the field dipole tracer test, was selected as an exhaustive reference field. The results of the simulated dipole tracer test on a local scale and of a far-field natural gradient tracer test were considered as reference field results. A large number (N=100) of conditioned parametric realizations of the studied domain were generated and the dipole tracer experiment was simulated for each realization. The porosity of the 2D aquifer model was used to calibrate the stochastic simulations on a local scale. An alternative calibration using a defined index of deviation was also applied. Subsequently, also the natural gradient tracer test was simulated on a far-field scale for the ensemble of realizations. It was found that the realizations which based on the defined index of deviation compared best with the local scale reference results did not recapture the characteristics of the reference far-field results. It was thus concluded that calibration/validation of a model on a local scale is insufficient for validating the model also an another large transport scale. In order to reduce the uncertainty in the far-field simulations more data on the corresponding transport are required. (20 refs.) (au).

25760 (UCRL-ID–111736) **An assessment of potential risk resulting from a maximum credible accident scenario at the proposed explosive waste storage facility (EWSF).** Otsuki, K.; Harrach, R.; Berger, R. Lawrence Livermore National Lab., CA (United States). Oct 1992. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93009445. Source: OSTI; NTIS; INIS; GPO Dep.

Lawrence Livermore National Laboratory (LLNL) proposes to build, permit, and operate a storage facility for explosive wastes at LLNL's Explosive Test Site, Site 300. The facility would consist of four existing magazines, four new magazettes (small concrete vaults), and a new prefabricated metal building. Ash from on-site treatment of explosive waste would also be stored in the prefabricated metal building prior to sampling analysis, and shipment. The magazettes would be installed at each magazine-and would provide segregated storage for explosive waste types including detonators, actuators, and other initiating devices. The proposed facility would be used to store explosive wastes generated by the Hydrotest and Explosive Development Programs at LLNL prior to treatment on-site or shipment to permitted, commercial, off-site treatment facilities. Explosive wastes to be stored in the proposed facility represent a full spectrum of Department of Energy (DOE)

and LLNL explosive wastes. This document identifies and evaluates the risk to human health and the environment associated with the operation of the proposed EWSF.

25761 (UCRL-JC–108635) **Analysis of chromium volatility in the DWTF incinerator and in the molten salt processor.** Ebbinghaus, B.B. Lawrence Livermore National Lab., CA (United States). 2 Apr 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93009251. Source: OSTI; NTIS; INIS; GPO Dep.

Thermodynamic methods have been applied to calculate the volatility of chromium both in atmospheres and in milligrams per cubic meter (stp) of offgas for the decontamination and waste treatment facility (DWTF) incinerator and the Rockwell molten salt processor. The known chromium species which have relatively high stabilities under oxidizing conditions and which contain elements found in either the DWTF incinerator or the molten salt processor are $CrO_2(OH)_2(g)$, $CrO_2OH(g)$, $CrO_3(g)$, $CrO_2Cl_2(g)$, and $CrOF(g)$ and $CrO_2F_2(g)$. This study demonstrates that these species as well as others such as $CrO(OH)_2(g)$, $CrOOH(g)$, $CrO(OH)_3(g)$, $CrO_2Cl(g)$, $CrOC1_2(g)$, $CrOCl(g)$, $CrOC1_3(g)$, $CrOC1_4(g)$, and $CrO_2F(g)$ can all be important species which contribute to the overall volatility of chromium in waste oxidation processes.

25762 (UCRL-JC–112711) **Experimental studies of actinide volatilities with application to mixed waste oxidation processors.** Krikorian, O.H.; Ebbinghaus, B.B.; Condit, R.H.; Adamson, M.G.; Fontes, A.S. Jr.; Fleming, D.L. Lawrence Livermore National Lab., CA (United States). 30 Apr 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930572–6: 12. annual international symposium on thermal treatment technologies - incineration conference, Knoxville, TN (United States), 3-7 May 1993). Order Number DE93014430. Source: OSTI; NTIS; GPO Dep.

The transpiration technique is used to measure volatilities of U from $U_3O_8(s)$, Pu from $PuO_2(s)$ and Pu and Am from PuO_2/ $2\%AmO_2(s)$ in the presence of steam and oxygen at temperatures ranging from 900 to 1300°C.

25763 (UCRL-JC–113268) **Partitioning and transmutation: Near-term solution or long-term option?.** Ramspott, L.D. (Lawrence Livermore National Lab., CA (US)); Isaacs, T. Lawrence Livermore National Lab., CA (United States). 25 Feb 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930205–78: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93016540. Source: OSTI; NTIS; INIS; GPO Dep.

Starting in 1989, the concept that partitioning and transmuting actinides from spent nuclear fuel could be a "solution" to the apparent lack of progress in the high-level waste disposal program began to be heard from a variety of sources, both in the US and internationally. There have been numerous papers and sessions at scientific conferences and several conferences devoted to this subject in the last three years. At the request of the US Department of Energy, the National Research Council is evaluating the feasibility of this concept. Because either plutonium or highly enriched uranium is needed to startup breeder reactors, there is a sound rationale for using Pu from reprocessing spent light-water reactor fuel to start a conversion to Pu-breeding liquid metal reactors (LMRs), once society makes the determination that adding a large component of LMRs to the electricity-generating grid is desirable. This is the long-term option referred to in the title. It is compatible with the current and likely future high-level waste program, as well as the current nuclear power industry in the US. However, the thesis of this paper is that partitioning and transmutation (P-T) does not offer a near term solution to high-level waste disposal in the US for numerous reasons, the most important of which is that a repository will be needed even with P-T. Other important reasons include: (1) lack of evidence that the public will be more likely to accept a repository that has a reduced inventory, (2) the waste disposal program delays do not result from technical evidence of lack of safety, (3) the economics of reprocessing and/or P-T are unfavorable, and (4) obtaining the benefits from P-T requires a long-term commitment to nuclear power.

25764 (UCRL-LR–107476-Vol.1) **Preliminary near-field environment report: Volume 1, Technical bases for EBS design.** Wilder, D.G. Lawrence Livermore National Lab., CA (United States). Apr 1993. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014854. Source: OSTI; NTIS; INIS; GPO Dep.

The United States Department of Energy (DOE) is investigating the suitability of Yucca Mountain as a potential site for the nation's first high-level nuclear waste repository. The site is located about 120 km northwest of Las Vegas, Nevada, in an area of uninhabited desert (Fig. 1). Lawrence Livermore National Laboratory (LLNL) is a Yucca Mountain Site Characterization Project (YMP) participant and is responsible for the development of waste package (WP) and engineered barrier system (EBS) design concepts, including materials testing and selection, design criteria development, waste-form characterization, performance assessments, and near-field environment (NFE) characterization.

25765 (WHC-EP–0182-55) **Tank farm surveillance and waste status summary report for October 1992.** Hanlon, B.M. Westinghouse Hanford Co., Richland, WA (United States). Jan 1993. 119p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93014633. Source: OSTI; NTIS; INIS; GPO Dep.

This report is the official inventory for radioactive waste stored in underground tanks in the 200 Areas at the Hanford Site. Data that depict the status of stored radioactive waste and tank vessel integrity are contained within the report. This report provides data on each of the existing 177 large underground waste storage tanks and 49 smaller catch tanks and special surveillance facilities, and supplemental information regarding tank surveillance anomalies and ongoing investigations. This report is intended to meet the requirement of US Department of Energy-Richland Operations Office Order 5820.2A, Chapter 1, Section 3.e. (3) (DOE-RL, 1990, Radioactive Waste Management, US Department of Energy-Richland Operation Office, Richland, Washington) requiring the reporting of waste inventories and space utilization for Hanford Tank Farm Tanks.

25766 (WHC-EP–0182-56) **Tank farm surveillance and waste status summary report for November 1992.** Hanlon, B.M. Westinghouse Hanford Co., Richland, WA (United States). Feb 1993. 120p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93014504. Source: OSTI; NTIS; INIS; GPO Dep.

Order 5820.2A, Chapter I, Section 3.e. (3) (DOE-RL, 1990, Radioactive Waste Management, US Department of Energy-Richland Operation Office, Richland, Washington) requiring the reporting of waste inventories and space utilization for Hanford Tank Farm Tanks.

25768 (WHC-EP–0461) **Action plan for responses to abnormal conditions in Hanford Site radioactive waste tanks with high organic content.** Turner, D.A. Westinghouse Hanford Co., Richland, WA (United States). Feb 1993. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93014487. Source: OSTI; NTIS; INIS; GPO Dep.

This action plan describes the criteria and the organizational responsibilities required for ensuring that waste tanks with high organic content are maintained in a safe condition at the Hanford Site. Additionally, response actions for prevention or mitigation of excessive temperature or a material release from any waste tank with high organic content have been outlined. Other response actions may be defined by Westinghouse Hanford Company Systems Engineering if a waste tank parameter goes out of specification. Trend analysis indicates the tank parameters have seasonal variation but are otherwise stable.

25769 (WHC-EP–0466-1-Rev.1) **Facility effluent monitoring plan for 242-A Evaporator facility: Revision 1.** Crummel, G.M.; Gustavson, R.D. Westinghouse Hanford Co., Richland, WA (United States). Mar 1993. 275p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93014623. Source: OSTI; NTIS; INIS; GPO Dep.

A facility effluent monitoring plan is required by the US Department of Energy in DOE Order 5400.1* for any operations that involve hazardous materials and radioactive substances that could affect employee or public safety or the environment. A facility effluent monitoring plan determination was performed during Calendar Year 1991 and the evaluation showed the need for a facility effluent monitoring plan. This document is prepared using the specific guidelines identified in A Guide for Preparing Hanford Site Facility effluent Monitoring Plans, WHC-EP-0438-1**. This facility effluent monitoring plan assesses effluent monitoring systems and evaluates whether they are adequate to ensure the public health and safety as specified in applicable federal, state, and local requirements.

25770 (WHC-EP–0474-7) **Quarterly report on Defense Nuclear Facilities Safety Board Recommendation 90-7 for the period ending December 31, 1992.** Cash, R.J.; Dukelow, G.T.; Forbes, C.J. Westinghouse Hanford Co., Richland, WA (United States). Mar 1993. 115p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93014631. Source: OSTI; NTIS; GPO Dep.

This is the seventh quarterly report on the progress of activities addressing safety issues associated with Hanford Site high-level radioactive waste tanks that contain ferrocyanide compounds. In the presence of oxidizing materials, such as nitrates or nitrites, ferrocyanide can be made to explode in the laboratory by heating it to high temperatures [above 285°C (545°F)]. In the mid 1950s approximately 140 metric tons of ferrocyanide were added to 24 underground high-level radioactive waste tanks. An implementation plan (Cash 1991) responding to the Defense Nuclear Facilities Safety Board Recommendation 90-7 (FR 1990) was issued in March 1991 describing the activities that were planned and underway to address each of the six parts of Recommendation 90-7. A revision to the original plan was transmitted to US Department of Energy by Westinghouse Hanford Company in December 1992. Milestones completed this quarter are described in this report. Contents of this report include: Introduction; Defense Nuclear Facilities Safety Board Implementation Plan Task Activities (Defense Nuclear Facilities Safety Board Recommendation for enhanced temperature measurement, Recommendation for continuous temperature monitoring, Recommendation for cover gas monitoring, Recommendation for ferrocyanide waste characterization, Recommendation for chemical reaction studies, and Recommendation for emergency response planning); Schedules; and References. All actions recommended by the Defense Nuclear Facilities Safety Board for emergency planning by Hanford Site emergency preparedness organizations have been completed.

25771 (WHC-EP–0532) **High heat tank safety issue resolution program plan.** DeFigh-Price, C.; Wang, O.S. Westinghouse Hanford Co., Richland, WA (United States). Feb 1993. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93014489. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this program plan is to provide a guide for selecting corrective actions that with mitigate and/or resolve the single-shell tank 241-C-106 high-heat tank safety issue. This program plan also outlines the steps necessary to implement corrective actions. The postulated hazard for the high-heat tank safety issue involves the release of nuclear waste to the environment as the result of heat-induced structural damage to the tank's concrete, should forced cooling be interrupted for extended periods. The heat generation originates from the radioactive decay of waste material (primarily ^{90}Sr) that was inadvertently transferred into the tank in the late 1960s. Cooling to prevent waste temperatures in excess of the 300°F operating limit is currently accomplished by evaporative cooling through active filtered altered ventilation. This is supported by periodic water additions to maintain a liquid cover over the sludge, and for enhanced thermal conductivity for heat transfer.

25772 (WHC-EP–0569-Rev.1) **Long-term climate change assessment study plan for the Hanford Site Permanent Isolation Barrier Development Program: Revision 1.** Petersen, K.L. (Westinghouse Hanford Co., Richland, WA (United States)); Chatters, J.C.; Waugh, W.J. Westinghouse Hanford Co., Richland, WA (United States). May 1993. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (PNL–8359). Order Number DE93014836. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Site Permanent Isolation Barrier Development Program (Barrier Development Program) was organized to develop the technology needed to provide an in-place disposal capability for low-level nuclear waste for the US Department of Energy at the Hanford Site in south-central Washington. The goal of the Barrier Development Program is to provide defensible evidence that final barrier design(s) will adequately control water infiltration, plant and animal intrusion, and wind and water erosion for a minimum of 1,000 yr; to isolate wastes from the accessible environment; and to use markers to warn inadvertent human intruders. Evidence for barrier performance will be obtained by conducting laboratory experiments, field tests, computer modeling, and other studies that establish confidence in the barrier's ability to meet its 1,000-yr design life.

25773 (WHC-EP–0576) **Assessment of gas accumulation and retention – Tank 241-SY-101.** Alleman, R.T. (Pacific Northwest Lab., Richland, WA (US)); Burke, T.M.; Reynolds, D.A.; Simpson, D.E. Westinghouse Hanford Co., Richland, WA (United States). Mar 1993. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93014503. Source: OSTI; NTIS; INIS; GPO Dep.

An approximate analysis has been carried out to assess and estimate the maximum quantity of gas that is likely to be accumulated within waste tank 241-SY-101, and the maximum quantity which is likely to be retained after gas release events (GRE). According to the phenomenological models used for this assessment, based on interpretation of current and recent operational data, the estimated gas generation rate in the tank is approximately 4 m^3/day (147 ft^3/day). About half of this gas is released as it is generated, which is (essentially) continuously. The remainder is accumulated within the slurry layer of settled solids at the bottom of the tank, and released episodically in GREs, known as "burps," that are induced by unstable buoyant conditions which develop when sufficient gas accumulates in the slurry. Calculations based on gas volumes to cause neutral buoyancy in the slurry predict the following: the maximum gas accumulation (at 1 atm pressure) that can occur without triggering a GRE is in the range of 606 to 1,039 m^3 (21,400 to 36,700 ft^3); and the maximum gas retention immediately after a GRE is equal to the maximum accumulation minus the gas released in the GRE. GREs do not necessarily involve all of the slurry. In the largest GREs, which are assumed to involve all of

the slurry, the minimum gas release (at 1 atm pressure) is calculated to be in the range of 193 to 328 m^3 (6,800 to 11,600 ft^3). The corresponding maximum gas retention would be 413 to 711 m^3 (14,600 to 25,100 ft^3).

25774 (WHC-EP–0621) **Characterization of past and present solid waste streams from the plutonium finishing plant.** Duncan, D.R. (Westinghouse Hanford Co., Richland, WA (United States)); Mayancsik, B.A.; Pottmeyer, J.A.; Vejvoda, E.J.; Reddick, J.A.; Sheldon, K.M.; Weyns, M.I. Westinghouse Hanford Co., Richland, WA (United States). Feb 1993. 487p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93014186. Source: OSTI; NTIS; INIS; GPO Dep.

During the next two decades the transuranic (TRU) wastes now stored in the burial trenches and storage facilities at the Hanford Site are to be retrieved, processed at the Waste Receiving and Processing (WRAP) Facility, and shipped to the Waste Isolation Pilot Plant (WIPP) near Carlsbad, New Mexico for final disposal. Over 50% of the TRU waste to be retrieved for shipment to the WIPP has been generated at the Plutonium Finishing Plant (PFP), also known as the Plutonium Processing and Storage Facility and Z Plant. The purpose of this report is to characterize the radioactive solid wastes generated by the PFP since its construction in 1947 using process knowledge, existing records, and history-obtained from interviews. The PFP is currently operated by Westinghouse Hanford Company (WHC) for the US Department of Energy (DOE).

25775 (WHC-EP–0628) **Tank 101-SY Window E core sample: Interpretation of results.** Reynolds, D.A. Westinghouse Hanford Co., Richland, WA (United States). Feb 1993. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93014486. Source: OSTI; NTIS; INIS; GPO Dep.

A full depth core sample was taken for tank 241-SY-101 in December 1991 during a time period called "Window E." This was the second full depth core sample from this tank during the year. The core had two major portions that are known as the convective zone and the nonconvective zone. A crust was on the top of tank but as poorly sampled. The analysis of the Window E core sample stressed segment composite chemical analysis instead of segment by segment as in Window C. Adiabatic calorimetry on samples from both cores showed a slow self heating reaction above 150°C on dried samples. The exothermic events were milder than similar synthetic samples. The chemical and physical properties complemented the information from Window C. The Window E material from the convective zone was more viscous than the Window C convective zone material. The nonconvective zone viscosities were similar for both cores. Heating and dilution tests were made to test mitigation concepts.

25776 (WHC-EP–0631) **Ferrocyanide waste simulant characterization.** Jeppson, D.W.; Wong, J.J. Westinghouse Hanford Co., Richland, WA (United States). Jan 1993. 403p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93014616. Source: OSTI; NTIS; INIS; GPO Dep.

Ferrocyanide waste simulants were prepared and characterized to help assess safety concerns associated with the ferrocyanide sludges stored in underground single-shell waste tanks at the Hanford Site. Simulants were prepared to represent the variety of ferrocyanide sludges stored in the storage tanks. Physical properties, chemical compositions, and thermodynamic properties of the simulants were determined. The simulants, as produced, were shown to not sustain propagating reactions when subjected to a strong ignition source. Additional testing and evaluations are recommended to assess safety concerns associated with postulated ferrocyanide sludge dry-out and exposure to external ignition sources.

25777 (WHC-EP–0635) **Assay development status report for total cyanide.** Simpson, B.C. (Westinghouse Hanford Co., Richland, WA (United States)); Jones, T.E.; Pool, K.H. Westinghouse Hanford Co., Richland, WA (United States). Feb 1993. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93014628. Source: OSTI; NTIS; INIS; GPO Dep.

A validated cyanide assay that is applicable to a variety of tank waste matrices is necessary to resolve certain waste tank safety issues and for purposes of overall waste characterization. The target for this effort is an assay with an applicable range of greater than 1,000 ppM (0.10 wt%) total cyanide and a confidence level greater than 80%. Figure 1 illustrates the operating regime of the proposed cyanide assay method. The Assay Development Status Report for Total Cyanide will summarize the past experience with cyanide analyses on-tank waste matrices and will rate the status of the analytical methods used to assay total cyanide (CN^- ion) in the tank waste matrices as acceptable or unacceptable. This paper will also briefly describe the current efforts for improving analytical resolution of the assays and the attempts at speciation.

25778 (WHC-EP–0646) **Characterization of past and present solid waste streams from the Plutonium-Uranium Extraction Plant.** Pottmeyer, J.A. (Los Alamos Technical Associates, Inc., NM (US)); Weyns, M.I.; Lorenzo, D.S.; Vejvoda, E.J.; Duncan, D.R. Westinghouse Hanford Co., Richland, WA (United States). Apr 1993. 436p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93016829. Source: OSTI; NTIS; INIS; GPO Dep.

During the next two decades the transuranic wastes, now stored in the burial trenches and storage facilities at the Hanford Site, are to be retrieved, processed at the Waste Receiving and Processing Facility, and shipped to the Waste Isolation Pilot Plant near Carlsbad, New Mexico for final disposal. Over 7% of the transuranic waste to be retrieved for shipment to the Waste Isolation Pilot Plant has been generated at the Plutonium-Uranium Extraction (PUREX) Plant. The purpose of this report is to characterize the radioactive solid wastes generated by PUREX using process knowledge, existing records, and oral history interviews. The PUREX Plant is currently operated by the Westinghouse Hanford Company for the US Department of Energy and is now in standby status while being prepared for permanent shutdown. The PUREX Plant is a collection of facilities that has been used primarily to separate plutonium for nuclear weapons from spent fuel that had been irradiated in the Hanford Site's defense reactors. Originally designed to reprocess aluminum-clad uranium fuel, the plant was modified to reprocess zirconium alloy clad fuel elements from the Hanford Site's N Reactor. PUREX has provided plutonium for research reactor development, safety programs, and defense. In addition, the PUREX was used to recover slightly enriched uranium for recycling into fuel for use in reactors that generate electricity and plutonium. Section 2.0 provides further details of the PUREX's physical plant and its operations. The PUREX Plant functions that generate solid waste are as follows: processing operations, laboratory analyses and supporting activities. The types and estimated quantities of waste resulting from these activities are discussed in detail.

25779 (WHC-EP–0648) **Ferrocyanide safety program: Credibility of drying out ferrocyanide tank waste by hot spots.** Dickinson, D.R.; McLaren, J.M.; Borsheim, G.L.; Crippen, M.D. Westinghouse Hanford Co., Richland, WA (United States). Apr 1993. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93014619. Source: OSTI; NTIS; INIS; GPO Dep.

The single-shell waste tanks at the Hanford Site that contain significant quantities of ferrocyanide have been considered a possible hazard, since under certain conditions the ferrocyanide in the waste tanks could undergo an exothermic chemical reaction with the nitrates and nitrites that are also present in the tanks. The purpose of this report is to assess the credibility of local dryout of ferrocyanide due to a hotspot. This report considers the following: What amount of decay heat generation within what volume would be necessary to raise the temperature of the liquid in the sludge to its boiling point? What mechanisms could produce a significant local concentration of heat sources? Is it credible that a waste tank heat concentration could be as large as that required to reach the dryout temperatures? This report also provides a recommendation as to whether infrared scanning of the ferrocyanide tanks is needed. From the analyses presented in this report it is evident that formation of dry, and thus chemically reactive, regions in the ferrocyanide

sludge by local hotspots is not credible. This conclusion is subject to reevaluation if future analyses of tank core samples show much higher ^{137}Cs or ^{90}Sr concentrations than expected. Since hotspots of concern are not credible, infrared scanning to detect such hotspots is not required for safe storage of tank waste.

25780 (WHC-EP–0655-Draft) **Parametric study of radionuclide characterization – Low-level waste: Draft.** Amir, S.J. Westinghouse Hanford Co., Richland, WA (United States). Apr 1993. 88p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93014140. Source: OSTI; NTIS; INIS; GPO Dep.

The criteria and guidance given in this addendum specifically address the classification of low-level waste at the Hanford Reservation into Category 1, Category 3, and Greater Than Category 3 (GTC3). These categories are developed based on the performance assessment (PA) being conducted for the Hanford Site. The radionuclides and their concentration for each category are listed in the revised Table 1-1 (Attachment 1). The information to classify the waste for US Department of Transportation (DOT) and to classify Transuranic (TRU)/Non-TRU, Contact Handled (CH)/Remote Handled (RH) waste is given in WHC-EP-0063-3 (WHC 1991).

25781 (WHC-EP–0658) **Moisture monitoring of ferrocyanide tanks: An evaluation of methods and tools.** Meacham, J.E.; Babad, H.; Toffer, H. Westinghouse Hanford Co., Richland, WA (United States). Apr 1993. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93014634. Source: OSTI; NTIS; INIS; GPO Dep.

This report reviews the strengths and limitations of moisture monitoring technologies that could be used for determining moisture concentration in Hanford Site single-shell ferrocyanide waste tanks. Two technologies (neutron diffusion and near-infrared spectroscopy) are being pursued as part of the ferrocyanide program. A third technology, Raman spectroscopy, is in development as a speciation tool at the Westinghouse Hanford Company 222-S Laboratory. The potential application of Raman spectroscopy to moisture monitoring is discussed.

25782 (WHC-EP–0659) **Characterization of past and present solid waste streams from 231-Z.** Pottmeyer, J.A. (Los Alamos Technical Associates, Inc., NM (US)); DeLorenzo, D.S.; Weyns-Rollosson, M.I.; Berkwitz, D.E.; Vejvoda, E.J.; Duncan, D.R. Westinghouse Hanford Co., Richland, WA (United States). Jun 1993. 191p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93016826. Source: OSTI; NTIS; INIS; GPO Dep.

During the next two decades the transuranic (TRU) wastes now stored in the burial trenches and storage facilities at the Hanford Site are to be retrieved, processed at the Waste Receiving and Processing Facility, and shipped to the Waste Isolation Pilot Plant near Carlsbad, New Mexico for final disposal. Over 8% of the TRU waste to be retrieved for shipment to the Waste Isolation Pilot Plant has been generated at the Plutonium Metallurgy Laboratory (231-Z) Facility. The purpose of this report is to characterize the radioactive solid wastes generated by 231-Z using process knowledge, existing records and oral history interviews. Since 1944 research and development programs utilizing plutonium have been conducted at 231-Z in the fields of physical metallurgy, property determination, alloy development, and process development. The following are sources of solid waste generation at the 231-Z Facility: (1) General Weapons Development Program, (2) process waste from gloveboxes, (3) numerous classified research and development programs, (4) advanced decontamination and decommissioning technologies, including sectioning, vibratory finishing, electropolishing, solution process, and small bench-scale work, (5) general laboratory procedures, (6) foundry area, (7) housekeeping activities, and (8) four cleanout campaigns. All solid wastes originating at 231-Z were packaged for onsite-offsite storage or disposal. Waste packaging and reporting requirements have undergone significant changes throughout the history of 231-Z. Current and historical procedures are provided in Section 4.0. Information on the radioactive wastes generated at 231-Z can be found in a number of documents and databases, most importantly the Solid Waste Information and Tracking System database and Solid Waste Burial Records. Facility personnel also provide excellent information about past waste generation and the procedures used to handle that waste. Section 5.0 was compiled using these sources.

25783 (WHC-SA–1423) **Managing Hanford Site solid waste through strict acceptance criteria.** Jasen, W.G.; Pierce, R.D.; Willis, N.P. Westinghouse Hanford Co., Richland, WA (United States). Feb 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930205–65: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93014190. Source: OSTI; NTIS; INIS; GPO Dep.

Various types of waste have been generated during the 50-year history of the Hanford Site. Regulatory changes in the last 20 years have provided the emphasis for better management of these wastes. Interpretations of the Atomic Energy Act of 1954 (AEA) and the Resource Conservation and Recovery Act of 1976 (RCRA) have led to the definition of a group of wastes called radioactive mixed wastes (RMW). As a result of the radioactive and hazardous properties of these wastes, strict management programs have been implemented for the management of these wastes. Solid waste management is accomplished through a systems performance approach to waste management that used best-demonstrated available technology (BDAT) and best management practices. The solid waste program at the Hanford Site strives to integrate all aspects of management relative to the treatment, storage and disposal (TSD) of solid waste. Often there are many competing and important needs. It is a difficult task to balance these needs in a manner that is both equitable and productive. Management science is used to help the process of making decisions. Tools used to support the decision making process include five-year planning, cost estimating, resource allocation, performance assessment, waste volume forecasts, input/output models, and waste acceptance criteria. The purpose of this document is to describe how one of these tools, waste acceptance criteria, has helped the Hanford Site manage solid wastes.

25784 (WHC-SA–1551) **Nondestructive assay of boxed radioactive waste.** Gilles, W.P.; Roberts, R.J.; Jasen, W.G. Westinghouse Hanford Co., Richland, WA (United States). Dec 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930906–6: '93 international conference on nuclear waste management and environmental remediation, Prague (Czech Republic), 5-11 Sep 1993). Order Number DE93009430. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the problems related to the nondestructive assay (NDA) of boxed radioactive waste at the Hanford Site and how Westinghouse Hanford company (WHC) is solving the problems. The waste form and radionuclide content are described. The characteristics of the combined neutron and gamma-based measurement system are described.

25785 (WHC-SA–1608) **Radioactive mixed waste disposal.** Jasen, W.G.; Erpenbeck, E.G. Westinghouse Hanford Co., Richland, WA (United States). Feb 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930906–4: '93 international conference on nuclear waste management and environmental remediation, Prague (Czech Republic), 5-11 Sep 1993). Order Number DE93009425. Source: OSTI; NTIS; INIS; GPO Dep.

Various types of waste have been generated during the 50-year history of the Hanford Site. Regulatory changes in the last 20 years have provided the emphasis for better management of these wastes. Interpretations of the Atomic Energy Act of 1954 (AEA), the Resource Conservation and Recovery Act of 1976 (RCRA), and the Hazardous and Solid Waste Amendments (HSWA) have led to the definition of radioactive mixed wastes (RMW). The radioactive and hazardous properties of these wastes have resulted in the initiation of special projects for the management of these wastes. Other solid wastes at the Hanford Site include low-level wastes, transuranic (TRU), and nonradioactive hazardous wastes. This paper describes a system for the treatment, storage, and disposal (TSD) of solid radioactive waste.

25786 (WHC-SA–1609) **Mobile inspection and repackaging unit.** Whitney, G.A.; Roberts, R.J. Westinghouse Hanford Co.,

Richland, WA (United States). Dec 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930906–5: '93 international conference on nuclear waste management and environmental remediation, Prague (Czech Republic), 5-11 Sep 1993). Order Number DE93009431. Source: OSTI; NTIS; INIS; GPO Dep.

Storage of large volumes of radioactive mixed waste (RMW) and transuranic waste generated over the past 20 years at the Hanford Site has resulted in various waste management challenges. Presently disposal capacity for this waste type does not exist. The waste wail be stored until processing facilities can be completed to provide treatment and final disposed. Because of the complexity of these wastes, special projects have been initiated to properly manage them. This paper addresses one such project. The goal of this project is to develop a mobile solid waste inspection and repackaging facility for solid RMW and transuranic waste.

25787 (WHC-SA–1623) **Vadose zone characterization of highly radioactive contaminated soil at the Hanford Site.** Buckmaster, M.A. Westinghouse Hanford Co., Richland, WA (United States). May 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930906–10: '93 international conference on nuclear waste management and environmental remediation, Prague (Czech Republic), 5-11 Sep 1993). Order Number DE93014916. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Site in south-central Washington State contains over 1500 identified waste sites and numerous groundwater plumes that will be characterized and remediated over the next 30 years. As a result of the Hanford Federal Facility Agreement and Consent Order, the US Department of Energy has initiated a remedial investigation/feasibility study at the 200-BP-1 operable unit. The 200-BP-1 remedial investigation is the first Comprehensive Environmental Response, Compensation, and Liability Act of 1980 investigation on the Hanford Site that involves drilling into highly radioactive and chemically contaminated soils. The initial phase of site characterization was designed to assess the nature and extent of contamination associated with the source waste site within the 200-BP-1 operable unit. Characterization activities consisted of drilling and sampling the waste site, chemical and physical analysis of samples, and development of a conceptual vadose zone model. Predicted modeling concentrations compared favorably to analytical data collected during the initial characterization activities.

25788 (WHC-SA–1630) **In situ electrochemical characterization of grouted radioactive waste.** Gu, Jingyan (Brooklyn Coll., NY (United States). Dept. of Physics); Shen, Wu-Mian; Tomkiewicz, Micha; Kruger, A.A. Westinghouse Hanford Co., Richland, WA (United States). Apr 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930906–9: '93 international conference on nuclear waste management and environmental remediation, Prague (Czech Republic), 5-11 Sep 1993). Order Number DE93014505. Source: OSTI; NTIS; INIS; GPO Dep.

At the Hanford Site, twenty-eight double-shell tanks (DST) and one hundred and forty nine single-shell tanks (SST) are used for storage of radioactive liquid and sludge wastes and sat cake. A fundamental goal of the Westinghouse Hanford Company is to end the current storage practice for liquid wastes and to permanently dispose of the waste. The Hanford Defense Waste Environmental Impact Statement and subsequent record of decision has identified a cement-based waste form for disposal of DST low-level liquid waste. The low level radioactive fractions of these wastes will be immobilized in a cementitious grout at the Hanford Grout Processing Facility and disposed of in concrete vaults of the Grout Disposal Facility. Prior to closing each vault, postcuring verification will show that the final product meets the performance requirements. Any long term disposal system of radioactive waste will require monitoring to warn against structural deterioration and/or leach of the radioactive or hazardous components into the environment. We are investigating the possibility of monitoring the degree of immobilization of the waste by embedding a grid of long-lasting electrodes in grout. This work describes our ongoing attempts to understand the physics and chemistry of charge carriers in the grout under various load conditions.

25789 (WHC-SA–1637) **FT-IR analyses of the oxidative decomposition products of cyanoferrate wastes.** Rebagay, T.V.; Dodd, D.A.; Colby, S.A. Westinghouse Hanford Co., Richland, WA (United States). Mar 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930313–2: 44. Pittsburgh conference and exposition on analytical chemistry and applied spectroscopy, Atlanta, GA (United States), 8-12 Mar 1993). Order Number DE93014589. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Site (Fig. 1) near Richland, Washington, operated by the US Department of Energy, Richland Field Office, had produced nuclear materials for the nation's defense programs for more than 50 years. The radioactive liquid waste resulting from the processing of irradiated nuclear materials is stored temporarily in single-shell carbon steel tanks (Fig. 2) at the Site. The tanks are buried underground in tank farms with several feet of soil cover above the tank closure (Fig. 3). As part of a program to conserve tank space in the 1950s', a precipitation process was developed to scavenge radioactive cesium from the waste supernates. Ferrocyanide was added to the radioactive wastes and cesium-depleted supernates were discharged into cribs. Hexacyanoferrates [$Fe(CN)_6^{3-}$ and $Fe(CN_6^{4-}$] are generally considered to be extraordinarily stable and even called-kinetically inert. However, recent 2 safety concerns have focused on the stability of cyanoferrate-bearing tanks containing large quantities of nitrates and nitrites. One strategy to resolve this concern involves oxidative decomposition of the cyanoferrates with common oxidants such as ozone (O_3) and hydrogen peroxide. This paper describes the results of the initial studies on the treatment of simulated cyanoferrate wastes with ozone and ozone-hydrogen peroxide mixtures. The oxidative decomposition products were analyzed by a Fourier transform infrared spectroscopic method.

25790 (WHC-SA–1661) **A strategy for resolving high-priority Hanford Site radioactive waste storage tank safety issues.** Babad, H.; DeFigh-Price, C.; Fulton, J.C. Westinghouse Hanford Co., Richland, WA (United States). Feb 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930205–72: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93014626. Source: OSTI; NTIS; INIS; GPO Dep.

High-activity radioactive waste has been stored in large underground storage tanks at the US Department of Energy's (DOE) Hanford Site in Eastern Washington State since 1944. Since then, more than 227,000 m^3 (60 Mgal) of waste have been accumulated in 177 tanks. These caustic wastes consist of many different chemicals. The waste forms include liquids, slurries, salt cakes, and sludges. A number of safety issues have been raised about these wastes, and resolution of these issues is a top priority of DOE. A Waste Tank Safety Program has been established to resolve these high-priority safety issues. This paper will deal with three of these issues. The issues described are the release of flammable vapors from single- and double-shell tanks, the existence of organic chemicals, and/or ferrocyanide ion-containing fuel-rich mixtures of nitrate and nitrite salts in single-shell tanks.

25791 (WHC-SA–1671) **Resolving the safety issue for radioactive waste tanks with high organic content.** Babad, H. (Westinghouse Hanford Co., Richland, WA (United States)); Crippen, M.D.; Turner, D.A.; Gerber, M.A. Westinghouse Hanford Co., Richland, WA (United States). Feb 1993. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930205–71: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93014627. Source: OSTI; NTIS; INIS; GPO Dep.

An overview of the Waste Tank Safety Organic Program is provided. The overview discusses the history of the wastes containing high concentrations of organics, existing safety criteria associated with those tanks, and details of thermodynamic studies by Westinghouse Hanford Company bounding potential reactivity. The program to be discussed contains the elements of the collection and analysis of tank historical information; reevaluation of organic tank-listing criteria; the performance of detailed studies on simulated waste; completion of waste characterization for each affected tank; and, as part of issue closure, the preparation of short-term and long-term

safety and risk assessments based on results from characterization and the waste simulant studies. This document reports on a number of simplified thermodynamic calculations that were performed to ascertain combustion limits for simple surrogates of organic materials in a nitrate-nitrite containing alkaline waste. For expected waste species, the results of these calculations indicate that the range of reactivity encompasses energies that vary only by a factor of three over the range of normal paraffin hydrocarbon (NPH) (a fuel rich solvent) to sodium oxalate (a degradation product resulting from in situ organic complexant destruction in Hanford Site wastes).

25792 (WHC-SA–1694) **Tank waste chemistry: A new understanding of waste aging.** Babad, H. (Westinghouse Hanford Co., Richland, WA (United States)); Camaioni, D.M.; Lilga, M.A.; Samuels, W.D.; Strachan, D.M. Westinghouse Hanford Co., Richland, WA (United States). Feb 1993. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930205–70: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93014625. Source: OSTI; NTIS; INIS; GPO Dep.

There is concern about the risk of uncontrolled exothermic reaction(s) in Hanford Site waste tanks containing NO_3^-/NO_2 based salts and/or metal hydroxide sludges in combination with organics or ferrocyanides. However, gradual oxidation of the waste in the tanks to less reactive species appears to have reduced the risk. In addition, wastes sampled to date contain sufficiently large quantities of water so that propagation reactions are highly unlikely. This paper investigates various aspects of the aging of Hanford tank wastes.

25793 (WHC-SA–1697) **Tank waste retrieval issues and options for their resolution.** Miller, W.C. (Westinghouse Savannah River Co., Aiken, SC (United States)); Henderson, J.M.; Shen, E.J.; Stegen, L.C.; Wrzesinski, W.R. Westinghouse Savannah River Co., Aiken, SC (United States). Feb 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930205–68: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93014488. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy has undertaken the significant challenge of remediating the high-level wastes currently being stored underground in tanks located at the Hanford Site in Washington State. A key element of the remediation process is the recovery of these defense production wastes in preparation for downstream processing and disposal. A number of technical and programmatic issues have been identified with the waste recovery process, referred to as retrieval. In response to these issues, a retrieval strategy has been developed that addresses the need to meet legal obligations and balances the technology development needs. This strategy has been embodied into a retrieval plan, which has looked at numerous retrieval system approaches and establishes a basis for development of the selected systems. The strategy and plan are evolutionary in approach, with the ability to change when waste properties are better understood, key decisions are negotiated, and lessons learned are available from initial retrieval efforts.

25794 (WHC-SA–1701) **Recent results from characterization of ferrocyanide wastes at the Hanford Site.** Simpson, B.C.; Babad, H.; Cash, R.J. Westinghouse Hanford Co., Richland, WA (United States). Feb 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930205–67: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93014491. Source: OSTI; NTIS; INIS; GPO Dep.

Public Law 101-510, Section 3137, "Safety Measures for Waste Tanks at Hanford Nuclear Reservation," (1) requires that Westinghouse Hanford Company develop plans to resolve safety issues for tanks that could experience excessive temperature changes or pressure increases, resulting in a release of radioactive material from any high-level waste tank at the Hanford Site. Fifty-three tanks have been identified and categorized by tank contents. These include tanks that (a) contain ferrocyanide compounds, (b) have the potential for flammable gas generation, (c) contain organics, or (d) have high-heat loads. The ferrocyanide and hydrogen gas safety issues have been declared unreviewed safety questions (USQs) because postulated accident scenarios may fall outside safety envelopes defined by existing safety analysis documentation (2). Both USQ issues were reported at Waste Management '92 (3, 4). Detailed research has been conducted to provide insight into the severity of the ferrocyanide tank safety issue. Work included waste characterization and investigation of the energetic behavior of ferrocyanide waste material. The data presented will focus on "In-Farm" simulant studies and information from tank 241-C-112, core samples 34 and 36.

25795 (WHC-SA–1708) **Low-level waste disposal - Grout issue and alternative waste form technology.** Epstein, J.L. (Westinghouse Hanford Co., Richland, WA (United States)); Westski, J.H. Jr. Westinghouse Hanford Co., Richland, WA (United States). Feb 1993. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930205–69: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93014485. Source: OSTI; NTIS; INIS; GPO Dep.

Based on the Record of Decision (1) for the Hanford Defense Waste Environmental Impact Statement (HDW-EIS) (2), the US Department of Energy (DOE) is planning to dispose of the low-level fraction of double-shell tank (DST) waste by solidifying the liquid waste as a cement-based grout placed in near-surface, reinforced, lined concrete vaults at the Hanford Site. In 1989, the Hanford Grout Disposal Program (HGDP) completed a full-scale demonstration campaign by successfully grouting 3,800 cubic meters (1 million gallons) of low radioactivity, nonhazardous, phosphate/sulfate waste (PSW), mainly decontamination solution from N Reactor. The HGDP is now preparing for restart of the facility to grout a higher level activity, mixed waste double-shell slurry feed (DSSF). This greater radionuclide and hazardous waste content has resulted in a number of issues confronting the disposal system and the program. This paper will present a brief summary of the Grout Treatment Facility's components and features and will provide a status of the HGDP, concentrating on the major issues and challenges resulting from the higher radionuclide and hazardous content of the waste. The following major issues will be discussed: Formulation (cementitious mix) development; the Performance Assessment (PA) (3) to show compliance of the disposal system to long-term environmental protection objectives; and the impacts of grouting on waste volume projections and tank space needs.

25796 (WHC-SA–1729) **The impact of safety analyses on the design of the Hanford Waste Vitrification Plant.** Koppenaal, T.J. (WasteChem Corp., Irvine, CA (United States)); Yee, A.K.; Reisdorf, J.B.; Hall, B.W. Westinghouse Hanford Co., Richland, WA (United States). Apr 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930408–80: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93016478. Source: OSTI; NTIS; INIS; GPO Dep.

Accident analyses are being performed to evaluate and document the safety of the Hanford Waste Vitrification Plant (HWVP). The safety of the HWVP is assessed by evaluating worst-case accident scenarios and determining the dose to offsite and onsite receptors. Air dispersion modeling is done with the GENII computer code. Three accidents are summarized in this paper, and their effects on the safety and the design of the HWVP are demonstrated.

25797 (WHC-SA–1735) **Tolerancing requirements for remote handling at the Hanford Waste Vitrification Plant.** Van Katwijk, C. (Westinghouse Hanford Co., Richland, WA (United States)); Keenan, R.M.; Bullis, R.E. Westinghouse Hanford Co., Richland, WA (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930408–67: International high-level radioactive waste management conference, Las Vegas, NV (United States), 25-29 Apr 1993). Order Number DE93011277. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Waste Vitrification Plant (HWVP) is being designed by Fluor Daniel, Inc. with Waste Chem Corporation as Fluor Daniel, Inc.'s major subcontractor specializing in vitrification and remote system technologies. United Engineers and Constructors (UE&C)/ Catalytic (UCAT) will construct the plant. Westinghouse Hanford

Company is the Project Integration manager and Business manager, and as the plant operator it provides technical direction to the Architect/Engineer team (A/E) and constructor on behalf of the US Department of Energy - Richland Field Office. The A/E has developed, in cooperation with UE&C, Westinghouse Hanford Company, and the US Department of Energy, a new and innovative approach to installations of the many remote nozzles and electrical connectors that must be installed to demanding tolerances. This paper summarizes the key elements of the HWVP approach.

25798 (WHC-SA–1748) **Waste separations and pretreatment technology development in the Underground Storage Tank–Integrated Demonstration Program.** Cruse, J.M. Westinghouse Hanford Co., Richland, WA (United States). Apr 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930702–25: Pressure vessels and piping conference, Denver, CO (United States), 25-29 Jul 1993). Order Number DE93014189. Source: OSTI; NTIS; INIS; GPO Dep.

The principal objective of the Underground Storage Tank Integrated Demonstration (UST-ID) Program is the demonstration and continued development of technologies suitable for the remediation of USTs. The most promising new technologies are selected for demonstration, testing, and evaluation. The objective is the eventual transfer of new technologies as a system to full-scale remediation at US Department of Energy (DOE) complexes and sites in the private sector. Technologies under development in the UST-ID Program are targeted toward use in remediation actions at the following five DOE participant sites: Hanford, Fernald, Idaho, Oak Ridge, and Savannah River. Combined, these participant sites have more than 300 USTs containing more than 100 m gal of high-level and low-level radioactive liquid waste. This paper focuses on the Waste Separations and Pretreatment area of the UST-ID, summarizing the currently funded technology development projects. In this area, several "compact processing units" (CPUs) are being developed to effect near-term demonstration and deployment of promising processes in actual tank environments. The CPU design and development approach is summarized. A number of programmatic issues are discussed, including onsite and offsite transportation of potentially contaminated processing systems, containment design criteria, including applicable codes and standards, and operation and maintenance of such systems in a developmental testing environment.

25799 (WHC-SA–1788) **Design of the Waste Receiving and Processing Module 2A Facility.** Lamberd, D.L. Westinghouse Hanford Co., Richland, WA (United States). Mar 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930873–5: 2. international mixed waste symposium, Baltimore, MD (United States), 17-20 Aug 1993). Order Number DE93012611. Source: OSTI; NTIS; INIS; GPO Dep.

Westinghouse Hanford Company has determined that a facility is required for the treatment of mixed low-level waste at the Hanford Site. The mission of that facility will be to receive, process/treat, package, certify, and ship the contact-handled, mixed low-level waste that must be handled by Hanford Site to permanent disposal. Preconceptual and conceptual design studies were performed by United Engineers and Constructors, and a conceptual design report was issued. This report presents a summary of the conceptual design for a facility that will meet the mission established.

25800 (WHC-SA–1789) **An approach for sampling solid heterogeneous waste at the Hanford Site waste receiving and processing and solid waste projects.** Sexton, R.A. Westinghouse Hanford Co., Richland, WA (United States). Mar 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930873–10: 2. international mixed waste symposium, Baltimore, MD (United States), 17-20 Aug 1993). Order Number DE93013002. Source: OSTI; NTIS; INIS; GPO Dep.

This paper addresses the problem of obtaining meaningful data from samples of solid heterogeneous waste while maintaining sample rates as low as practical. The Waste Receiving and Processing Facility, Module 1, at the Hanford Site in south-central Washington State will process mostly heterogeneous solid wastes. The presence of hazardous materials is documented for some packages and unknown for others. Waste characterization is needed to segregate the waste, meet waste acceptance and shipping requirements, and meet facility permitting requirements. Sampling and analysis are expensive, and no amount of sampling will produce absolute certainty of waste contents. A sampling strategy is proposed that provides acceptable confidence with achievable sampling rates.

25801 (WHC-SA–1795) **Low-level radioactive mixed waste land disposal facility – Permanent disposal.** Erpenbeck, E.G.; Jasen, W.G. Westinghouse Hanford Co., Richland, WA (United States). Mar 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930873–14: 2. international mixed waste symposium, Baltimore, MD (United States), 17-20 Aug 1993). Order Number DE93012616. Source: OSTI; NTIS; INIS; GPO Dep.

Radioactive mixed waste (RMW) disposal at US Department of Energy (DOE) facilities is subject to the Resource Conservation and Recovery Act of 1976 (RCRA) and the Hazardous and Solid Waste Amendments of 1984 (HSWA). Westinghouse Hanford Company, in Richland, Washington, has completed the design of a radioactive mixed waste land disposal facility, which is based on the best available technology compliant with RCRA. When completed, this facility will provide permanent disposal of solid RMW, after treatment, in accordance with the Land Disposal Restrictions. The facility includes a double clay and geosynthetic liner with a leachate collection system to minimize potential leakage of radioactive or hazardous constituents from the landfill. The two clay liners will be capable of achieving a permeability of less than 1×10^{-7} cm/s. The two clay liners, along with the two high density polyethylene (HDPE) liners and the leachate collection and removal system, provide a more than conservative, physical containment of any potential radioactive and/or hazardous contamination.

25802 (WHC-SA–1810) **Time and motion simulation of the WRAP Module 1 Facility.** Van Zanten, K.D. (United Engineers and Constructors, Inc., Denver, CO (United States)); Weidert, J.R. Westinghouse Hanford Co., Richland, WA (United States). Feb 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930205–60: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93011274. Source: OSTI; NTIS; INIS; GPO Dep.

A Time and Motion simulation model was developed for the Waste Receiving and Processing (WRAP) Module 1 Facility which will be located at the Hanford site. The simulation model was developed using the WITNESS computer program licensed from AT&T ISTEL. The model simulates the movement of 6,825 drums per year of transuranic (TRU) and low level waste (LLW) through the WRAP 1 Facility. In the WRAP 1 Facility, four main areas were modeled: Receiving, Non-Destructive Examination/Non-Destructive Assay (NDE/NDA), Waste Process and Shipping. Movement of waste drums through the plant is accomplished with forklifts, roller conveyors, two automated guided vehicles (AGV's), lift tables, jib cranes and pallet transfer carts. In-plant drum storage is provided by an automated storage and retrieval system (ASRS) for palletized drums in the Receiving/Shipping areas, a 12-drum storage carousel in the NDE/NDA area and a 24-drum storage carousel in the Waste Process area. The process simulation models use a color graphic display of plant operations to show drum (or pallet) movement throughout the plant. Actual speeds of vehicles, conveyors and forklifts are simulated in the model as well as machine cycle times, delay times, and stop times. Vehicle load and unload times, and acceleration and deceleration are included in the model. Distributions for the arrival of trucks delivering pallets or trucks leaving with waste drums or pallets are included in the model. Random numbers for distributions are assigned to determine the effect of variability on plant performance. The simulation program generates a full range of reports that allows users to determine the plant throughput under a wide variety of conditions. Typically a warm-up period is run to allow drums to complete travel through the system until steady "steady-state" operation is achieved. The model is then run at these steady-state conditions for several days, weeks or even years, depending on the complexity of the model.

25803 (WHC-SA–1813) **Organizational impacts to conduct of operations.** Ames, C.P. Westinghouse Hanford Co., Richland, WA (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930538–1: 4. conduct of operations workshop: the key to

continued success, Tampa, FL (United States), 4-6 May 1993). Order Number DE93014630. Source: OSTI; NTIS; GPO Dep.

The Plutonium Finishing Plant has been operating since its construction in 1949. The facility mission has been to support plutonium production and handling activities. The operating organization was developed to address the various missions and traditionally has been based on task definitions. This division by tasks shared responsibility and loss of accountability. Conduct of Operations deal with structured lines of authority, defined responsibilities at the lowest level, and accountability of personnel to those defined responsibilities. This shared responsibility is counter to the philosophy of Conduct of Operations when large aspects of facility operation and control are not addressed. The Plutonium Finishing Plant Operations organization identified the impacts to Conduct of Operations and reorganized to clearly define responsibilities and to enhance the communication-chain by streamlining the organizational structure. This report details organizational structure at the Plutonium Finishing Plant.

25804 (WHC-SA–1830) **The United States Department of Energy process for performance assessment for disposal of low-level radioactive waste.** Wood, D.E. (Westinghouse Hanford Co., Richland, WA (United States)); Owens, K.W.; Wilhite, E.L.; Duggan, G.J. Westinghouse Hanford Co., Richland, WA (United States). Feb 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930906–2: '93 international conference on nuclear waste management and environmental remediation, Prague (Czech Republic), 5-11 Sep 1993). Order Number DE93008179. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) manages disposal of low-level radioactive waste through the requirements of DOE Order 5820.2A on Radioactive Waste Management. The order specifies long-term performance objectives for permanent disposal, requires a performance assessment to determine compliance with those objectives, and establishes a Peer Review Panel to review those assessments for technical quality and completeness. A Performance Assessment Task Team has been established to provide guidance and recommend policy for implementation and interpretation of the requirements to those preparing the assessments. This paper describes the requirements, the Peer Review Panel, the Performance Assessment Task Team, and their activities to date.

25805 (WHC-SA–1837) **Tank waste pretreatment issues, alternatives and strategies for resolution.** Miller, W.C. (Westinghouse Hanford Co., Richland, WA (United States)); Appel, J.; Barton, W.B.; Orme, R.M.; Holton, L.K. Jr. Westinghouse Hanford Co., Richland, WA (United States). Feb 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930205–66: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93014490. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) has established the Tank Waste Remediation System (TWRS) to safely manage and dispose of the Hanford Site tank waste. The overall strategy for disposing of tank waste is evolving and initial recommendations on a course of action are expected in March, 1993. Pretreatment of these wastes may be required for one or both of the following reasons: (1) resolution of tank safety issues, and (2) preparation of low level and high level waste fractions for disposal. Pretreatment is faced with several issues that must be addressed by the deployment strategies that are being formulated. These issues are identified. There is also a discussion of several pretreatment deployment strategies and how these strategies address the issues. Finally, the technology alternatives that are being considered for the pretreatment function are briefly discussed.

25806 (WHC-SA–1846) **Master Safety Analysis Report (SAR) approach for solid waste treatment, storage, and disposal facilities.** Bonner, A.L.; Estrellado, J.P. Jr. Westinghouse Hanford Co., Richland, WA (United States). Jun 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9306143–14: Energy Facility Contractors Group safety analysis meeting, Denver, CO (United States), 16-18 Jun 1993). Order Number DE93016476. Source: OSTI; NTIS; INIS; GPO Dep.

In 1989, the Hanford Site took on a new mission of waste remediation and environmental cleanup. The Hanford Site vision is to become the leader in environmental cleanup technology while bringing the site back to its environmental pristine condition. This technology drive to launch the Hanford site as the flagship of environmental restoration has been divided into several mission areas. This paper focuses on the solid waste management (SWM) mission.

25807 (WHC-SA–1866) **Hanford Site radioactive mixed waste thermal treatment initiative.** Place, B.G.; Riddelle, J.G. Westinghouse Hanford Co., Richland, WA (United States). Mar 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930572–5: 12. annual international symposium on thermal treatment technologies - incineration conference, Knoxville, TN (United States), 3-7 May 1993). Order Number DE93013005. Source: OSTI; NTIS; INIS; GPO Dep.

This paper is a progress report of current Westinghouse Hanford Company engineering activities related to the implementation of a program for the thermal treatment of the Hanford Site radioactive mixed waste. Topics discussed include a site-specific engineering study, the review of private sector capability in thermal treatment, and thermal treatment of some of the Hanford Site radioactive mixed waste at other US Department of Energy sites.

25808 (WHC-SA–1920) **Developing waste separations technologies in the Underground Storage Tank – Integrated Demonstration Program.** Cruse, J.M. Westinghouse Hanford Co., Richland, WA (United States). Apr 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930873–15: 2. international mixed waste symposium, Baltimore, MD (United States), 17-20 Aug 1993). Order Number DE93014164. Source: OSTI; NTIS; INIS; GPO Dep.

The principal objective of the Underground Storage Tank - Integrated Demonstration (UST-ID) Program is the demonstration and continued development of technologies suitable for the remediation of USTs. This paper focuses on the Waste Separations and Pretreatment area of the UST-ID, summarizing the currently funded technology development projects. In this area, several "compact processing units" are being developed to effect near-term demonstration and deployment of promising processes in actual tank environments. The compact processing units design and development approach is summarized. A number of programmatic issues are discussed, including onsite and offsite transportation of potentially contaminated processing systems, containment design criteria, including applicable codes and standards, and operation and maintenance of such systems in a developmental testing environment.

25809 (WHC-SA–1928) **Co-disposal of mixed waste materials.** Phillips, S.J.; Alexander, R.G.; Crane, P.J.; England, J.L.; Kemp, C.J.; Stewart, W.E. Westinghouse Hanford Co., Richland, WA (United States). Aug 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930873–20: 2. international mixed waste symposium, Baltimore, MD (United States), 17-20 Aug 1993). Order Number DE93016347. Source: OSTI; NTIS; INIS; GPO Dep.

Co-disposal of process waste streams with hazardous and radioactive materials in landfills results in large, use-efficiencies waste minimization and considerable cost savings. Wasterock, produced from nuclear and chemical process waste streams, is segregated, treated, tested to ensure regulatory compliance, and then is placed in mixed waste landfills, burial trenches, or existing environmental restoration sites. Large geotechnical unit operations are used to pretreat, stabilize, transport, and emplace wasterock into landfill or equivalent subsurface structures. Prototype system components currently are being developed for demonstration of co-disposal.

25810 (WHC-SP–0858-Rev.1) **Maintenance Implementation Plan for B Plant: Revision 1.** Tritt, S.E. Westinghouse Hanford Co., Richland, WA (United States). Apr 1993. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93014635. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of the Maintenance Implementation Plan (MIP) is to describe how the B Plant will implement the requirements established by US Department of Energy (DOE) Order 4330.4A,

Maintenance Management Program, Chapter II, "Nuclear Facilities" (DOE 1990). The plan provides a blueprint for a disciplined approach to implementation and compliance. Each element of the order is prioritized, categorized, and then placed into one of three phases for implementation.

25811 (WINCO–1122) **ICPP Waste Management Technology Development Program.** Hogg, G.W. (Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States)); Olson, A.L.; Knecht, D.A.; Bonkoski, M.J. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). Jan 1993. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. Order Number DE93009613. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of the decision to curtail reprocessing at the Idaho Chemical Processing Plant (ICPP), a Spent fuel and Waste Management Technology Development plan has been implemented to identify acceptable options for disposing of the (1) sodium-bearing liquid radioactive waste, (2) radioactive calcine, and (3) irradiated spent fuel stored at the Idaho National Engineering Laboratory (INEL). The plan was developed jointly by DOE and WINCO.

25812 (WINCO–11916) **Robotic systems for the high level waste tank farm replacement project at INEL.** Berger, A. (Redzone Robotics, Inc., Pittsburgh, PA (United States)); White, D.; Thompson, B.; Christensen, M. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. (CONF-930403–52: 5. topical meeting on robotics and remote systems, Knoxville, TN (United States), 26-29 Apr 1993). Order Number DE93015572. Source: OSTI; NTIS; INIS; GPO Dep.

Westinghouse Idaho Nuclear Company (WINCO) is specifying and designing a new high level waste tank farm at the Idaho National Engineering Laboratory (INEL). The farm consists of four underground storage tanks, which replace the existing tanks. The new facility includes provisions for remote operations. One of the planned remote operations is robotic inspection of the tank from the interior and exterior. This paper describes the process used to design the robotic system for the inspection tasks.

25813 (WINCO–11923) **Summary of meeting on disposal of LET&D HEPA filters.** Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). 21 Nov 1991. 130p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. Order Number DE93015571. Source: OSTI; NTIS; INIS; GPO Dep.

This report is a compilation of correspondence between Westinghouse Idaho Nuclear Company and the US EPA over a period of time from 1988 to 1992 (most from 1991-92) regarding waste management compliance with EPA regulations. Typical subjects include: compliance with satellite accumulation requirements; usage of "Sure Shot" containers in place of aerosol cans; notice of upcoming recyclable battery shipments; disposition of batteries; HEPA filter leach sampling and permit impacts; functional and operation requirements for the spent filter handling system; summary of meeting on disposal of LET and D HEPA filters; solvent substitution database report; and mercury vapor light analytical testing.

25814 (WSRC-MS–92-033) **Development of exposure scenarios for CERCLA risk assessments at the Savannah River Site.** Nix, D.W. (Westinghouse Savannah River Co., Aiken, SC (United States)); Immel, J.W.; Phifer, M.A. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-920307–92: Waste management '92, Tucson, AZ (United States), 1-5 Mar 1992). Order Number DE93011786. Source: OSTI; NTIS; INIS; GPO Dep.

A CERCLA Baseline Risk Assessment (BRA) is performed to determine if there are any potential risks to human health and the environment from waste unit at SRS. The SRS has numerous waste units to evaluate in the RFMU and CMS/FS programs and, in order to provide a consistent approach, four standard exposure scenarios were developed for exposure assessments to be used in human health risk assessments. The standard exposure scenarios are divided into two temporal categories: (a) Current Land Use in the BRA, and (b) Future Land Use in the RERA. The Current Land Use scenarios consist of the evaluation of human health risk for Industrial Exposure (of a worker not involved in waste unit characterization or remediation), a Trespasser, a hypothetical current On-site Resident, and an Off-site Resident. The Future Land Use scenario considers exposure to an On-site Resident following termination of institutional control in the absence of any remedial action (No Action Alternative), as well as evaluating potential remedial alternatives against the four scenarios from the BRA. A critical facet in the development of a BRA or RERA is the scoping of exposure scenarios that reflect actual conditions at a waste unit, rather than using factors such as EPA Standard Default Exposure Scenarios (OSWER Directive 9285.6-03) that are based on upper-bound exposures that tend to reflect worst case conditions. The use of site-specific information for developing risk assessment exposure scenarios will result in a more realistic estimate of Reasonable Maximum Exposure for SRS waste units.

25815 (WSRC-MS–92-268) **Measurement of cesium and mercury emissions from the vitrification of simulated high level radioactive waste.** Zamecnik, J.R. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930906–1: '93 international conference on nuclear waste management and environmental remediation, Prague (Czech Republic), 5-11 Sep 1993). Order Number DE93005546. Source: OSTI; NTIS; INIS; GPO Dep.

In the Defense Waste Processing Facility at the Savannah River Site, it is desired to measure non-radioactive cesium in the offgas system from the glass melter. From a pilot scale melter system, offgas particulate samples were taken on filter paper media and analyzed by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS). The ICP-MS method proved to be sufficiently sensitive to measure cesium quantities as low as 0.135 μg, with the sensitivity being limited by the background cesium present in the filter paper. This sensitivity allowed determination of cesium decontamination factors for four of the five major components of the offgas system. In addition, total particulate measurements were also made. Measurements of mercury decontamination factors were made on the same equipment; the results indicate that most of the mercury in the offgas system probably exists as elemental mercury and $HgCl_2$, with some HgO and Hg_2Cl_2. The decontamination factors determined for cesium, total particulate, and mercury all compared favorably with the design values.

25816 (WSRC-MS–92-485) **Relationship between borosilicate glass composition, structure, and durability test response (SRS).** Ramsey, W.G. (Westinghouse Savannah River Co., Aiken, SC (United States)); Jantzen, C.M.; Taylor, T.D. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930438–19: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93013578. Source: OSTI; NTIS; GPO Dep.

The chemical durability of 30 glasses from the $Na_2O \cdot B_2O_3 \cdot SiO_2 \cdot Al_2O_3 \cdot Fe_2O_3 \cdot CaO$ system was examined. Two standard leach tests, MCC-1P and PCT, were performed in unbuffered, deionized water. PCT tests were performed for durations up to twenty-four weeks to obtain glass dissolution rate data. Short-term MCC-1P test leachate solutions are determined by the glass composition. Long-term glass dissolution rates, however, are dependent on glass structure in addition to glass composition. The applicability of the free energy of hydration and other dissolution and durability models to this system is discussed.

25817 (WSRC-MS–92-503-Rev.1) **Conditions for precipitation of copper phases in DWPF waste glass: Revision 1.** Schumacher, R.F.; Ramsey, W.G. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930438–1-Rev.1: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93012799. Source: OSTI; NTIS; INIS; GPO Dep.

The Defense Waste Processing Facility precipitate hydrolysis process requires the use of copper formate as a catalyst. The expected absorbed radiation doses to the salt precipitate require higher levels of copper formate which increase the potential for the

precipitation of metallic copper containing phases in the DWPF Melter. The conditions required to avoid the precipitation of copper phases are described in this report.

25818 (WSRC-MS–93-002-Rev.1) **Waste acceptance product specifications for vitrified high-level waste forms: Revision 1.** Applewhite-Ramsey, A.; Sproull, J.F. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930438–Rev.1: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93014758. Source: OSTI; NTIS; INIS; GPO Dep.

The Nuclear Waste Policy Act of 1982 mandated that all high-level waste (HLW) be sent to a federal geologic repository for permanent disposal. DOE published the Environmental Assessment in 1982 which identified borosilicate glass as the chosen HLW form.[1] In 1985 the Department of Energy instituted a Waste Acceptance Process to assure that DWPF glass waste forms would be acceptable to such a repository. This assurance was important since production of waste forms will precede repository construction and licensing. As part of this Waste Acceptance Process, the DOE Office of Civilian Radioactive Waste Management (RW) formed the Waste Acceptance Committee (WAC). The WAC included representatives from the candidate repository sites, the waste producing sites and DOE. The WAC was responsible for developing the Waste Acceptance Preliminary Specifications (WAPS) which defined the requirements the waste forms must meet to be compatible with the candidate repository geologies.

25819 (WSRC-MS–93-056) **An investigation of Inventory Differences.** Harvel, C. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930749–6: 34. annual meeting of the Institute of Nuclear Materials Management, Scottsdale, AZ (United States), 18-21 Jul 1993). Order Number DE93017285. Source: OSTI; NTIS; INIS; GPO Dep.

The derivation of applicable Limits of Error for Inventory Differences (LEIDs) has been a long-term challenge for some material storage tanks at the Savannah River Site. Several investigations have been unsuccessful in producing usable estimates of the LEIDs. An investigation conducted in November of 1991 revealed some significant inventory characteristics. The corrective action involved the implementation of a multi-case LEID based on historical information and a correction in the use of the tank calibration charts for two storage tanks.

25820 (WSRC-MS–93-184) **UV disinfection pilot plant study at the Savannah River Site.** Huffines, R.L.; Beavers, B.A. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9303166–1: 1993 South Carolina environmental conference, Hilton Head, SC (United States), 30 Mar 1993). Order Number DE93012800. Source: OSTI; NTIS; GPO Dep.

An ultraviolet light disinfection system pilot plant was operated at the Savannah River Site Central Shops sanitary wastewater treatment package plant July 14, 1992 through August 13, 1992. The purpose was to determine the effectiveness of ultraviolet light disinfection on the effluent from the small package-type wastewater treatment plants currently used on-site. This pilot plant consisted of a rack of UV lights suspended in a stainless steel channel through which a sidestream of effluent from the treatment plant clarifier was pumped. Fecal coliform analyses were performed on the influent to and effluent from the pilot unit to verify the disinfection process. UV disinfection was highly effective in reducing fecal coliform colonies within NPDES permit limitations even under process upset conditions. The average fecal coliform reduction exceeded 99.7% using ultraviolet light disinfection under normal operating conditions at the package treatment plants.

25821 (WSRC-MS–93-202) **Treatment and disposal of a mixed F006 plating line sludge at the Savannah River Site.** Pickett, J.B.; Musall, J.C.; Martin, H.L. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930873–12: 2. international mixed waste symposium, Baltimore, MD (United States), 17-20 Aug 1993). Order Number DE93013827. Source: OSTI; NTIS; INIS; GPO Dep.

The Westinghouse Savannah River Company (WSRC), as the operating contractor for the Department of Energy (DOE) at the Savannah River Site (SRS) is implementing a program to treat and stabilize approximately 750,000 gallons of an F006 mixed (radioactive/hazardous) plating line wastewater sludge. The uranium contaminated sludge resulted from nickel plating of depleted uranium targets, which were subsequently irradiated to produce plutonium for the weapons program. With the end of the "cold war," no virgin plutonium weapons production is forecast, and only the currant SRS inventory of stored mixed plating line waste must be treated and disposed. A Life Cycle Cost analysis was used by WSRC to determine that the most cost effective approach was to treat the waste by a hazardous waste management sub-contractor, in a one time campaign. The analysis indicated that ~$40 million could be saved by this approach, vs. the original plan to construct a permanent SRS treatment facility. The sub-contractor will mobilize treatment equipment will be disposed to on-site SRS disposal vaults. This new approach also required a re-negotiation of a federal facility compliance agreement between the DOE and the Environmental Protection Agency.

25822 (WSRC-MS–93-215) **Pilot scale vitrification studies on hazardous and mixed wastes.** Bennert, D.M. (Clemson Univ., SC (United States). Dept. of Environmental Systems Engineering); Overcamp, T.J.; Compton, K.L.; Sargent, T.N. Jr.; Resce, J.L.; Bickford, D.F.; Jantzen, C.M. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930438–13: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93012798. Source: OSTI; NTIS; INIS; GPO Dep.

Over the past 30 years, the Department of Energy has committed extensive resources to the development of technologies suitable for the stabilization of high level radioactive waste. The objective of this work is to produce a vitreous wasteform capable of retaining the radioactive fractions in a leach resistant form. In an effort to further the development of technologies based within the DOE Complex, the DOE is making efforts to promote technical transfer initiatives that will bring these technologies to the private sector. To this end, the Department of Energy through the Savannah River Site is working with Clemson University's Environmental Systems Engineering Department to establish a laboratory dedicated to vitrification research. The laboratory is part of a cooperative effort between Westinghouse Savannah River Company, Clemson University, and their industrial partners EnVitCo, Inc., and Stir Melter, Inc.

25823 (WSRC-MS–93-222) **Canonical correlation of waste glass compositions and durability, including pH.** Oeksoy, D. (Alfred Univ., NY (United States)); Pye, L.D.; Bickford, D.F.; Ramsey, W.G. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930438–8: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93012754. Source: OSTI; NTIS; INIS; GPO Dep.

Control of waste glass durability is a major concern in the immobilization of radioactive and mixed wastes. Leaching rate in standardized laboratory tests is being used as a demonstration of consistency of the response of waste glasses in the final disposal environment. The leaching of silicate and borosilicate glasses containing alkali or alkaline earth elements is known to be autocatalytic, in that the initial ion exchange of alkali in the glass for hydrogen ions in water results in the formation of OH and increases the pH of the leachate. The increased pH then increases the rate of silicate network attack, accelerating the leaching effect. In well formulated glasses this effect reaches a thermodynamic equilibrium when leachate saturation of a critical species, such as silica, or a dynamic equilibrium is reached when the pH shift caused by incremental leaching has negligible effect on pH. This report analyzes results of a seven leach test on waste glasses.

25824 (WSRC-RP–92-252) **Supercritical water oxidation technology for DWPF.** Carter, J.T.; Gentilucci, J.A. Westinghouse Savannah River Co., Aiken, SC (United States). 7 Feb 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93015382. Source: OSTI; NTIS; GPO Dep.

At the request of Mr. H.L. Brandt and others in the Savannah River Field Office High Level Waste Division office, DWPF, and SRL personnel have reviewed two potential applications for supercritical water oxidation technology in DWPF. The first application would replace the current hydrolysis process by destroying the organic fractions of the precipitated cesium /potassium tetraphenylborate slurry. The second application pertains to liquid benzene destruction. After a thorough evaluation the first application is not recommended. The second is ready to be tested if needed.

25825 (WSRC-RP–92-568-Rev.1) **DWPF saltstone study: Effects of thermal history on leach index and physical integrity: Part 2, Final report: Revision 1.** Orebaugh, E.G. Westinghouse Savannah River Co., Aiken, SC (United States). 18 Nov 1992. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93015831. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the observations made during the curing and testing of DWPF simulated saltstones which have been cured under isothermal conditions in sealed glass envelopes at temperatures from room temperature to 95°C. This study was performed to evaluate the effect of curing at and around temperatures representing conditions created within large pours of grout. There appears to be no difference in the leaching resistance of samples cured at the same temperature for varying times to 1 year. Curing at higher temperatures decreases the effective diffusivity of this waste formulation. These results are encouraging in that leaching resistance for samples near the expected maximum vault temperature (55°C) show effective diffusion coefficients ($D_{effective}$ $\sim 10^{-8}$ cm^2/sec) that agree with previous work and values that are believed to adequately protect the groundwater. The isothermal conditions of these tests simulate the nearly adiabatic conditions existing near the centerline of the monolith. The elevated temperatures due to hydration heat decrease over long times. This has been simulated by a series (1X) of staged isothermal cures. Since modeling indicated it would take nearly two years for emplaced grout to cool to near ambient temperatures, accelerated (2X) cooling curves were also tested. Specimens cured under these staged-isothermal conditions appear to be no different from specimens cured under isothermal conditions for the same time at the maximum temperature. The unexpected generation of nitrous oxide within saltstone creates internal stresses which cause fracturing when exposed to leaching conditions. Such fracturing is not considered significant for saltstone emplaced in engineered vaults for disposal.

25826 (WSRC-RP–92-1093) **Ion exchange technology assessment report.** Duhn, E.F. Westinghouse Savannah River Co., Aiken, SC (United States). 1992. 98p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93016126. Source: OSTI; NTIS; INIS; GPO Dep.

In the execution of its charter, the SRS Ion Exchange Technology Assessment Team has determined that ion exchange (IX) technology has evolved to the point where it should now be considered as a viable alternative to the SRS reference ITP/LW/PH process. The ion exchange media available today offer the ability to design ion exchange processing systems tailored to the unique physical and chemical properties of SRS soluble HLW's. The technical assessment of IX technology and its applicability to the processing of SRS soluble HLW has demonstrated that IX is unquestionably a viable technology. A task team was chartered to evaluate the technology of ion exchange and its potential for replacing the present In-Tank Precipitation and proposed Late Wash processes to remove Cs, Sr, and Pu from soluble salt solutions at the Savannah River Site. This report documents the ion exchange technology assessment and conclusions of the task team.

25827 (WSRC-RP–92-1212) **Ammonium generation during SRAT cycle.** Hsu, C.W. Westinghouse Savannah River Co., Aiken, SC (United States). 13 Oct 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93015383. Source: OSTI; NTIS; INIS; GPO Dep.

During the IDMS noble-metal demonstration runs ammonium nitrate deposition was found in the vessel vent system of the feed preparation area. In the bench-scale experiments of studying the hydrogen generation during the sludge treatment cycle, ammonium ion production was also monitored. It was found that: During a simulation of the DWPF Cold Chemical Runs SRAT cycle no detectable amount of ammonium ions was generated when treating a non-noble-metal containing sludge simulant according to the nitric acid flowsheet. Ammonium ions were generated during the SRAT-SME cycle when treating the noble-metal containing sludge with either formic acid or nitric acid/late-washing PHA. This is due to the reaction between formic acid and nitrate catalyzed by the noble metals in the sludge simulant. Ammonium ion production closely followed the hydrogen evolution from the catalytic decomposition of formic acid. This report summarizes the results of the production of ammonia during the SRAT cycle.

25828 (WSRC-RP–92-1312) **Radiolytic hydrogen production from process vessels in HB line - production rates compared to evolution rates and discussion of LASL reviews.** Bibler, N.E. Westinghouse Savannah River Co., Aiken, SC (United States). 12 Nov 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014739. Source: OSTI; NTIS; GPO Dep.

Hydrogen production from radiolysis of aqueous solutions can create a safety hazard since hydrogen is flammable. At times this production can be significant, especially in HB line where nitric acid solutions containing high concentrations of Pu-238, an intense alpha emitter, are processed. The hydrogen production rates from these solutions are necessary for safety analyses of these process systems. The methods and conclusions of hydrogen production rate tests are provided in this report.

25829 (WSRC-RP–92-1392) **Travel to Tokai Vitrification Facility to discuss the melter and process operational experiences with noble metals: Foreign trip report, November 18–19, 1992.** Gutmann, T.S. (USDOE Savannah River Operations Office, Aiken, SC (United States)); Carter, J.T.; Hutson, N.D.; Palmer, R.A.; Harty, W.M.; Lamar, D.A. Westinghouse Savannah River Co., Aiken, SC (United States). 14 Dec 1992. 238p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93011431. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report documents the technical exchange meeting held between the United States Department of Energy (DOE) and the Power Reactor and Nuclear Fuel Development Corporation (PNC) of Japan. The meeting was held at PNC's Tokai Works located in Tokai-mura, about 65 miles northeast of Tokyo. This meeting was the fifth in the series of technical exchanges held to date under the bilateral agreement between DOE and PNC on vitrification technology.

25830 (WSRC-RP–93-469) **Savannah River Site TIER TWO report 1992: Emergency and Hazardous Chemical Inventory report.** Still, G.O. Westinghouse Savannah River Co., Aiken, SC (United States). Mar 1993. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93016134. Source: OSTI; NTIS; INIS; GPO Dep.

This report is a compilation of data on emergency and hazardous chemicals stored at the Savannah River Site. The report lists quantities of materials, general types of storage containment, types of storage conditions (pressure and temperature), and other information of relevance for particular materials.

25831 (WSRC-TR–91-566) **Carbon-14 removal for disposal of reactor deionizer resins.** Carlton, W.H.; Baumann, E.W. Westinghouse Savannah River Co., Aiken, SC (United States). 31 Oct 1991. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014747. Source: OSTI; NTIS; INIS; GPO Dep.

Disposal of depleted ion exchange resins from the primary system of the Savannah River Site (SRS) reactors is complicated by the presence of Carbon-14. Because Carbon-14 has a long half-life (5,730 years) and high mobility in soils, burial of the resins is no

longer a viable option. Consequently some 35 spent reactor deionizers have accumulated that are to be stored aboveground in H-Area for an indefinite period. Spent deionizers containing Carbon-14 will continue to accumulate with operation of the present production reactors and would also accumulate from the proposed heavy water new production reactor. Removal of the Carbon-14 from the resins would reduce the volume of Carbon-14 bearing waste and enable the resins to be disposed of as low-level waste. Studies at SRS have indicated that the Carbon-14 from reactor primary coolant is mostly retained by the resins as the bicarbonate anion. Thus Carbon-14 removal might be accomplished by an acidification operation with trapping of the carbon dioxide released, for separate disposal. Conversion of the bicarbonate from the resin to barium carbonate, for example, would reduce the volume of waste more than a hundredfold. Displacement and recovery of Carbon-14 dioxide from reactor coolant deionizers by acid treatment has been reported by the Canadians. This memorandum recommends that a process be developed for Carbon-14 dioxide removal from SRS spent reactor deionizer resins, drawing on the Canadian experience.

25832 (WSRC-TR–92-421) **Revisions to the hydrogen gas generation computer model.** Jerrell, J.W. Westinghouse Savannah River Co., Aiken, SC (United States). 31 Aug 1992. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93012136. Source: OSTI; NTIS; GPO Dep.

Waste Management Technology has requested SRTC to maintain and extend a previously developed computer model, TRUGAS, which calculates hydrogen gas concentrations within the transuranic (TRU) waste drums. TRUGAS was written by Frank G. Smith using the BASIC language and is described in the report A Computer Model of gas Generation and Transport within TRU Waste Drums (DP- 1754). The computer model has been partially validated by yielding results similar to experimental data collected at SRL and LANL over a wide range of conditions. The model was created to provide the capability of predicting conditions that could potentially lead to the formation of flammable gas concentrations within drums, and to assess proposed drum venting methods. The model has served as a tool in determining how gas concentrations are affected by parameters such as filter vent sizes, waste composition, gas generation values, the number and types of enclosures, water instrusion into the drum, and curie loading. The success of the TRUGAS model has prompted an interest in the 'program's maintenance and enhancement. Experimental data continues to be collected at various sites on such parameters as permeability values, packaging arrangements, filter designs, and waste contents. Information provided by this data is used to improve the accuracy of the model's predictions. Also, several modifications to the model have been made to enlarge the scope of problems which can be analyzed. For instance, the model has been used to calculate hydrogen concentrations inside steel cabinets containing retired glove boxes (WSRC-RP-89-762). The revised TRUGAS computer model, H2GAS, is described in this report. This report summarizes all modifications made to the TRUGAS computer model and provides documentation useful for making future updates to H2GAS.

25833 (WSRC-TR–93-029) **Monosodium titanate particle characterization.** Chandler, G.T.; Hobbs, D.T. Westinghouse Savannah River Co., Aiken, SC (United States). 12 Jan 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93015890. Source: OSTI; NTIS; INIS; GPO Dep.

A characterization study was performed on monosodium titanate (MST) particles to determine the effect of high shear forces expected from the In-Tank Precipitation (ITP) process pumps on the particle size distribution. The particles were characterized using particle size analysis and scanning electron microscopy (SEM). No significant changes in particle size distributions were observed between as-received MST and after 2–4 hours of shearing. Both as-received and sheared MST particles contained a large percentage of porosity with pore sizes on the order of 500 to 2,000 Angstroms. Because of the large percentage of porosity, the overall surface area of the MST is dominated by the internal surfaces. The uranium and plutonium species present in the waste solution will have access to both interior and exterior surfaces. Therefore, uranium and plutonium loading should not be a strong function of MST particle size.

25834 (WSRC-TR–93-090) **Electrochemical processing of nitrate waste solutions: Phase 2, Final report.** Genders, D. (Electrosynthesis Co., Inc., Cheektowaga, NY (US)); Weinberg, N.; Hartsough, D. Westinghouse Savannah River Co., Aiken, SC (United States); Electrosynthesis Co., Inc., Cheektowaga, NY (United States). 7 Oct 1992. 202p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93016166. Source: OSTI; NTIS; INIS; GPO Dep.

The second phase of research performed at The Electrosynthesis Co., Inc. has demonstrated the successful removal of nitrite and nitrate from a synthetic effluent stream via a direct electrochemical reduction at a cathode. It was shown that direct reduction occurs at good current efficiencies in 1,000 hour studies. The membrane separation process is not readily achievable for the removal of nitrites and nitrates due to poor current efficiencies and membrane stability problems. A direct reduction process was studied at various cathode materials in a flow cell using the complete synthetic mix. Lead was found to be the cathode material of choice, displaying good current efficiencies and stability in short and long term tests under conditions of high temperature and high current density. Several anode materials were studied in both undivided and divided cell configurations. A divided cell configuration was preferable because it would prevent re-oxidation of nitrite by the anode. The technical objective of eliminating electrode fouling and solids formation was achieved although anode materials which had demonstrated good stability in short term divided cell tests corroded in 1,000 hour experiments. The cause for corrosion is thought to be F^- ions from the synthetic mix migrating across the cation exchange membrane and forming HF in the acid anolyte. Other possibilities for anode materials were explored. A membrane separation process was investigated which employs an anion and cation exchange membrane to remove nitrite and nitrate, recovering caustic and nitric acid. Present research has shown poor current efficiencies for nitrite and nitrate transport across the anion exchange membrane due to co-migration of hydroxide anions. Precipitates form within the anion exchange membranes which would eventually result in the failure of the membranes. Electrochemical processing offers a highly promising and viable method for the treatment of nitrate waste solutions.

25835 (WSRC-TR–93-233) **DWPF recycle stream corrosion tests.** Zapp, P.E. Westinghouse Savannah River Co., Aiken, SC (United States). 21 Apr 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93016151. Source: OSTI; NTIS; GPO Dep.

Coupon immersion tests were performed on ASTM A537 Class 1 carbon steel in simulated DWPF recycle solutions at 90 $\pm$ 2°C, as part of the continuing effort to investigate the formation of shock-sensitive deposits. Coupons were partially immersed for four months in solutions of the same composition used previously at SRTC and at the DuPont Engineering Test Center (a salt solution containing 0.5 M hydroxide and 0.043 M nitrite). Shock-sensitive deposits were not seen on the coupons from this test. There was considerable general corrosion above the water line due to condensate and distilled water contact of the steel. New immersion tests are being planned for completion by September, 1993. The new test solution will reflect the recycle stream chemistry changes brought about by planned ammonia scrubbing in the DWPF.

25836 (YJT–92-24) **SIMFUEL dissolution studies in granitic groundwater leaching experiments at VTT.** Ollila, K. (Technical Research Centre of Finland, Espoo (Finland). Reactor Lab.). Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Dec 1992. [41p.] Order Number DE93629788. Source: OSTI; NTIS; INIS.

The dissolution behaviour of an irradiated analogue of spent nuclear fuel, SIMFUEL, was studied in synthetic granitic groundwater. The release of uranium and the minor components was monitored during static (bach) leaching experiments in oxic and anoxic (N_2) atmosphere at 25 deg C. Molybdenum, ruthenium, barium and zirconium showed a trend to congruent dissolution behaviour with UO_2 matrix towards the end of the experimental time (540 days)

under anoxic conditions. Under oxic conditions, molybdenum and strontium had higher release rates relative to the matrix (the exp. time of 220 days). The presence of particulate material in the leachates in anoxic atmosphere was shown by SEM/EDX and XRD analyses. The material retained on membrane after filtration consisted of Ca-rich and U-rich particles in addition to finely divided material. Calcite ($CaCO_3$) and uranium oxide were identified. (orig.).

25837 (YJT–92-25) **Sorption of uranium on rocks in anaerobic groundwater.** Hakanen, M. (Helsinki Univ. (Finland). Dept. of Radiochemistry); Lindberg, A. Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Dec 1992. [29p.] Order Number DE93629789. Source: OSTI; NTIS; INIS.

Spent nuclear fuel contains substantial amounts of long lived isotopes of actinoide elements, the most abundant of which is the oxide from uranium in the fuel matrix. The behaviour of uranium, also present in small concentrations in natural rocks and waters, is redox sensitive. The concentration controlling mechanisms in groundwaters of uranium are not well-known. In this work a series of laboratory experiments was made to study the redox and sorption behaviour of uranium under anaerobic conditions. The experiments indicated that a part of uranium(VI) was reduced to uranium(IV). The sorbed uranium was of mixed oxidation states. The redox potential of water was not an appropriate indicator of the U(IV)/U(VI) ratio. Spiking of the water with the U(IV) was followed by very strong sorption. The derived lower limit (conservative) and the realistic mass distribution ratios (R_d) for U(IV) are 0.7 m^3/kg and 3.5 m^3/kg. (orig.).

25838 (YJT–92-26) **Hydraulic fracturing rock stress measurement at Haestholmen, Finland.** Ljunggren, C. (Renco AB, Luleaa (Sweden)); Klasson, H. Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Dec 1992. [59p.] Order Number DE93630655. Source: OSTI; NTIS; INIS.

This report presents hydraulic fracturing measurements in two boreholes located on the Haestholmen island near Loviisa, Finland. The aim of the measurements was to provide stress data, forming input for the design of an underground facility for disposal of low- and medium-level waste as well as future plant decommissioning radioactive waste from the IVO reactor units situated on Haestholmen. The theoretical background to the hydrofracturing method is summarized, as is the equipment and experimental procedures used in the present case. All results obtained are presented and critically discussed. The final stress parameters presented are magnitudes and directions of the maximum and minimum horizontal stresses. Testing was successfully completed according to schedule in both boreholes.(orig.).

25839 (YJT–92-31) **Final disposal of spent fuel in the Finnish bedrock: Technical plans and safety assessment.** Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Dec 1992. [142p.] (In Finnish). Order Number DE93629790. Source: OSTI; NTIS; INIS.

Teollisuuden Voima Oy (TVO) is preparing for the final disposal of spent nuclear fuel from the Olkiluoto nuclear power plant (TVO-I and TVO-II reactors). According to present estimates, a total of 1840 tU of spent fuel will be accumulated during the 40-year lifetime of the power plant. An interim storage facility for spent fuel (TVO-KPA Store) has operated at Olkiluoto since 1987. The spent fuel will be held in storage for several decades before it is shipped to the repository site. Both train and road transportation are possible. The spent fuel will be encapsulated in composite copper and steel canisters (ACP Canister) in a facility that will be build above the ground on the site where the repository is located. The repository will be constructed at the depth of several hundreds of meters in the bedrock. In 1987 five areas were selected for preliminary site investigations. The safety analysis (TVO-92) that was carried out shows that the proposed safety criteria would be met at each of the candidate sites. In future expected conditions there would never be significant releases of radioactive substances to the biosphere. The site investigations will be continued in the period 1993 to 2000. In parallel, a R and D programme will be devoted to the safety and technology of final disposal. The site for final disposal will be selected in the year 2000 with the aim of having the capability to start the disposal operations in 2020.

25840 (YJT–92-32) **Final disposal of spent nuclear fuel in the Finnish bedrock: Preliminary site investigations.** Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Dec 1992. [359p.] (In Finnish). Order Number DE93629791. Source: OSTI; NTIS; INIS.

Teollisuuden Voima Oy (TVO) studies Finnish bedrock for the final disposal of the spent nuclear fuel from the Olkiluoto nuclear power plant. The study is in accordance with the decision in principle by Finnish government in 1983. The report is the summary of the preliminary site investigations carried out during the years 1987-1992. On the basis of these investigations a few areas will be selected for detailed site investigation. The characterization comprises five areas selected from the shortlist of potential candidate areas resulted in the earlier study during 1983-1985. Areas are located in different parts of Finland and they represent the main formations of the Finnish bedrock. Romuvaara area in Kuhmo and Veitsivaara area in Hyrynsalmi represent the Archean basement. Kivetty area in Konginkangas consists of mainly younger granitic rocks. Syyry in Sievi is located in transition area of Svecofennidic rocks and granitic rocks. Olkiluoto in Eurajoki represents migmatites in southern Finland. For the field investigations area-specific programs were planned and executed. The field investigations have comprised airborne survey by helicopter, geophysical surveys, geological mappings and samplings, deep and shallow core drillings, geophysical and hydrological borehole measurements and groundwater samplings.

25841 (YJT–93-03) **Long-term durability experiments with concrete-based waste packages in simulated repository conditions.** Ipatti, A. (Imatran Voima Oy, Vantaa (Finland)). Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Mar 1993. [71p.] Order Number DE93631592. Source: OSTI; NTIS; INIS.

Two extensive experiments on long-term durability of waste packages in simulated repository conditions are described. The first one is a 'half-scale experiment' comprising radioactive waste product and half-scale concrete containers in site specific groundwater conditions. The second one is 'full-scale experiment' including simulated inactive waste product and full-scale concrete container stored in slowly flowing fresh water. The scope of the experiments is to demonstrate long-term behaviour of the designed waste packages in contact with moderately concrete aggressive groundwater, and to evaluate the possible interactions between the waste product, concrete container and ground water. As the waste packages are made of high-quality concrete, provisions have been made to continue the experiments for several years.

25842 (YJT–93-04) **The dissolution of unirradiated UO_2 fuel pellets under simulated disposal conditions.** Ollila, K. (Technical Research Centre of Finland, Espoo (Finland). Reactor Lab.); Leino-Forsman, H. Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Mar 1993. [45p.] Order Number DE93631593. Source: OSTI; NTIS; INIS.

The dissolution behaviour of unirradiated UO_2 pellets was studied as a function of water composition under oxidizing and reducing conditions at 25 deg C. The waters included deionized water as the reference water, sodium bicarbonate solutions with varying bicarbonate content, and two different synthetic groundwaters. The release of uranium was measured during static batch dissolution experiments of long duration (3-4 years).

25843 (YJT–93-05) **Long term corrosion tests of OFHC-coppers in simulated repository conditions: Final report.** Aaltonen, P. (Technical Research Centre of Finland, Espoo (Finland). Metals Lab.); Varis, P. Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Mar 1993. [36p.] Order Number DE93631594. Source: OSTI; NTIS; INIS.

This research program 'long term corrosion tests of OFHC-coppers in simulated repository conditions' was planned to provide an experimental evaluation with respect to the theoretical calculations and forecasts made for the corrosion behaviour of OFHC-coppers in bentonite ground water environments at temperatures between 20-80 deg C. The aim of this study in the first place was to evaluate the effects of ground water composition, bentonite and temperature on the equilibrium and possible corrosion reactions between OFHC coppers and the simulated repository

environment. The tests were started in 1987 and this final report includes the results obtained after 72 months exposure time. (orig.).

25844 (YJT–93-06) **Application of the continuously-yielding joint model for studying disposal of high-level nuclear waste in crystalline rock.** Hakala, M. (Saanio and Riekkola Consulting Engineers, Helsinki (Finland)); Johansson, E.; Simonen, A.; Loring, L. Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Apr 1993. [68p.] Order Number DE93630656. Source: OSTI; NTIS; INIS.

The non-linear Continuously-Yielding (CY) joint model and its use in numerical analyses of a nuclear waste repository are studied in the report. On major advantage of using CY-model is that laboratory test results, if available, can directly be used in analyses thus reducing uncertainties about joint input parameters. The new testing machine MTS-815 of Helsinki University of Technology was used to determine the joint behaviour of some granitic joints from the depth of 400-600 m below the ground surface. The procedure for triaxial joint tests was refined during this work. Two programs called NormFit and SherFit were developed and tested to determine the best fit parameter values for CY-model from laboratory test results.

Accidents are defined as not planned events that may result in the emission of significative quantities of radioactive materials to the environment. The pilot plant has been specifically designed to prevent this type of accidents but there still exists the possibility that one or more accidents can be produced during the plant life. In a first phase, the emission of radionuclides to the environment were evaluated for 13 credible accidents. In a second phase, by means of the calculation program SEDA, specially adapted to this purpose, the critical doses of critical group were calculated for each accident. Due to the small capacity of the pilot plant and the long cooling period of treated fuel, it is concluded that the radiological consequences for the external environment are of very small magnitude. In this way, without need of developing complex fault- or event-trees, it is shown that any of the accidents falls into the non acceptable zone of Farmer diagram. (Author).

25846 (OEFZS–4637) **Qualitative comparison of the so-called biotransfer model.** Rejlek, G. (Hauptabteilung Entsorgungstechnik, Bereich Umwelt- und Verfahrenstechnik, Forschungszentrum Seibersdorf, Seibersdorf (Austria)). Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Jun 1992. [19p.] (In German). Order Number DE93628044. Source: OSTI; NTIS (US Sales Only); INIS.

As a part of the project 'Final Deposition of Low- and Medium-active Wastes from Hospitals, University Institutes and Industry' a need arose for a biotransfer model to be used with a deterministic safety analysis. A literature study should decide if an existing model could be adapted to the requirements of the 'final dump project' or it is necessary and meaningful to develop a novel, improved model. Because the second variant turned out true the requirements for the improved model are written down.

25847 (OEFZS–4638) **Transbios - a unified model for assessment of the effect of noxious materials in ground water to the biosphere. Compilation of the model.** Rejlek, G. (Hauptabteilung Entsorgungstechnik, Bereich Umwelt- und Verfahrenstechnik, Forschungszentrum Seibersdorf, Seibersdorf (Austria)). Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Jun 1992. [113p.] (In German). Order Number DE93628045. Source: OSTI; NTIS (US Sales Only); INIS.

This model of radionuclide propagation in the biosphere is part of the project 'Final Deposition of Low- and Medium- active Wastes from Hospitals, University Institutes and Industry'. The six parts are: a flow-and transport model in ground water, an evaporation-transpiration model, a transfer model soil-to-plant, a water cycle- and a food chain model. Solutions are designed and peculiarities of the program are outlined. Finally the individual parts are integrated into the overall model.

25848 (WINCO–11906) **NO_x Abatement Pilot Plant 90-day test results report.** McCray, J.A. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Boardman, R.D. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States); EG and G Idaho, Inc., Idaho Falls, ID (United States). 30 Aug 1991. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. Order Number DE93014874. Source: OSTI; NTIS; INIS; GPO Dep.

High-level radioactive liquid wastes produced during nuclear fuel reprocessing at the Idaho Chemical Processing Plant are calcined in the New Waste Calcining Facility (NWCF) to provide both volume reduction and a more stable waste form. Because a large component of the HLW is nitric acid, high levels of oxides of nitrogen (NO_x) are produced in the process and discharged to the environment via the calciner off-gas. The NO_x abatement program is required by the new Fuel Processing Restoration (FPR) project permit to construct to reduce NO_x emissions from the NWCF. Extensive research and development has indicated that the selective catalytic reduction (SCR) process is the most promising technology for treating the NWCF off-gas. Pilot plant tests were performed to determine the compatibility of the SCR process with actual NWCF off-gas. Test results indicate that the SCR process is a viable method for abating the NO_x from the NWCF off-gas. Reduction efficiencies over 95% can be obtained, with minimal amounts of ammonia slip, provided favorable operating conditions exist. Two reactors operated with series flow will provide optimum reduction capabilities. Typical operation should be performed with a first reactor stage gas space velocity of 20,000 hr^{-1} and an inlet temperature of 320°C. The first stage exhaust NO_x concentration will then dictate the parameter settings for the second stage. Operation should always strive for a peak reactor temperature of 520°C in both reactors, with minimal NH_3 slip from the second reactor. Frequent fluctuations in the NWCF off-gas NO_x concentration will require a full-scale reduction facility that is versatile and quick-responding. Sudden changes in NWCF off-gas NO_x concentrations will require quick detection and immediate response to avoid reactor bed over-heating and/or excessive ammonia slip.

25849 (ANL/RE–93/4) **Free vibration analysis of a tank containing two liquids.** Tang, Yu; Chang, Y.W. Argonne National Lab., IL (United States). May 1993. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93015437. Source: OSTI; NTIS; GPO Dep.

A study of the dynamic characteristics of rigidly supported upright circular cylindrical tanks containing two different liquids is presented. The governing differential equations for the tank-two liquid system are obtained by application of the Rayleigh-Ritz procedure in combination with Lagrange's equation. The response functions examined include the fundamental natural frequency, the associated mode of vibration and hydrodynamic pressure exerted against the tank wall. Unlike the cases of tanks containing one liquid in which the dynamic response is controlled by four parameters, the dynamic response of a tank that contains two liquids is controlled by six parameters. The numerical results are presented in tabular and graphic forms, and are compared with those of the

identical tank filled with one liquid. Also, a simple approximate equation for evaluating the fundamental natural frequency for preliminary design is proposed.

25850 (BNL–52372) **Dynamic soil pressures on rigid cylindrical vaults.** Veletsos, A.S. (Rice Univ., Houston, TX (United States)); Younan, A.H. Brookhaven National Lab., Upton, NY (United States). Feb 1993. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93013930. Source: OSTI; NTIS; GPO Dep.

A critical evaluation is made of the dynamic pressures and the associated forces induced by ground shaking on an upright, circular, rigid vault that is embedded in a uniform viscoelastic stratum of constant thickness and infinite extent in the horizontal plane. Both the vault and the stratum are presumed to be supported on a nondeformable base undergoing a space-invariant, uniform horizontal motion. The effects of both harmonic and earthquake-induced excitations are examined. Simple approximate expressions for the responses of the system are formulated, and comprehensive numerical data are presented which elucidate the underlying response mechanisms and the effects and relative importance of the various parameters involved. The parameters investigated include the height to radius ratio for the vault, the conditions at the vault-medium interface, and the material properties of the stratum. In addition to valuable insights into the response of the particular system being examined, the results presented provide a conceptual framework for the analysis and interpretation of solutions for more involved systems as well.

25851 (CONF-9304128–3) **Off-site contamination at Oak Ridge National Laboratory.** Setaro, J.A. Oak Ridge National Lab., TN (United States). [1993]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. Order Number DE93012962. Source: OSTI; NTIS; INIS; GPO Dep.

An upgrade of the radioactive liquid waste system at Oak Ridge National Laboratory (ORNL) had been under way for the past several years. One of the upgrades involves the construction of a Monitoring and Control Station (MCS) which will receive waste from an analytical chemistry building prior to the waste being discharged to the main waste processing area. The MCS was located in a radiologically clean area adjacent to the analytical chemistry facility and no monitoring of personnel was necessary. On December 29, 1992, workers became contaminated and left the site prior to the discovery of the contamination. The construction workers were not employees of the Facility Management Contractor, Martin Marietta Energy Systems, but were subcontractor employees answering to the Construction Manager, a different prime contractor.

25852 (DOE/CH/10324–T9) **Southern state radiological emergency preparedness and response plans: A collection of matrices.** Southern States Energy Board, Norcross, GA (United States). Jul 1989. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016306. Source: OSTI; NTIS; INIS; GPO Dep.

The Southern States Energy Board (SSEB) is an interstate compact organization that serves 16 states and the Commonwealth of Puerto Rico with information and analysis in energy and environmental matters. Technical support and services are offered in a variety of areas, including renewable and alternative energy technologies; energy conservation; acid rain; utility regulation; clean coal technologies and technology transfer, oil and natural gas supply; and solid, hazardous and radioactive materials management. SSEB has received support from the US Department of Energy for the regional analysis of high-level radioactive waste transportation issues. In the performance of its work in this area, SSEB formed the advisory Committee on High-Level Radioactive Materials Transportation, which comprises representatives from affected states and tribes. Among the waste transportation issues considered by SSEB and the committee are shipment routing, the impacts of Monitored Retrievable Storage, state liability in the event of an accident and emergency preparedness and response. This document addresses the latter by identifying the major elements of southern state emergency preparedness and response programs.

25853 (DOE/CH/10324–T13) **Southern states radiological emergency response laws and regulations.** Southern States Energy Board, Norcross, GA (United States). Feb 1989. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016310. Source: OSTI; NTIS; INIS; GPO Dep.

The radiological emergency response laws and regulations of the Southern States Energy Compact member states are in some cases disparate. Several states have very specific laws on radiological emergency response while in others, the statutory law mentions only emergency response to "natural disasters." Some states have adopted extensive regulations on the topic; others have none. For this reason, any general overview must necessarily discuss laws and regulations in general terms.

25854 (DOE/CH/10324–T17) **Southern states radiological emergency response laws and regulations.** Southern States Energy Board, Norcross, GA (United States). Jun 1990. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016314. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to provide a summary of the emergency response laws and regulations in place in the various states within the southern region for use by legislators, emergency response planners, the general public and all persons concerned about the existing legal framework for emergency response. SSEB expects to periodically update the report as necessary. Radiation protection regulations without emergency response provisions are not included in the summary. The radiological emergency response laws and regulations of the Southern States Energy Compact member states are in some cases disparate. Several states have very specific laws on radiological emergency response while in others, the statutory law mentions only emergency response to "natural disasters." Some states have adopted extensive regulations on the topic, others have none. For this reason, any general overview must necessarily discuss laws and regulations in general terms. State-by-state breakdowns are given for specific states.

25855 (DOE/EH–0317) **Environment, safety and health progress assessment of the Lawrence Livermore National Laboratory.** USDOE, Washington, DC (United States). Nov 1992. 257p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012804. Source: OSTI; NTIS; GPO Dep.

This report documents the result of the US Department of Energy (DOE) Environment, Safety and Health (ES&H) Progress Assessment of the Lawrence Livermore National Laboratory (LLNL) in Livermore, California. The onsite assessment, which was conducted from November 9 through November 20, 1992, included a selective review of the ES&H management systems and programs with principal focus on the Office of the Assistant Secretary for Defense Programs (DP); San Francisco Field Office (SF), including the Livermore Site Office (LSO); and the site contractor, the University of California. The purpose of the LLNL ES&H Progress Assessment is to provide the Secretary with an independent assessment of the adequacy and effectiveness of the DOE and contractor management structures, resources, and systems to address ES&H issues and requirements. The assessment was not a comprehensive compliance assessment of ES&H activities. The point of reference for assessing programs at LLNL was, for the most part, the Tiger Team Assessment of LLNL, which was conducted from February 26 through April 5, 1990. The LLNL Progress Assessment was conducted by a team of 12 professionals from various DOE offices and their support contractors, with expertise in the areas of management, environment, safety, and health. The Progress Assessment Team concluded that LLNL management recognizes the importance that the Secretary of Energy places on ES&H excellence and has responded with improvements in all ES&H areas. Progress has been made in addressing the deficiencies identified in the 1990 Tiger Team Assessment. Although much remains to be done and concerns were noted in several areas, these concerns do not diminish the significance of the progress made since the 1990 Tiger Team Assessment.

25856 (DOE/EIS–0185D-074-Vol.2) **Remedial investigation for the chemical plant area of the Weldon Spring Site: Volume 2.** USDOE Oak Ridge Field Office, TN (United States). Weldon

Spring Site Remedial Action Project; MK-Ferguson Co., Weldon Spring, MO (United States); Jacobs Engineering Group, Inc., Weldon Spring, MO (United States). Nov 1992. 424p. Engineering drawings for this project are identified as CAPE-3064. Inquiries may be directed to: Office of Scientific and Technical Information, P.O. Box 62, Oak Ridge, TN 37831.

This volume contains figures such as charts and maps identifying areas of contamination, and tables of compiled data on the types and amount of contamination.

25857 (DOE/FTR–93013119) **Travel to United Kingdom and Germany to transfer foreign landfill barrier and stabilization technologies both to and from the US Department of Energy complex sites: Foreign trip report, March 4–June 30, 1992.** Phillips, S.J. Westinghouse Hanford Co., Richland, WA (United States). 24 Aug 1992. 153p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93013119. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A review of United Kingdom (UK) and German technologies and materials for remediation of radioactive and/or hazardous waste landfill sites was made and documented as a result of a short-term foreign appointment. A working data base of materials for in situ treatment of landfills was compiled and recorded on DBASE IV software. Alternative technologies and equipment example engineering sketches were made. These illustrations are categorized relative to in situ treatment by physical, chemical, and thermal processes. Data base and technology engineering sketches have been sent to integrated demonstration and integrated program coordinators. A short form technical task plan (TTP) was written by the US and UK research engineers proposing a cooperative US private sector, DOE complex, and UK nuclear industry cooperative technology demonstration. This TTP delineates work to demonstrate contaminated media surface treatment with polymeric and granular materials at atmospheric weapons testing sites in Australia, the Christmas Islands, and the Marshall Islands. Foreign landfill stabilization technologies identified and evaluated for potential application at DOE sites are, for the most part, applicable if site treatment is limited to barrier placement. Further development of in situ treatment technologies that directly access the wasteform or contaminant plumes originating from the wasteform is required. Both UK and German development engineers and scientists are very supportive of cooperative landfill stabilization and general remediation demonstration efforts.

25858 (DOE/IG–0326) **Fernald Environmental Management Project remedial investigation and feasibility study.** Layton, J.C. USDOE Office of Inspector General, Oak Ridge, TN (United States). Eastern Regional Audit Office. 15 Apr 1993. 37p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge); INIS.

Environmental restoration involves the cleanup and restoration of US Department of Energy (DOE) sites and facilities contaminated with hazardous substances during past production or disposal activities. An important element of the environmental restoration process is the remedial investigation and feasibility study (RI/FS), which is designed to determine the extent of contamination and to identify alternatives for cleanup. The Office of the Assistant Secretary for Environmental Restoration and Waste Management is responsible for policy direction and oversight of DOE's environmental restoration program. The objective of the audit was to determine whether DOE and its contractors had developed effective management control systems to ensure that maximum benefits were obtained from the funds spent on the RI/FS at the Fernald Environmental Management Project. Although DOE had improved the Fernald RI/FS project over the previous 18 months, the project at Fernald was not planned and controlled cost effectively. This condition occurred because (1) DOE and its contractors lacked experience in the RI/FS process, (2) DOE and its contractors had not communicated effectively with one another and outside regulators, and (3) DOE had not placed enough emphasis on management control systems. As a result, after about 6 years and the expenditure of over $100 million on the RI/FS project at Fernald, DOE and the Environmental Protection Agency (EPA) had made no decisions as to future land use, cleanup methods, disposal sites, or the level of environmental protection needed for the site. For each year that the completion of the RI/FS and cleanup is unnecessarily delayed, DOE will be required to spend about $149 million to support site infrastructure costs. Finally, DOE was planning for the possible construction of waste storage buildings, estimated to cost $2.6 billion, when the need for the buildings had not been validated.

25859 (DOE/IG–0327) **The remedial investigation/feasibility study process at Oak Ridge National Laboratory.** USDOE Office of Inspector General, Oak Ridge, TN (United States). Eastern Regional Audit Office. 27 Apr 1993. 62p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge); INIS.

Report to the Secretary.

Martin Marietta Energy Systems, Inc. (Energy Systems), manages and operates the Oak Ridge National Laboratory (ORNL), Oak Ridge, Tennessee, under a cost-plus-award-fee contract administered by the Department of Energy's (DOE) Oak Ridge Field office (Field Office). Energy Systems' environmental restoration program is responsible for eliminating or reducing to prescribed safe levels the risks to the environment or to human health and safety posed by inactive and surplus sites and facilities that have been contaminated with radioactive, hazardous, or mixed wastes. Energy Systems subcontracted to perform the remedial investigation and feasibility study (RI/FS) at ORNL. The objective of our audit was to determine if the RI/FS at ORNL had been implemented in a manner that ensured accomplishment of the goals and objectives of the DOE Environmental Restoration Program. The audit disclosed that the subcontractor did not fully meet its contractual requirements. Specifically, environmental data produced by the subcontractor is of questionable value for meeting its contractual requirement to provide data supporting permanent remedial action. This condition occurred because neither the subcontractor nor Energy Systems adequately implemented all essential management controls, and neither Energy Systems nor DOE provided adequate contract administration. As a result, DOE has received little value for its RI/FS expenditures. We have recommended that DOE determine the allowability of an estimated $45 million of subcontractor RI/FS cost at ORNL, plus the cost of Energy Systems administering the subcontract. Furthermore, DOE will continue to pay unnecessary costs and experience cost growth and project delays until effective project management controls are implemented.

25860 (DOE/RL–92-18) **Semiworks source aggregate area management study report.** USDOE Richland Field Office, WA (United States). May 1993. 502p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93013051. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of an aggregate area management study (AAMS) for the Semi-Works Aggregate Area in the 200 Areas of the US Department of Energy (DOE) . Hanford Site in Washington State. This scoping level study provides the basis for initiating Remedial Investigation/Feasibility Study (RI/FS) activities under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) or Resource Conservation and Recovery Act (RCRA) Facility Investigations WD and Corrective Measures Studies (CMS) under RCRA. This report also integrates select RCRA treatment storage, or disposal (TSD) closure activities with CERCLA and RCRA past-practice investigations. This approach is described and justified in The Hanford Federal Facility Agreement and Consent Order Change Package. This strategy provides new concepts for: accelerating decision-malting by maximizing the use of existing data consistent with data quality objectives (DQOs); and undertaking expedited response actions (ERAS) and/or interim remedial measures (IRMs), as appropriate, to either remove threats to human health and welfare and the environment, or to reduce risk by reducing toxicity, mobility, or volume of contaminants.

25861 (DOE/RL–92-21-Rev.1) **300-FF-1 physical separations CERCLA treatability test plan: Revision 1.** USDOE Richland Field Office, WA (United States). May 1993. 58p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93014915. Source: OSTI; NTIS; INIS; GPO Dep.

This test plan describes specifications, responsibilities, and general procedures to be followed to conduct physical separations soil treatability tests in the north process pond of the 300-FF-1 Operable Unit at the Hanford Site. The overall objective of these tests is to evaluate the use of physical separations systems as a means of concentrating chemical and radioactive contaminants into fine soil fractions, and thereby minimizing waste volumes. If successful, the technology could be applied to clean up millions of cubic meters of contaminated soils at Hanford and other sites. In this document, physical separations refers to a simple and comparatively low cost technology to potentially achieve a significant reduction in the volume of contaminated soils without the use of chemical processes. Removal of metals and radioactive contaminants from the fine fraction of soils may require additional treatment such as chemical extraction, electromagnetic separation, or stabilization. Investigations/testing of these technologies are recommended to assess the economic and technical feasibility of additional treatment, but are not within the scope of this test. This plan provides guidance and specifications for two proposed treatability tests: one to be conducted by Westinghouse Hanford Company; and another proposed as competitive bid service contract. The main body of this test plan discusses the tests in general and items that are common to both tests. Attachment A discusses in detail the EPA system test and Attachment B discusses the vendor test.

25862 (DOE/UMTRA–050506-Vol.3-App.F) **Remedial action plan and site design for stabilization of the inactive uranium mill tailings sites at Rifle, Colorado: Final report: Volume 3, Appendix F, Final design, specifications, and drawings.** US-DOE Albuquerque Field Office, NM (United States). Uranium Mill Tailings Remedial Action Project Office; Colorado State Government, Denver, CO (United States). Feb 1992. 312p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC04-82AL16257. Order Number DE93012928. Source: OSTI; NTIS; GPO Dep.

Engineering drawings for this project are identified as CAPE-3054. Inquiries may be directed to: Office of Scientific and Technical Information, P.O. Box 62, Oak Ridge, TN 37831.

This volume contains Appendix F, bid schedule and specifications for remedial action on three sites: Old Rifle processing site; New Rifle processing site and Estes Gulch disposal site.

25863 (EGG-M–93135) **Pit 9 project: A private sector initiative.** Macdonald, D.W. (USDOE Idaho Field Office, Idaho Falls, ID (United States)); Hughes, F.P.; Burton, B.N. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-930873–7: 2. international mixed waste symposium, Baltimore, MD (United States), 17-20 Aug 1993). Order Number DE93013677. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the Pit 9 Comprehensive Demonstration which is intended to demonstrate a cost-effective approach to remediate an Idaho National Engineering Laboratory (INEL) waste disposal pit through a Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Interim Action. The remediation will include additional requirements, if needed, to provide high confidence that only minor additional work would be necessary to accomplish the final closure as part of the overall final closure strategy for the INEL's Subsurface Disposal Area (SDA).

25864 (EGG-WTD–10717) **Test plan for the field evaluation and demonstration of the Contamination Control Unit.** Winberg, M.R.; Thompson, D.N. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jun 1993. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93016636. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes test details of a full demonstration of the Contamination Control Unit (CCU). The CCU is a mobile trailer capable of employing the use of soil fixatives, dust suppression agents, misting, and vacuum systems. These systems can perform a large number of contamination control functions to support the Office of Waste Technology Development (OTD) Buried Waste Integrated Demonstration (BWID) projects, transuranic (TRU) waste retrieval operations, and emergency response for hazardous and radioactive materials incidents. The demonstration will include both performance testing at the North Holmes Laboratory Facility (NHLF) and field testing in conjunction with the Remote Excavation System Demonstration at the Cold Test Pit. The NHLF will test operational parameters using water only, and the field demonstration at the Cold Test Pit involves full scale operation of vacuum, fixant, misting, and dust suppression systems. Test objectives, detailed experimental procedures, and data quality objectives necessary to perform the field demonstration are included in this test plan.

25865 (ES/ER/TM–59) **Environmental Restoration Program pollution prevention performance measures for FY 1993 and 1994 remedial investigations.** Oak Ridge National Lab., TN (United States); Weston (Roy F.), Inc., Oak Ridge, TN (United States). Mar 1993. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93010884. Source: OSTI; NTIS; INIS; GPO Dep.

The Martin Marietta Energy Systems, Inc., Environmental Restoration (ER) Program adopted a Pollution Prevention Program in March 1991. The program's mission is to minimize waste and prevent pollution in remedial investigations (RI), feasibility studies (FS), decontamination and decommissioning (D&D), and surveillance and maintenance (S&M) site program activities. Mission success will result in volume and/or toxicity reduction of generated waste. Energy Systems is producing a fully developed a Numerical Scoring System (NSS) and actually scoring the generators of Investigation Derived Waste (IDW) at six ER sites: Oak Ridge National Laboratory (ORNL), the Oak Ridge Y-12 Plant, the Oak Ridge K-25 site, Paducah Gaseous Diffusion Plant (Paducah), and Portsmouth Uranium Enrichment Complex (Portsmouth). This report summarizes the findings of this initial numerical scoring evaluation and shows where improvements in the overall ER Pollution prevention program may be required. This report identifies a number of recommendations that, if implemented, would help to improve site-performance measures. The continued development of the NSS will support generators in maximizing their Pollution Prevention/Waste Minimization efforts. Further refinements of the NSS, as applicable suggest comments and/or recommendations for improvement.

25866 (HW–18846) **Outline of proram for testing air-supplied face masks used in P-10 atmospheres.** Adley, F.E. Hanford Works, Richland, WA (United States). 11 Sep 1950. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93017352. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report consists of an outline for a program for testing the air-supplied face masks currently being used as protection against P-10 atmospheres at HAPO. The test procedures which follow are intended to determine circumstances under which the mask ceases to offer protection to the wearer. To keep the scope of the test program to a minimum and also to facilitate interpretation of the findings in the light of P-10 atmospheres, the test conditions chosen were those which would be most unfavorable for the mask from a protection standpoint.

25867 (HW–27570) **Radiation exposure rates in the 222-S Process Control Laboratory.** Helgeson, G.L. Hanford Works, Richland, WA (United States). 1 Apr 1953. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93017353. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The objective of this study is to provide a simple method for calculating exposures for the various laboratory procedures which involve penetrating radiations. With this method it will be possible to evaluate and record on a day to day basis the total exposure received during laboratory work. It will also provide reliable information for exposure investigations.

25868 (PNL–8598) **A strategic analysis study-based approach to integrated risk assessment: Occupational health risks from environmental restoration and waste management activities at Hanford.** Mahaffey, J.A. (Pacific Northwest Lab., Richland, WA (United States)); Doctor, P.G.; Buschbom, R.L.; Glantz, C.S.; Daling, P.M.; Sever, L.E.; Vargo, G.J. Jr.; Strachan, D.M.; Pajunen, A.L.; Hoyt, R.C.; Ludowise, J.D. Pacific Northwest Lab., Richland, WA (United States). Jun 1993. 86p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93016577. Source: OSTI; NTIS; GPO Dep.

The goal of environmental restoration and waste management activities is to reduce public health risks or to delay risks to the future when new technology will be available for improved cleanup solutions. Actions to remediate the wastes on the Hanford Site will entail risks to workers, the public, and the environment that do not currently exist. In some circumstances, remediation activities will create new exposure pathways that are not present without cleanup activities. In addition, cleanup actions will redistribute existing health risks over time and space, and will likely shift health risks to cleanup workers in the short term. This report describes an approach to occupational risk assessment based on the Hanford Strategic Analysis Study and illustrates the approach by comparing worker risks for two options for remediation of N/K fuels, a subcategory of unprocessed irradiated fuels at Hanford.

25869 (PNL-SA–21832) **Potential CERCLA reauthorization issues relevant to US DOE's Environmental Restoration Program.** Siegel, M.R. (Pacific Northwest Lab., Richland, WA (United States)); McKinney, M.D.; Jaksch, J.A.; Dailey, R.L. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930205–36: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93009481. Source: OSTI; NTIS; INIS; GPO Dep.

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) is currently scheduled to be reauthorized in 1994. The US Department of Energy (DOE) has a significant stake in CERCLA reauthorization. CERCLA, along with its implementing regulation, the National Contingency Plan (NCP), is the principal legal authority governing DOE's environmental restoration program. The manner in which CERCLA-related issues are identified, evaluated, and dispatched may have a substantial impact on DOE's ability to conduct its environmental restoration program. A number of issues that impact DOE's environmental restoration program could be addressed through CERCLA reauthorization. These issues include the need to (1) address how the National Environmental Policy Act (NEPA) should be integrated into DOE CERCLA actions, (2) facilitate the streamlining of the Superfund process at DOE sites, (3) address the conflicts between the requirements of CERCLA and the Resource Conservation and Recovery Act (RCRA) that are especially relevant to DOE, (4) examine the criteria for waiving applicable or relevant and appropriate requirements (ARARs) at DOE sites, and (5) delineate the appropriate use of institutional controls at DOE sites.

25870 (PNL-SA–21870) **Investigation of potential for occurrence of molten soil displacement events during in situ vitrification of combustible wastes.** Roberts, J.S.; Strachan, C.W.; Luey, J. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830 ;FG06-89ER75522. (CONF-930205–51: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93010166. Source: OSTI; NTIS; INIS; GPO Dep.

Computer simulations are used to investigate the application of in situ vitrification (ISV) for processing contaminated soil containing high loadings of solid, compressible waste material, typical of landfills and solid waste trenches. Specifically, these simulations predict whether significant displacement of molten soil, due to large, 1 to 2 m diameter, gas bubbles rising up through the ISV melt, are likely to occur during processing of combustible waste-loaded sites. These bubbles are believed to originate from high-pressure regions below the melt caused by vaporization of water and gases generated by the combustion, volatilization, or pyrolyzation of combustible materials in the waste. Simulations were run using the TOUGH2 computer code to predict pressures underneath the ISV melt TOUGH2 is an unsaturated groundwater modeling code capable of treating non-isothermal problems. These simulations include moving melt front and simple pyrolysis models and investigate how the gas pressure in the soil below the melt is affected by melt progression rate, soil permeability, combustible and impermeable material loading. The following conclusions have been drawn based on the TOUGH2 simulations.

25871 (PNL-SA–21879) **Statistical evaluation of cleanup: How should it be done?.** Gilbert, R.O. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930205–47: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93010171. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses statistical issues that must be addressed when conducting statistical tests for the purpose of evaluating if a site has been remediated to guideline values or standards. The importance of using the Data Quality Objectives (DQO) process to plan and design the sampling plan is emphasized. Other topics discussed are: (1) accounting for the uncertainty of cleanup standards when conducting statistical tests, (2) determining the number of samples and measurements needed to attain specified DQOs, (3) considering whether the appropriate testing philosophy in a given situation is "guilty until proven innocent" or "innocent until proven guilty" when selecting a statistical test for evaluating the attainment of standards, (4) conducting tests using data sets that contain measurements that have been reported by the laboratory as less than the minimum detectable activity, and (5) selecting statistical tests that are appropriate for risk-based or background-based standards. A recent draft report by Berger that provides guidance on sampling plans and data analyses for final status surveys at US Nuclear Regulatory Commission licensed facilities serves as a focal point for discussion.

25872 (PNL-SA–21891) **Graphite electrode dc arc technology development for treatment of buried wastes.** Surma, J.E. (Pacific Northwest Lab., Richland, WA (United States)); Cohn, D.R.; Smatlak, D.L.; Thomas, P.; Woskov, P.P.; Titus, C.H.; Wittle, J.K.; Hamilton, R.A. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930205–1: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93009814. Source: OSTI; NTIS; INIS; GPO Dep.

A "National Laboratory-University-Industrial" three-way partnership has been established between the Pacific Northwest Laboratory (PNL), Massachusetts Institute of Technology (MIT), and Electro-Pyrolysis, Inc. (EPI) to develop graphite electrode DC arc technology for the treatment of buried wastes. This paper outlines the PNL-MIT-EPI program describing a series of engineering-scale DC arc furnace tests conducted in an EPI furnace at the Plasma Fusion Center at MIT, and a description of the second phase of this program involving the design, fabrication, and testing of a pilot-scale DC arc furnace. Included in this work is the development and implementation of diagnostics to evaluate and optimize high temperature thermal processes such as the DC arc technology.

25873 (PNL-SA–21895) **Involving stakeholders in evaluating environmental restoration technologies.** McCabe, G.H. (Battelle Seattle Research Center, WA (United States)); Serie, P.J. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930205–43: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93009812. Source: OSTI; NTIS; INIS; GPO Dep.

Involving citizens, interest groups, and regulators in environmental restoration and waste management programs is a challenge for government agencies and the organizations that support them. To be effective, such involvement activities must identify all individuals and groups who have a stake in the cleanup. Their participation must be early, substantive, and meaningful. Stockholders must be able to see how their input was considered and used, and feel that a good- faith effort was made to reconcile conflicting objectives. The Integrated Demonstration for Cleanup of Volatile Organic Compounds at Arid Sites (VOC-Arid ID) is a Department of Energy Office of Technology Development project located at Hanford. Along with technical evaluation of innovative cleanup technologies, the program is conducting an institutional assessment of regulatory and public acceptance of new technologies. Through a series of interviews and workshops, and use of a computerized information

management tool, stakeholders are having a voice in the evaluation. Public and regulatory reaction has been positive.

25874 (PNL-SA-21987) **Implementation of in situ vitrification technology for remediation of Oak Ridge contaminated soil sites: Past results and future plans.** Tixier, J.S. (Pacific Northwest Lab., Richland, WA (United States)); Powell, T.D.; Spalding, B.P.; Jacobs, G.K. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830 ;AC05-84OR21400. (CONF-930205--52: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93010172. Source: OSTI; NTIS; INIS; GPO Dep.

In situ vitrification is a thermal treatment technology being developed for remediation of contaminated soils. The process transforms easily leached, contaminated soils into a durable, leach-resistant. vitreous and crystalline monolith. This paper presents the results of the recent highly successful ISV demonstration conducted jointly by PNL and ORNL on a tracer-level quantity of radioactive sludge in a model trench at ORNL. A retention of ^{90}r in the vitreous and crystalline product of greater than 99.9999% was measured with a reduction in potential environmental mobility of more than two orders of magnitude. The paper also presents the current plans for continued collaboration on a two-setting treatability test on one portion of an old seepage pit at ORNL.

25875 (RFP-4714) **Implementation of DOE Order 5480.23 and 5480.22 Nuclear Safety Analysis Reports and technical safety requirements at EG&G Rocky Flats.** Satterwhite, D.; Reed, A. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. [1993]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. (CONF-9306143--Summ.: Energy Facility Contractors Group safety analysis meeting, Denver, CO (United States), 16-18 Jun 1993). Order Number DE93015412. Source: OSTI; NTIS; INIS; GPO Dep.

Short communication. ROCKY FLATS PLANT/safety analysis; REMEDIAL ACTION; REGULATIONS; IMPLEMENTATION; SAFETY; PLANNING

25876 (RFP-4723) **Development of an ambient air sampler that satisfies RF plant monitoring requirements.** Nininger, R.C.; Pauley, B.J. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. (CONF-9305193--1: 2. EG&G GOCO environmental conference, Idaho Falls, ID (United States), 12-14 May 1993). Order Number DE93012703. Source: OSTI; NTIS; INIS; GPO Dep.

EG&G Rocky Flats Plant (RFP) is developing a new ambient air particulate sampler to replace units that have been in service for about twenty years. The new sampler is required to operate at a flow rate approximately twice that of the existing samplers and admit particles as large as 70 micrometers aerodynamic diameter. The sampler provides two size fractions with separation at 10 micrometers. using a single stage impactor designed at RFP and carrying a Department of Energy (DOE) patent. The sampler is modular for easy servicing in the field and its operation can be checked via radiotelemetry. The sampler, designed to meet Environmental Protection Agency (EPA) requirements for PM-10 sampling, is currently being characterized in EPA's laboratories at Research Triangle Park, North Carolina.

25877 (SAND-92-2296C) **Cross borehole electromagnetic imaging of chemical and mixed waste landfills.** Borns, D.J. (Sandia National Labs., Albuquerque, NM (United States)); Newman, G.; Stolarczyk, L.; Mondt, W. Sandia National Labs., Albuquerque, NM (United States). [1992]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9304109--4: SAGEEP '93: symposium on the application of geophysics to environmental and engineering problems, San Diego, CA (United States), 18-21 Apr 1993). Order Number DE93011684. Source: OSTI; NTIS; INIS; GPO Dep.

The Mixed Waste Landfill Integrated Demonstration (MWLID) is testing noninvasive site characterization methods at several locations, including the Chemical Waste Landfill (CWL) at Sandia National Laboratories. The CWL comprises shallow, unlined pits that were used for the disposal of acids, oils, solvents, and inorganic compounds from 1962 until the CWL was closed in 1985. The soils of the landfills are alluvial, predominantly sand, gravels and cobbles with small quantities of silts and clays. The focus of this study is an unlined chromic acid pit (UCAP). The UCAP pit is rectangular (approximately 4 × 10 m), which reportedly received unknown volumes of chromium in the form of chromic acid (liquid) and other hazardous materials. At this location, we have demonstrated a continuous waveform (CW) system for site characterization. During this year, we will also utilize a crossborehole pulsed radar system. Both methods are sensitive to variations in either electrical conductivity or dielectric constant in the soils or host rock at a waste site. These earth properties are some of the most responsive geophysical indicators of metallic, acidic and water-based subsurface contaminants.

25878 (SAND-93-0463C) **Fire accident analysis modeling in support of non-reactor nuclear facilities at Sandia National Laboratories.** Restrepo, L.F. Sandia National Labs., Albuquerque, NM (United States). [1993]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9306143--4: Energy Facility Contractors Group safety analysis meeting, Denver, CO (United States), 16-18 Jun 1993). Order Number DE93015123. Source: OSTI; NTIS; GPO Dep.

The Department of Energy (DOE) requires that fire hazard analyses (FHAs) be conducted for all nuclear and new facilities, with results for the latter incorporated into Title I design. For those facilities requiring safety analysis documentation, the FHA shall be documented in the Safety Analysis Reports (SARs). This paper provides an overview of the methodologies and codes being used to support FHAs at Sandia facilities, with emphasis on SARs.

25879 (UCRL-ID-104857) **Creep of clad irradiation as an uncertainty in criticality safety margins that include the effects of burnup for pressurized water reactor fuel assemblies.** Carlson, R.W.; Fischer, L.E. Lawrence Livermore National Lab., CA (United States). Sep 1990. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93012384. Source: OSTI; NTIS; INIS; GPO Dep.

The uncertainties that must be associated with the effects of burnup when predicting the criticality safety margin of a spent fuel transport or storage cask must include allowances for phenomena that are not included in the prediction of the effects of burnup. One such phenomena is the creep of the clad during irradiation of fuel rods, which reduces the diameter of the clad as burnup progresses. The fuel management analyses of a power reactor are based upon unit cell calculations of the neutron spectrum that do not typically include reduction in the diameter of the clad due to creep. The analyses presented here evaluate the magnitude of the effects of creep and conclude that an uncertainty of 0.3% ($\delta k/k$) should be assigned to the effects of creep. This uncertainty should be included with the other uncertainties to allow for the increase in the effective multiplication factor of a spent fuel cask that results from the changes in the isotopic inventories of uranium and plutonium in the fuel due to the effects of creep.

25880 (UCRL-JC-110983) **Guidelines for the development of natural phenomena hazards design criteria for surface facilities.** Nelson, T.A.; Hossain, Q.A.; Murray, R.C. Lawrence Livermore National Lab., CA (United States). 25 Jun 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920866--6: American Society of Civil Engineers (ASCE) symposium on dynamic analysis and design considerations, for high-level nuclear waste repositories, San Francisco, CA (United States), 19-20 Aug 1992). Order Number DE93012500. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses the rationale behind the guidelines, criteria, and methodologies that are currently used for natural phenomena hazard design and evaluation of DOE nuclear and non-nuclear facilities. The bases for the performance goals and usage categories specified in UCRL-15910 are examined, and the sources of intentional conservatism in the analyses, design, and evaluation methods and criteria are identified. Outlines of recent developments/changes in DOE Orders related to Natural Phenomena hazard mitigation are also presented. Finally, the authors recommend the use of DOE methodologies as embodied in UCRL-15910

for design and evaluation of surface facilities of the high level nuclear waste repository site.

25881 (WHC-SA–1706) **Case study: Managing potentially contaminated records.** Sprouse, B.S. Westinghouse Hanford Co., Richland, WA (United States). Jun 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9306156–1: Records management conference: ARMA material, Seattle, WA (United States), 14-17 Jun 1993). Order Number DE93016226. Source: OSTI; NTIS; INIS; GPO Dep.

For the past 10 or more years, Analytical Laboratory data cards have been generated and stored in the 222-S Laboratory at the Hanford Site in Richland, Washington. These cards are classified as record material and require retention for a minimum of 75 years in an approved storage facility in accordance with Westinghouse Hanford Company procedures. The cards are maintained in records boxes in the attic of the 222-S Laboratory and are subject to potential risk and loss. The most significant potential risks are radiological hazards. Various options are available for removal, cataloging, transmittal, and storage of these long-term records. Because the records are currently stored in a radiation protection zone, they surveyed before being released from the facility. This survey can be arduous and time consuming. Resolutions to the problem of removal and proper storage of the records from the facility need to be addressed. The records were reviewed and inventoried to determine the quantity of information. A study of the various options available was conducted, and based on the information collected, it was determined that the most feasible and cost-effective approach is to microfilm the cards inside the laboratory. This option complies with all applicable company requirements and decreases the estimated radiological survey time from approximately 3.5 years to under 40 hours. This activity will result in a potential savings of $350,000 over the life of the activity.

25882 (WHC-SA–1831) **Preliminary standard review guide for Environmental Restoration/Decontamination and Decommissioning safety analyses.** Ellingson, D.R. Westinghouse Hanford Co., Richland, WA (United States). Jun 1993. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9306143–13: Energy Facility Contractors Group safety analysis meeting, Denver, CO (United States), 16-18 Jun 1993). Order Number DE93016348. Source: OSTI; NTIS; INIS; GPO Dep.

The review guide is based on the shared experiences, approaches, and philosophies of the Environmental Restoration/ Decontamination and Decommissioning (ER/D&D) subgroup members. It is presented in the form of a review guide to maximize the benefit to both the safety analyses practitioner and reviewer. The guide focuses on those challenges that tend to be unique to ER/ D&D cleanup activities. Some of these experiences, approaches, and philosophies may find application or be beneficial to a broader spectrum of activities such as terminal cleanout or even new operations. Challenges unique to ER/D&D activities include (1) consent agreements requiring activity startup on designated dates; (2) the increased uncertainty of specific hazards; and (3) the highly variable activities covered under the broad category of ER/D&D. These unique challenges are in addition to the challenges encountered in all activities; e.g., new and changing requirements and multiple interpretations. The experiences in approaches, methods, and solutions to the challenges are documented from the practitioner and reviewer's perspective, thereby providing the viewpoints on why a direction was taken and the concerns expressed. Site cleanup consent agreements with predetermined dates for restoration activity startup add the dimension of imposed punitive actions for failure to meet the date. Approval of the safety analysis is a prerequisite to startup. Actions that increase expediency are (1) assuring activity safety; (2) documenting that assurance; and (3) acquiring the necessary approvals. These actions increase the timeliness of startup and decrease the potential for punitive action. Improvement in expediency has been achieved by using safety analysis techniques to provide input to the line management decision process rather than as a review of line management decisions. Expediency is also improved by sharing the safety input and resultant decisions with reviewers and regulators.

25883 (WHC-SA–1839) **Performance audit.** Brisbin, S.A. Westinghouse Hanford Co., Richland, WA (United States). Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9309139–1: 20. annual National Energy and Environmental Quality Division conference, Indian Wells, CA (United States), 19-22 Sep 1993). Order Number DE93012614. Source: OSTI; NTIS; GPO Dep.

In today's environmental world, there are essentially two different types of audits: systems audits and performance audits. Performance audits can be used to evaluate precision and accuracy of the total measurement system. The Westinghouse Hanford Company Restoration and Remediation Quality Assurance group conducts performance audits to quantitatively determine the precision and accuracy associated with analytical laboratory data and the comparability of data generated by two different laboratories. This paper explains the methods employed in conducting performance audits at Westinghouse Hanford Company.

25884 (WSRC-MS–92-477-Rev.1) **Risk assessment for nuclear processes at the Savannah River Site: Revision 1.** Durant, W.S. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930601–18-Rev.1: American Nuclear Society (ANS) annual meeting, San Diego, CA (United States), 20-24 Jun 1993). Order Number DE93013580. Source: OSTI; NTIS; INIS; GPO Dep.

The Savannah River Site, one of the US Department of Energy's nuclear materials processing facilities, has for many years conducted risk-based safety analyses for the nuclear processes conducted at the facilities. This approach has allowed comparisons of risks to established criteria for acceptability. When the risk-based program was begun, it was evident that its success would depend upon having a compilation of data that was site specific. The decision was made to create a data bank of undesirable events that had occurred at the site's nuclear fuel reprocessing facilities. From this modest beginning, five data banks have been created for nuclear fuel reprocessing, waste management, nuclear fuel fabrication, tritium operations, and the Savannah River Technology Center. In addition to the primary purpose of providing a sound basis for risk-based safety analyses, these highly versatile data banks are routinely used for equipment breakdown histories, incident investigations, design studies, project justifications, reliability studies, process problem solving, training, and audits.

25885 (WSRC-TR–93-008) **Demonstration of a utility industry horizontal drilling system: Horizontal well AMH-5 installation report.** Westinghouse Savannah River Co., Aiken, SC (United States). 31 Dec 1992. 168p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93016240. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy's Office of Technology Development initiated an integrated demonstration of innovative technologies and systems for cleanup of VOCs in soils and groundwater at the Savannah River Site (SRS) in 1989. The overall goal of the program is demonstration of multiple technologies and systems in the fields of drilling, characterization, monitoring, and remediation at a single test bed. Innovative technologies are compared to one another and to baseline technologies in terms of technical performance and cost effectiveness. Transfer of successfully demonstrated technologies and systems to DOE environmental restoration organizations, to other government agencies, and to industry is a critical part of the program. Directional drilling has been shown to be a successful technique for enhancing access to the subsurface, thus improving remediation systems, especially remediation systems which perform in situ. Demonstration of an innovative directional drilling system at the Integrated Demonstration Site at the SRS, was initiated in June of 1992. The directional drilling system was designed to install an in situ remediation system. The drilling system is an experimental compaction/dry drilling technique developed by Charles Machine Works (Ditch Witch®) of Perry, Oklahoma. A horizontal well was installed in the M Area of the SRS below and parallel to an abandoned tile process sewer line. The installation of the horizontal well was a two-part process. Part one consisted of drilling the borehole, and part two was the horizontal well completion.

25886 (WSRC-TR–93-102) **Savannah River Site disaggregated seismic spectra.** Stephenson, D.E. Westinghouse Savannah River Co., Aiken, SC (United States). Feb 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93016174. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this technical note is to characterize seismic ground motion at the Savannah River Site (SRS) by postulated earthquakes that may impact facilities at the site. This task is accomplished by reviewing the deterministic and probabilistic assessments of the seismic hazard to establish the earthquakes that control the hazard to establish the earthquakes that control the hazard at the site and then evaluate the associated seismic ground motions in terms of response spectra. For engineering design criteria of earthquake-resistant structures, response spectra serve the function of characterizing ground motions as a function of period or frequency. These motions then provide the input parameters that are used in the analysis of structural response. Because they use the maximum response, the response spectra are an inherently conservative design tool. Response spectra are described in terms of amplitude, duration, and frequency content, and these are related to source parameters, travel path, and site conditions. Studies by a number of investigators have shown by statistical analysis that for different magnitudes the response spectrum values are different for differing periods. These facts support Jennings' position that using different shapes of design spectra for earthquakes of different magnitudes and travel paths is a better practice than employing a single, general-purpose shape. All seismic ground motion characterization results indicate that the PGA is controlled by a local event with $M_w < 6$ and $R < 30$km. The results also show that lower frequencies are controlled by a larger, more distant event, typically the Charleston source. The PGA of 0.2 g, based originally on the Blume study, is consistent with LLNL report UCRL-15910 (1990) and with the DOE position on LLNL/EPRI.

25887 (DOE/IG–0323) **Review of DOE's personnel security clearance program.** USDOE Office of Inspector General, Washington, DC (United States). Capital Regional Audit Office. 31 Mar 1993. 30p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

Report to the Secretary.

The purpose of this review of the Department of Energy's personnel security program was to determine whether progress had been made in correcting long-standing problems in the program. These problems, as reported earlier, have included issuing too many clearances, granting clearances at too high a level, and not terminating clearances that were no longer needed. Other issues needing corrective action were those relating to slow processing of initial clearances and large reinvestigation backlogs.

25888 (ENEA-RT-NUCL–91-11) **Moisture effects on high level coincidence counter assays of mixed uranium/plutonium oxide.** Stewart, J.E.; Aparo, M.; Zeppa, P.; Troiani, F. Los Alamos National Lab., NM (United States); ENEA, Casaccia (Italy). Area Nucleare; ENEA, Saluggia (Italy). Centro Ricerche Energia. Aug 1991. 28p. (RT/NUCL–91-11). Order Number DE93799290. Source: OSTI; NTIS (US Sales Only); INIS.

The passive neutron coincidence technique is currently used for nondestructive assays of plutonium samples. This technique is based on the measurement of time-correlated neutrons emitted in the spontaneous fission of the even mass number plutonium isotopes. Passive neutron coincidence counting is capable of 1 per cent assay accuracy for pure, well-characterized PuO_2 and MOX samples that contain plutonium masses from a few tens of grams to several kilograms. Unknown amounts of moisture can be present in bulk plutonium samples, due to its hygroscopic characteristics. Such moisture can significantly bias the measurements. The purpose of this work was to establish experimentally and quantitatively the effects of entrained sample moisture on HLNCC assays of MOX samples and to test and calibrate two prototype detectors, developed by Los Alamos National Laboratory, for measuring the amount of moisture in MOX and PuO_2 samples. Further more, a simple system, called PANDA (PAssive Neutron Analyser) used at UMCP facility in order to reduce the burden on the analytical laboratory and to meet the requirements of nuclear material accountability in the balance area, was employed. Results of the experiments established the feasibility of using differential neutron moderation ratios to establish moisture levels in small MOX samples. A procedure for moisture corrections in HLNCC assays was validated experimentally.

25889 (ENEA-RT-NUCL–92-08) **Experience of ENEA in measuring volume and/or mass of input solutions needs for further R&D.** Dionisi, M. ENEA, Casaccia (Italy). May 1992. 18p. (CONF-9203262–1: R&D on volume and mass measurements in liquids, Ispra (Italy), 25-27 Mar 1992; RT/NUCL–92-08). Order Number DE93799246. Source: OSTI; NTIS (US Sales Only); INIS.

Solution volume and mass measurements are an essential component of any system to control and account for nuclear materials that are processed or stored in a liquid medium, both from the operators and the safeguards authorities points of view. ENEA (Italian Agency for Energy, New Technologies and the Environment) engaged a comprehensive R&D programme and, in cooperation with national and international organizations, undertook theoretical and experimental studies on tank volume calibration and measurements in order to fill the recognized technological gap. The ENEA activities included: theoretical and experimental studies; development of an improved time domain reflectometer system for solution level measurement in an accountability tank; in-field testing of tracer techniques for volume and mass determination in accountability tanks. This report presents the experience of ENEA in the field of R&D on solution volume and mass determination; gives impressions and judgements over the state-of-the-art and of practice of these measurements; and provides suggestions on what could and/or must be improved, indicating further R&D activities.

25890 (ETDE-IT–93-179) **Problem dependent nuclear data libraries in activation and dose calculations for 'RB-3' reactor decommissioning.** Cepraga, D.G.; Menapace, E.; Vanossi, A. ENEA, Bologna (Italy). 1992. 4p. (CONF-9209243–2: Advisory group meeting on nuclear data requirements for fission reactor decommissioning, Vienna (Austria), 7-11 Sep 1992). Order Number DE93799266. Source: OSTI; NTIS (US Sales Only); INIS.

In reactor decommissionig (i.e., the process following the final shutdown of the reactor by which radioactive components and materials are removed from the reactor site), a major factor to be taken into account in the methodology is to estimate the radioactive inventory and radiation sources (i.e., the quantities of radioactive materials that may be released into the environment and the resulting doses to the public). A method used for the radioactive inventory calculation and dose evaluation of the CIRENE fuel clusters and ECO fuel elements irradiated in the RB-3 reactor is discussed in this paper with particular regard to the processed problem-dependent nuclear data libraries. A complex sequence of various codes (in particular WIMS-D for flux-weighted spectrum, then flux weight factors calculations) is applied, via the COUPLE code, to update the ORIGEN Library. SCALE-4 modules such as ORIGEN - NITAWL - XSDRNPM - XSDOSE are used to produce problem-dependent processed data libraries needed to perform the depletion and shielding analysis. This sequence involves the systems analysis with associated data processing.

25891 (LA-UR–93-1304) **Statistics applied to safeguards.** Picard, R.R. Los Alamos National Lab., NM (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9305190–1: SSAC conference, Santa Fe, NM (United States), 10-14 May 1993). Order Number DE93012644. Source: OSTI; NTIS; GPO Dep.

Statistical methods are central to safeguards work. Measurements forming the basis of much materials accountancy are not perfect - "perfect" in the sense of being error free. Other sessions in this course address the destructive and nondestructive measurement of nuclear material, together with the inherent limitations in those measurements. The bottom line is that measurement errors are a fact of life and, since we can't eliminate them, we have to find a rational way to deal with them. Which leads to the world of

statistics. Beyond dealing with measurement errors, another area of statistical application involves the sampling of items for verification. Inspectors from the IAEA and domestic regulatory agencies periodically visit operating facilities and make measurements of selected items. By comparing their own measured values to those declared by the facilities, increased confidence is obtained. If verification measurements were not expensive, time consuming, and disruptive to operations, perhaps verification of 100% of the inventories would be desirable. In reality, many constraints lead to inspection of only a portion of those inventories. Drawing inferences about a larger "population" of declared items in a facility based on verification information obtained from a sample of those items is a statistical problem. There are few texts on statistics in safeguards. The lengthy exposition "IAEA Safeguards: Statistical Concepts and Techniques" and the US NRC book edited by Bowen and Bennet are two good sources of general information. In the next section, the subject of measurement quality is addressed. The third section covers the evaluation of MUFs, and discusses the related subjects of error propagation and sequential analysis. The final section covers verification, inspection sample size calculations, and the D statistic. The text is written at an elementary level, with references to the safeguards literature for more detailed treatment.

25892 (LA-UR–93-1368) **Fuzzy risk analysis for nuclear safeguards.** Zardecki, A. Los Alamos National Lab., NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930784–1: 5. international Fuzzy Systems Association World Congress, Seoul (Korea, Republic of), 4-9 Jul 1993). Order Number DE93012684. Source: OSTI; NTIS; GPO Dep.

Analysis of a safeguards system, based on the notion of fuzzy sets and linguistic variables, concerns such as complexity and inherent imprecision in estimating the possibility of loss or compromise. The automated risk analysis allows the risk to be determined for an entire system based on estimates for lowest level components and the component proportion. In addition, for each component (asset) the most effective combination of protection mechanisms against a given set of threats is determined. A distinction between bar and featured risk is made.

25893 (LA-UR–93-1669) **Evaluation of three new technologies for international safeguards.** Stanbro, W.D.; Rodriguez, C.A.; Olinger, C.T.; Cremers, T.L. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930533–7: 15. annual symposium of the European Safeguards Research and Development Association: safeguards and nuclear materials management, Rome (Italy), 11-13 May 1993). Order Number DE93014615. Source: OSTI; NTIS; GPO Dep.

Los Alamos National Laboratory is examining a number of promising technologies that could increase the effectiveness and efficiency of international nuclear safeguards. The techniques described in this paper include video image processing, infrared imaging, and acoustic resonance spectroscopy. Each of these techniques offers unique advantages in the implementation of an inspection regime.

25894 (LA-UR–93-1728) **Recent miniature MCA technology developments at Los Alamos.** Halbig, J.K. (Los Alamos National Lab., NM (United States)); Klosterbuer, S.F.; Russo, P.A.; Sprinkel, J.K.; Stephens, M.M.; Wiig, L.G.; Ianakiev, K.D. Los Alamos National Lab., NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930533–5: 15. annual symposium of the European Safeguards Research and Development Association: safeguards and nuclear materials management, Rome (Italy), 11-13 May 1993). Order Number DE93014578. Source: OSTI; NTIS; GPO Dep.

We have developed a new spectroscopy-grade 4096-channel multichannel analyzer (MCA) for use in the domestic nuclear industry with application in domestic and international nuclear safeguards. It is based on a building-block philosophy (hardware and software). The oversized "blind" prototype for the miniature and modular MCA fits in a box 10 by 20 by 9 cm including bias supply and batteries. Its low power consumption is a third unique feature. Our goal is to provide MCA hardware and software building blocks that people not technically knowledgeable of the internal details can use to build solutions to a wide variety of problems independent of computer platform or operating system.

25895 (LA-UR–93-1818) **Nuclear materials control technology in the post-cold war world: Radiation-based methods and information management systems.** Tape, J.W.; Eccleston, G.W.; Ensslin, N.; Markin, J.T. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930913–2: Global '93: future nuclear systems - emerging fuel cycles and waste disposal options, Seattle, WA (United States), 12-17 Sep 1993). Order Number DE93014556. Source: OSTI; NTIS; INIS; GPO Dep.

The end of the cold war is providing both opportunities and requirements for improving the control of nuclear materials around the world. The dismantlement of nuclear weapons and the growth of nuclear power, including the use of plutonium in light water reactors and breeder reactor programs, coupled with enhanced proliferation concerns, drive the need for improved nuclear materials control. We describe nuclear materials control and the role of technology in making controls more effective and efficient. The current use and anticipated development in selected radiation-based methods and related information management systems am described briefly.

25896 **Integrated optical tamper sensor.** Carson, R.F.; Casalnuovo, S.A. To Dept. of Energy. 1991. Filed date 6 Jun 1991. USA patent application 7-711,235. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93015705. Source: OSTI; NTIS; GPO Dep.

This invention consists of an monolithic optical tamper sensor, comprising an optical emitter and detector, connected by an optical waveguide and placed into the critical entry plane of an enclosed sensitive region, the tamper sensor having a myriad of scraps of a material optically absorbent at the wavelength of interest, such that when the absorbent material is in place on the waveguide, an unique optical signature can be recorded, but when entry is attempted into the enclosed sensitive region, the scraps of absorbent material will be displaced and the optical/electrical signature of the tamper sensor will change and that change can be recorded.

25897 (SAND–92-2782C) **Tactical Automated Security System (TASS).** Christiansen, M.L.; Madsen, R.W.; Gangel, D.J. Sandia National Labs., Albuquerque, NM (United States). [1993]. 15p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. MOU DE-AI04-79AL11812. (CONF-9305110–3: Expo 93, Oak Ridge, TN (United States), May 1993). Order Number DE93013762. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Tactical Automated Security System (TASS) Program is a US Air Force funded program to develop rapidly deployable security systems for tactical, portable, and semipermanent applications. With the changing world military posture of declining manpower, base and asset relocation, and limited funding, the demand for easily transportable and relocatable security systems for asset protection and temporary perimeter security is increasing. This new philosophy of rapid response with relocatable security equipment is not limited to military organizations but spans almost all government and private organizations concerned with remote monitoring of activities or sensitive assets. The experience gained by Sandia National Laboratories in over 30 years of developing and implementing security systems for the protection of nuclear weapons and resources at fixed nuclear facilities is now being applied to the development and application of tactical, portable, and semipermanent security systems. This paper summarizes the objectives, accomplishments, and status of two related Air Force programs: TASS and Relocatable Sensors. The Relocatable Sensors program is a predecessor to, and subset of, TASS and has resulted in the deployment and operation of portable and semipermanent sensor systems at several US Air Force facilities. TASS is a new program that is developing concepts, requirements, and hardware for future rapid deployment security needs within the Air Force and other government agencies. This paper describes the TASS equipment, which includes relocatable sensors, graphics-based and hand-held annunciators, wireless communication links, assessment devices (Closed Circuit Television cameras and thermal imagers), and portable power subsystems. These components and subsystems

are being prototyped and tested and will be integrated into low-cost rapidly deployable TASS security systems to meet the diverse needs of the Air Force and other government organizations.

25898 (SAND–93-0442C) **Sandia Access Delay Technology Program.** Linker, K.L.; Plugge, M.M. Sandia National Labs., Albuquerque, NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9306180–1: 9. annual joint Government-Industry symposium on security technology, Virginia Beach, VA (United States), 21-24 Jun 1993). Order Number DE93015648. Source: OSTI; NTIS; INIS; GPO Dep.

Sandia National Laboratories (SNL) has been involved in security systems development and application for approximately twenty years. This involvement has included the development of physical security system elements such as detection, assessment, access delay, and response. SNL has continued to be very active in access delay design, development, and application including fixed barriers, deployable barriers, and activated dispensables. Access delay is becoming increasingly important in physical security systems designs as threat capabilities increase and security personnel operational costs escalate. SNL is presently developing two access delay systems incorporating multiple access delay features. The first is the Intra- site Secure Transport Vehicle (ISTV) which is being developed to address security and safety vulnerabilities during transportation. The second is a Rapid Deployment Access Delay System (RAPADS) that provides enhanced security for temporary storage or contingency operations. This paper includes a brief history of SNL involvement in access delay hardware development and the basic design features and capabilities of the ISTV and RAPADS.

0560 Legislation and Regulations

25899 (DOE/CH/10324–T4) **State alternative route designations.** Southern States Energy Board, Norcross, GA (United States). Jul 1989. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-87CH10324. Order Number DE93016300. Source: OSTI; NTIS; INIS; GPO Dep.

Pursuant to the Hazardous Materials Transportation Act (HMTA), the Department of Transportation (DOT) has promulgated a comprehensive set of regulations regarding the highway transportation of high-level radioactive materials. These regulations, under HM-164 and HM-164A, establish interstate highways as the preferred routes for the transportation of radioactive materials within and through the states. The regulations also provide a methodology by which a state may select alternative routes. First,the state must establish a "state routing agency," defined as an entity authorized to use the state legal process to impose routing requirements on carriers of radioactive material (49 CFR 171.8). Once identified, the state routing agency must select routes in accordance with Large Quantity Shipments of Radioactive Materials or an equivalent routing analysis. Adjoining states and localities should be consulted on the impact of proposed alternative routes as a prerequisite of final route selection. Lastly, the states must provide written notice of DOT of any alternative route designation before the routes are deemed effective.

25900 (DOE/EH–0323) **RCRA corrective action program guide (Interim).** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). RCRA/CERCLA Div. May 1993. 539p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93015124. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy (DOE) is responsible for compliance with an increasingly complex spectrum of environmental regulations. One of the most complex programs is the corrective action program proposed by the US Environmental Protection Agency (EPA) under the authority of the Resource Conservation and Recovery Act (RCRA) as amended by the Hazardous and Solid Waste Amendments (HSWA). The proposed regulations were published on July 27, 1990. The proposed Subpart S rule creates a comprehensive program for investigating and remediating releases of hazardous wastes and hazardous waste constituents from solid waste management units (SWMUs) at facilities permitted to treat, store, or dispose of hazardous wastes. This proposed rule directly impacts many DOE facilities which conduct such activities. This guidance document explains the entire RCRA Corrective Action process as outlined by the proposed Subpart S rule, and provides guidance intended to assist those persons responsible for implementing RCRA Corrective Action at DOE facilities.

25901 (IAEA-TECDOC–696, pp. 63-66) **Principles of the Codex general standard for irradiated foods and associated code of practice.** Ladomery, L.G. (Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria)). World Health Organization, Manila (Philippines). Regional Office for the Western Pacific; Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Mar 1993. (CONF-9201151–: WHO/IAEA/FAO seminar on harmonization of regulations on food irradiation in Asia and the Pacific, Kuala Lumpur (Malaysia), 20-24 Jan 1992). In *Harmonization of regulations on food irradiation in Asia and the Pacific: Proceedings of a seminar held in Kuala Lumpur, Malaysia, 20-24 January 1992.* [211p.] Order Number DE93629035. Source: OSTI; NTIS (US Sales Only); INIS.

The Codex Alimentarius Commission, which is the Executive Organ of the Joint FAO/WHO Food Standards Programme, adopted in 1983 a General Standard for Irradiated Foods and a Recommended International Code of Practice for the Operation of Radiation Facilities used for the Treatment of Foods. The Standard takes into account the conclusions of Joint FAO/IAEA/WHO Expert Committees, convened to evaluate all available data concerning the effects of irradiation treatment on food, including extensive wholesomeness data and animal tests. The Standard represents a set of principles and requirements for the process and for the irradiated product. It does not go into details concerning the application of food irradiation to individual food products on groups of food products in accordance with good irradiation practice. Such details are covered in a special Codes of Good Irradiation Practice elaborated by the FAO/IAEA/WHO International Consultative Group on Food Irradiation. The lecture will describe the various provisions of the Codex Standard for Irradiated Foods and the Code and provide explanation of the intent of these provisions, drawing attention to the actual practices followed by Governments in regulating food irradiation. (author). 12 refs.

25902 (INIS-mf–12758, pp. 499-503) **New regulatory aspects of UF_6 transport.** Biaggio, A.L. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Seguridad Radiologica y Nuclear); Lee Gonzales, H.M.; Lopez Vietri, J.R.; Novo, R.G. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

In nuclear industry, a great amount of uranium is transformed from a chemical form to another. When the fuel cycle requires enrichment, uranium hexafluoride (UF 6) is handled, stored and transported in great quantities. To analyze the risks involved in possible accidents associated with UF_6, radiological and chemical aspects must be considered. So far, the international practice was based on the adoption of regulations from a particular country (ANSI No. 14.1-1982.U.S.A.). In this way, the adoption of these norms at international level is difficult. For that reason, the International Atomic Energy Agency has attempted to consider the chemical risks associated with UF_6 in order to establish a more universal basis ('Recommendations for Providing Protection during the Transport of Uranium Hexafluoride' IAEA-TECDOC-423, Vienna, June 1987 - Austria). A critical analysis of these recommendations is presented in this work. The coherence and the degree of completion of the new recommendations are evaluated and the safety level is compared with that of the accepted regulations for toxic or corrosive substances and for radioactive materials transport. (Author).

25903 (INIS-mf–13543, pp. 33-52) **Anti-radon provisions by Building Offices.** Ondrejechova, V. (Ministerstvo Zivotniho Prostredi CR, Praha (Czechoslovakia)). Ministerstvo Zivotniho Prostredi, Prague (Czech Republic); Okresni Urad, Jihlava (Czech Republic); Dum Kultury Odboru, Jihlava (Czech Republic). 1992. (In Czech). (CONF-9211241–: Conference on provisions against radon, Jihlava (Czech Republic), 23-25 Nov 1992). In *Conference on provisions against radon: Proceedings.* [232p.] Order Number DE93629294. Source: OSTI; NTIS (US Sales Only); INIS.

The Czech Ministry of Finance has issued regulations concerning financial contributions by the government to anti-radon provisions in homes. The Ministry also issued an instruction concerning homes made of building materials for the manufacture of which state enterprises employed power plant slag containing radioactive elements; such homes can be bought out by the state. Building Offices in the Czech Republic are state authorities assessing and issuing permits for the construction, reconstruction or demolition of any building. The responsibilities of the Building Offices in territorial planning, territorial proceedings, building proceedings and approvals, etc., are outlined. An overview of applicable legislation is given. (M.D.).

25904 (CONF-930304–25) **Radioisotope production at Oak Ridge National Laboratory–past, present, and future.** Collins, E.D.; Alexander, C.W.; Bigelow, J.E.; Ottinger, C.L. Oak Ridge National Lab., TN (United States). [1993]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 205. American Chemical Society national meeting; Denver, CO (United States); 28 Mar - 2 apr 1993. Order Number DE93015438. Source: OSTI; NTIS; GPO Dep.

Radioisotopes of significant value to research, medicine, and industry have been successfully produced at ORNL for many years, using a variety of reactors and hot cell facilities. Plans are for continued production. The ANS and Melton Valley facilities are planned for 21st century operation. Significant issues must be resolved to enable continued operation: stabilized and sufficient funding; appropriate regulation of facility operation and transportation of radioactive materials; and integrated planning and provision for waste treatment, storage, and disposal. 6 figs, 2 tabs.

25905 (DPSP–55-454-4) **Savannah River Plant history, GS Area, July 1954–December 1972.** Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Plant. Apr 1973. 277p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–530). Order Number DE93012424. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This volume contains a condensed survey of the yearly activities of the GS Area and the various Plant agencies which contributed to its operation. Only salient features of the area's operation are reviewed. Emphasis is placed on results obtained and reasons for actions taken rather than on process detail. The time period covered is July 1954 through December 1972.

25906 (INIS-mf–12758, pp. 461-465) **Operation of plant to produce Mo-99 from fission products.** Marques, R.O. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Radioisotopos y Radiaciones); Cristini, P.R.; Marziale, D.P.; Furnari, E.S.; Fernandez, H.O. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

As it is well known, the production of Mo-99/Tc-99m generators has an outstanding place in radioisotope programs of the Argentine National Atomic Energy Commission. The basic raw material is Mo-99 from fission of U-235. In 1985 the production plant of this radionuclide began to operate, according to an adaptation of the method that was developed in Kernforschungszentrum Karlsruhe. The present work describes the target irradiation conditions in the reactor RA-3 (mini plates of U/Al alloy with 90% enriched uranium), the flow diagram and the operative conditions of the production process. The containment, filtration and removal conditions of the generated fission gases and the disposal of liquid and solid wastes are also analyzed. On the basis of the experience achieved in the development of more than twenty production processes, process efficiency is analyzed, taking into account the theoretical evaluation resulting from the application of the computer program 'Origin'(ORML) to the conditions of our case. The purity characteristics of the final product are reported (Zr-95 0,1 ppm; Nb-95 1 ppm; Ru-103 20 ppm; I-131 10 ppm) as well as the chemical characteristics that make it suitable to be used in the production of Mo-99/I c-99m generators. (Author).

25907 (INIS-mf–12758, pp. 466-470) **Ruthenium-103 and molybdenum-99 impurities in successive elution s of Mo-99Tc-99m generators.** Rotta, M.C. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Radioisotopos y Radiaciones); Esposito, M.G.; Viirsoo, M.T. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

Chromatographic generators of Mo-99/Tc-99m for medical purposes are produced since 1975 by the National Atomic Energy Commission. Mo-99 was obtained as from 1985 through selective separation of fission products. In this way, generators of high specific activity and high activity are obtained. The generator elutions are tested for impurities by routine. The requirements of the National Argentine Pharmacopoeia are fulfilled in all cases. The determination of Mo-99 content is performed in an ionization chamber using for the elution a lead shield 7.5 mm thick. The other nuclides that can be present are analyzed by gamma spectrometry with solid state detector. In order to measure recent elutions a lead shield 5 mm thick is used for the sample to prevent the interference of Tc-99m (140.5 keV). Among the elution impurities, the highest content corresponds to Mo-99 and Ru-103. Its value has been studied by varying the number of elutions extracted from the generator. The elutions from 22 generators of 8 different lots of generators were analyzed. The elution frequency was 1-2 elutions/day. In some cases the follow-up period was 14 days. The determination of Ru-103 (T 1/2 39,26 days) was performed on decayed solutions in order to prevent the interference of Tc-99m (T 1/2 6,00 h) and Mo-99 (T 1/2 66,02 h) during the measurement. In all cases the ratio Mo-99/Tc-99m was almost constant while the values of Ru-103/Tc-99m ratio varied between 0.02 and 1.5 ppm. A progressive decrease was observed during the first week of use and an increase during the second week because the total activity of Ru-103 tends to be constant while that of Tc-99m decays. (Author).

25908 (SR/H–573) **Dana history start-up through December 31, 1952.** [Plant Histories]. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Plant. [1952]. 102p. The purpose of this report is to present an overall picture of DuPont's management of the Dana Plant. The period covered by this initial section ends December 31, 1952; continued work will be covered by additional sections issued on a year to year basis.

25909 (UCRL-JC–109276) **Design and performance of an automated video-based laser beam alignment system.** Rundle, W.J. (Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States)); Kartz, M.W.; Bliss, E.S.; English, R.E. Jr.; Peterson, R.L.; Thompson, G.R.; Uhlich, D.M. Lawrence Livermore National Lab., CA (United States). 14 Jul 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48.

(CONF-920792–57: Society of Photo-Optical Instrumentation Engineers (SPIE) international symposium on optical applied science and engineering, San Diego, CA (United States), 19-24 Jul 1992). Order Number DE93012571. Source: OSTI; NTIS; GPO Dep.

This paper describes the design and performance of an automated, closed-loop, laser beam alignment system. Its function is to sense a beam alignment error in a laser beam transport system and automatically steer mirrors preceding the sensor location as required to maintain beam alignment. The laser beam is sampled by an optomechanical package which uses video cameras to sense pointing and centering errors. The camera outputs are fed to an image processing module, which includes video digitizers and uses image storage and software to sense the centroid of the image. Signals are sent through a VMEbus to an "optical device controller" (ODC), which drives stepper-motor actuators on mirror mounts preceding the beam-sampling location to return the beam alignment to the prescribed condition. Photodiodes are also used to extend the control bandwidth beyond that which is achievable with video cameras. This system has been operated at LLNL in the Atomic Vapor Laser Isotope Separation (AVLIS) program to maintain the alignment of copper and dye laser beams, the latter to within ± 2 μr in pointing and less than 1 mm in centering. The optomechanical design of the instrumented package, which includes lens, mirror, and video mounts in a rigid housing, the automated control system architecture, and the performance of this equipment is described.

25910 (UCRL-JC–110875) **Design of a formaldehyde photodissociation process for carbon and oxygen isotope separation.** Stern, R.C.; Scheibner, K.F. Lawrence Livermore National Lab., CA (United States). 20 Jan 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930159–40: OE/LASE '93: International Society for Optical Engineering (SPIE) conference, Los Angeles, CA (United States), 16-23 Jan 1993). Order Number DE93016435. Source: OSTI; NTIS; INIS; GPO Dep.

The current shortage of ^{18}O has revived interest in using one step UV photodissociation of formaldehyde to enrich ^{13}C, ^{17}O and ^{18}O. The frequency doubled output of the copper laser pumped dye laser system currently in operation at LLNL can be used to drive this dissociation. The authors use a simple kinetics model and their experience with Atomic Vapor Laser Isotope Separation (AVLIS) process design to examine the relative merits of different designs for a formaldehyde photodissociation process. Given values for the molecular photoabsorption cross section, partition function, spectroscopic selectivity, collisional exchange and quenching cross sections (all as parameters), they perform a partial optimization in the space of illuminated area, formaldehyde pressure in each stage, and formaldehyde residence time in each stage. They examine the effect of cascade design (heads and tails staging) on molecule and photon utilization for each of the three isotope separation missions, and look in one case at the system's response to different ratios of laser to formaldehyde costs. Finally, they examine the relative cost of enrichment as a function of isotope and product assay. Emphasis is as much on the process design methodology, which is general, as on the specific application to formaldehyde.

25911 (UCRL-JC–111091) **Status of gadolinium enrichment technology at LLNL.** Haynam, C.; Comaskey, B.; Conway, J.; Eggert, J.; Glaser, J.; Ng, E.; Paisner, J.; Solarz, R.; Worden, E. Lawrence Livermore National Lab., CA (United States). Jan 1993. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930159–33: OE/LASE '93: International Society for Optical Engineering (SPIE) conference, Los Angeles, CA (United States), 16-23 Jan 1993). Order Number DE93014416. Source: OSTI; NTIS; GPO Dep.

A method based on,polarization selectivity and three step laser photoionization is presented for separation of the odd isotopes of gadolinium. Measurements of the spectroscopic parameters needed to quantify the excitation pathway are discussed. Model results are presented for the efficiency of photoionization. The vapor properties of electron beam vaporized gadolinium are presented which show dramatic cooling during the expansion of the hot dense vapor into a vacuum. This results in a significant increase in the efficiency of conversion of natural feed into enriched product in the AVLIS process. Production of enriched gadolinium for use in commercial power reactors appears to be economically viable using technology in use at LLNL.

25912 (WSRC-TR–92-552) **Materials performance in prototype Thermal Cycling Absorption Process (TCAP) columns.** Clark, E.A. Westinghouse Savannah River Co., Aiken, SC (United States). 21 Nov 1992. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014722. Source: OSTI; NTIS; INIS; GPO Dep.

Two prototype Thermal Cycling Absorption Process (TCAP) columns have been metallurgically examined after retirement, to determine the causes of failure and to evaluate the performance of the column container materials in this application. Leaking of the fluid heating and cooling subsystems caused retirement of both TCAP columns, not leaking of the main hydrogen-containing column. The aluminum block design TCAP column (AHL block TCAP) used in the Advanced Hydride Laboratory, Building 773-A, failed in one nitrogen inlet tube that was crimped during fabrication, which lead to fatigue crack growth in the tube and subsequent leaking of nitrogen from this tube. The Third Generation stainless steel design TCAP column (Third generation TCAP), operated in 773-A room C-061, failed in a braze joint between the freon heating and cooling tubes (made of copper) and the main stainless steel column. In both cases, stresses from thermal cycling and local constraint likely caused the nucleation and growth of fatigue cracks. No materials compatibility problems between palladium coated kieselguhr (the material contained in the TCAP column) and either aluminum or stainless steel column materials were observed. The aluminum-stainless steel transition junction appeared to be unaffected by service in the AHL block TCAP. Also, no evidence of cracking was observed in the AHL block TCAP in a location expected to experience the highest thermal shock fatigue in this design. It is important to limit thermal stresses caused by constraint in hydride systems designed to work by temperature variation, such as hydride storage beds and TCAP columns.

25913 (DOE/FTR–93012812) **[Travel to 8th international conference on ion beam modification of materials to present one unclassified paper and attend conference sessions]: Foreign trip report, September 5–12, 1992.** Weber, W.J. Pacific Northwest Lab., Richland, WA (United States). 29 Sep 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012812. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The conference highlighted the high-level of international research effort on ion-beam modification and processing of semiconductors, metals, intermetallics, ceramics, glasses, polymers, and high- temperature superconductors. There were 470 participants from 34 different countries. Although both basic and applied research were covered, it is clear that most current efforts are applications oriented.

25914 (ENEA-RT-INN–92-38) **Irradiation technology for cosmetics hygienization.** Adamo, M.; Musciagna, A. ENEA, Casaccia (Italy). Area Energia e Innovazione. Dec 1992. 86p. (In Italian). (RT/INN–92-38). Order Number DE93799288. Source: OSTI; NTIS (US Sales Only); INIS.

Italy occupies a leading position in the international cosmetics market; in 1990, sector sales were about $ 4 billion. The possible microbiological contamination of a cosmetics product can be due both to raw materials, which present usually a remarkable microbic load, and manufacturing process anomalies. Microbiological contamination can cause both skin pathologies and product spoilage. Preserving substances are used in order to prevent cosmetics microbiological contamination; however, these substances are not devoid of toxicological risk and can cause phenomena of skin sensitization. Irradiation technologies allow manufacturers to brilliantly resolve the problem of cosmetic products hygienization by a very effective, homogeneous treatment process, which is, moreover, exactly reproducible and easily controllable. These technologies, with the observance of good manufacturing practise and the execution

of checks, which are provided for in Italian and European legislation, in conformity with good manufacturing quality, allow manufacturers to achieve a cosmetics product of excellent quality.

25915 (LA-UR–93-1716) **Real-time spot size camera for pulsed high-energy radiographic machines.** Watson, S.A. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–110: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014583. Source: OSTI; NTIS; INIS; GPO Dep.

The focal spot size of an x-ray source is a critical parameter which degrades resolution in a flash radiograph. For best results, a small round focal spot is required. Therefore, a fast and accurate measurement of the spot size is highly desirable to facilitate machine tuning. This paper describes two systems developed for Los Alamos National Laboratory's Pulsed High-Energy Radiographic Machine Emitting X-rays (PHERMEX) facility. The first uses a CCD camera combined with high-brightness floors, while the second utilizes phosphor storage screens. Other techniques typically record only the line spread function on radiographic film, while systems in this paper measure the more general two-dimensional point-spread function and associated modulation transfer function in real time for shot-to-shot comparison.

25916 (LA-UR–93-1878) **A Los Alamos design study for a high-power spallation-neutron-source driver.** Jason, A.J.; Hardekopf, R.A.; Macek, R.W.; Schriber, S.O.; Thiessen, H.A.; Woods, R. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–116: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014472. Source: OSTI; NTIS; GPO Dep.

A design study for an accelerator-driven spallation-neutron source is underway at Los Alamos. The driver, based on the LAMPF facility, produces a 1-MW proton beam and is upgradable to 5 MW. After linear acceleration to full energy, an H-beam is accumulated for approximately I ms in a compressor ring and then extracted to produce an intense proton burst, less than 1 μs long, onto a spallation target system with a 60-Hz cycle rate. The design uses existing infrastructure insofar as possible while maintaining project goals. This paper summarizes the system specifications and design status.

25917 (LA-UR–93-1897) **Linac design study for an intense neutron-source driver.** Lynch, M.T.; Browman, A.; DeHaven, R.; Jameson, R.; Jason, A.; Neuschaefer, G.; Tallerico, P.; Regan, A. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–113: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014465. Source: OSTI; NTIS; INIS; GPO Dep.

The 1-MW spallation-neutron source under design study at Los Alamos is driven by a linac-compressor-ring scheme that utilizes a large portion of the existing Los Alamos Meson Physics Facility (LAMPF) linac, as well as the facility infrastructure. The project is referred to as the National Center for Neutron Research (NCNR). A second phase of the proposal will upgrade the driver power to 5 MW. A description of the 1-MW scheme is given in this paper. In addition, the upgrade path to the substantial increase of beam power required for the 5 MW scenario is discussed.

25918 (LRP–472/93) **Negative hydrogenated silicon ion clusters as particle precursors in RF silane plasma deposition experiments.** Howling, A.A. (Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP)); Sansonnens, L.; Dorier, J.L.; Hollenstein, C. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Mar 1993. [12p.] Order Number DE93629552. Source: OSTI; NTIS; INIS.

Stable negative ions containing up to sixteen silicon atoms have been measured by mass spectrometry in rf power-modulated silane plasmas for amorphous silicon deposition. These hydrogenated silicon cluster ions reach much higher masses than the positive ions, which have no more than six silicon atoms. This supports the view that negative ions are the precursors to particulate formation in silane plasmas. The time-dependent fluxes of positive and negative ions from the plasma are shown with a 5 μs time resolution. Possible cluster reaction sequences are discussed, and the effect of visible light on the negative ion signal is commented upon. (author) 3 figs., 24 refs.

25919 (OEFZS–4673) **Response of soil aggregate stability to storage time of soil samples.** Gerzabek, M.H. (Hauptabteilung Agrarforschung und Biotechnologie, Forschungszentrum Seibersdorf GmbH, Seibersdorf (Austria)); Roessner, H. Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Apr 1993. [8p.] (In German). Order Number DE93628203. Source: OSTI; NTIS (US Sales Only); INIS.

Reprint from Die Bodenkultur, Journal fuer landwirtschaftliche Forschung v. 44(1), Feb 1993.

The aim of the present study was to investigate the well known phenomenon of changing aggregate stability values as result of soil sample storage. In order to evaluate the impact of soil microbial activity, the soil sample was split into three subsamples. Two samples were sterilized by means of chloroform fumigation and gamma irradiation, respectively. However, the aggregate stability measurements at three different dates were not correlated with the microbial activity (dehydrogenase activity). The moisture content of the aggregate samples seems to be of higher significance. Samples with lower moisture content (range: 0.4 to 1.9%) exhibited higher aggregate stabilities. Thus, airdried aggregate samples without further treatment don't seem to be suitable for standardized stability measurements. (authors).

25920 (ORNL/FTR–4574) **[Travel to Japan to attend the fifth international symposium on advanced nuclear energy research and to visit the new research reactor JRR-3M]: Foreign trip report, March 9–12, 1993.** Hayter, J.B. Oak Ridge National Lab., TN (United States). 29 Mar 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011816. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Fifth International Symposium on Advanced Nuclear Energy Research was cosponsored by seven major Japanese professional Institutes and Societies. The symposium was subtitled "Neutrons as Microscopic Probes". It was based on twenty invited lectures from a group of international experts, covering most current uses of neutron research, and was followed by a round table discussion of future trends. The symposium, with about 350 attendees, was clearly intended to foster Japanese use of neutrons by academic, industrial, and government scientists and engineers. I was invited to lecture in "New Techniques on Neutron Scattering" and to be a panel member for the round table on "Future Research with Neutrons". There is intense interest in the Advanced Neutron Source (ANS) project and several officials of the Japan Atomic Energy Research Institute (JAERI) expressed interest in expanding their collaboration in the project. After the symposium I was able to visit the most modern Japanese neutron beam research reactor at the JAERI Tokai Research Establishment.

0703 Isotopic Power Supplies

25921 (DOE/NE/32140–22) **Follow-up investigations of GPHS motion during heat pulse intervals of reentries from gravity-assist trajectories: Aerospace Nuclear Safety Program.** Sharbaugh, R.C. Johns Hopkins Univ., Laurel, MD (United States). Applied Physics Lab. 23 Mar 1992. 274p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI01-88NE32140. (JHU/APL-ANSP-M–22). Order Number DE93013816. Source: OSTI; NTIS; INIS; GPO Dep.

Motion studies of the General Purpose Heat Source Module, GPHS, which were conducted in the heat pulse intervals associated with entries from earth gravity assist trajectories. The APL six-degree-of-freedom reentry program designated TMAGRA6C was used. The objectives of the studies were to (1) determine whether the GPHS module entering the earth's atmosphere from

an earth-gravity-assist trajectory has a preferred orientation during the heat pulse of reentry, (2) determine the effect of magnus force on the roll rate and angle of attack of the GPHS during an EGA entry, (3) determine the effect of the magnitude of pitch and roll damping on the GPHS motion.

This technical report presents the age-adjusted total, and race and sex specific geographic patterns of cancer mortality for South Carolina (SC) counties utilizing the 1953–1987 average annual age-adjusted mortality rates (AAMRs). The mortality information was obtained from the State Cancer Control Map and Data Program produced by the National Cancer Institute , Centers for Disease Control and the American Cancer Society. The AAMRs for selected primary sites are classified as significantly different or not significantly different from the corresponding United States and SC mortality rates. Categories for classification of the rates are determined using 95% confidence intervals. Geographic patterns of significantly high county AAMRs are identified and discussed. Individual county rates are not emphasized. The terminology, mortality rates used throughout this report pertains to the 1953–1987 AAMRS.

Many commercial food irradiation facilities use cobalt-60 as a source of gamma radiation. This article describes the manufacture and physical characteristics of cobalt-60 sources, and outlines the basic operation of cobalt-60 facilities. In routine use the environmental impact of such a plant is negligible. A series of potential accident scenarios is discussed, leading to the conclusion that cobalt-60 irradiation should be regarded as a very safe industrial activity.

EFP-91.

The aim was to investigate whether energy from one large hydroelectric power station could be used in several towns in Greenland by using hydrogen as a medium for energy storage so that this energy could be transported by sea. Other means of transport in Greenland would be very costly and are often technologically impossible. The primary idea was to establish a hydrogen-producing plant in the town of Nuuk on the basis of electricity from a hydroelectric power plant in Buksefjorden and the use of the hydrogen in power and heating plants in a number of towns on the west coast. The production of hydrogen would take place by the use of alkaline water electrolysis and the hydrogen would be stored and transported in liquid form. This involves cooling the hydrogen down to -235 degrees centigrade. Transport and storage would take place in highly insulated standard sized containers. A system analysis was carried out where hydrogen is illustrated as an alternative fuel to oil. It was concluded that it is technologically possible to introduce hydrogen as an energy carrier within the Greenlandic energy system. Hydrogen produced in connection with hydroelectric power is an environmentally-protective alternative to oil, but cannot compete economically, it would cost about five times as much. But hydrogen is interesting in the light of possible future export and as a medium for promoting greater use of Greenland's vast hydroelectric power potentials. (AB).

The technical and economic feasibility of biological water gas shift has been demonstrated during Phase I of the research program. Extended research is being conducted in Phase II to reduce the technology to practice. Phase II objectives include screening all available cultures for their ability to biocatalyze water gas shift, optimization of the chosen culture for growth and H_2 production, evaluation of the culture in various continuous reactors, evaluation of the suitability of advanced fermentation concepts including high pressure operation and non-aqueous phase fermentation, and process design and economic evaluations.

25926 (ETDE/JP-mf–93798908) **Prospect on new energies.: Hydrogen energy.** Institute of Applied Energy, Tokyo (Japan). Mar 1992. 30p. (In Japanese). Order Number DE93798908. Source: OSTI; NTIS; Available from The Institute of Applied Energy, 14-2, Nishishinbashi 1-chome, Minato-ku, Tokyo, Japan.

This paper reports surveys on hydrogen energy carried out by the General Energy Engineering Research Institute of Japan. Hydrogen energy is expected of being used for dealing with the global warming problem. The worldwide annual hydrogen demand was 238 billion Nm^3 in 1991 consumed in Oil refining and other utilizing areas, of which about 10% is accounted for by the Japanese demand. Using natural gas as a raw material is a practical way of manufacturing this clean energy in industrial scales. However, it is not desirable that the manufacturing process produces CO2. Hydrogen manufacturing methods are various, including partial oxidation, coal gasification, steam-iron reaction, salt electrolysis, by-production in oil refining, and methanol reformation. Future interest is addressed to water electrolysis which does not depend on fossil fuels. One of the problems in developing hydrogen fueled vehicles is in a simple liquid hydrogen filling device which may need measures to handle NOx generation. Solar beam power generation would be used in much larger scales in the 21st century,

where a conceivable problem will be means for temporary storage and transportation of the energy. 3 refs., 2 figs., 4 tabs.

Contract TY73501A. Order Number DE93016385. Source: OSTI; NTIS; GPO Dep.

The southeastern region of the United States can produce approximately the annual equivalent of 897 trillion Btu of energy from nonforestry wastes such as agriculture crop residues, animal excreta from confined feedlots, craps that could be grown on agricultural set-aside land, municipal solid wastes, and sewage sludge. This study developed county-level data for these resources.

25941 (VF-UB–93-9) **Biomass production in poplar plantations.** Telenius, B. (Swedish Univ. of Agricultural Sciences, Uppsala (Sweden). Dept. of Ecology and Environmental Research); Elowson, S.; Christersson, L. Vattenfall AB, Vaellingby (Sweden). Mar 1993. 34 p.p. (In Swedish). Order Number DE93500939. Source: OSTI; NTIS.

The changes being made in Swedish agriculture today, from grain production to other forms of production, are the most comprehensive since the great land reform of the 18th century. So far, abandoned arable land has largely been planted with conifers. Timber quality in these types of plantations is poor, with shakes and rot. Most broadleaf trees worth growing, on the other hand, prefer to grow on good land such as the agricultural land now threatened with abandonment. They also have a positive influence on the soil through improving its level of fertility. Species within the poplar family that have attracted most interest are Populus alba, P. nigra, P. tremula, P. tremuloides, P. trichocarpa, P. balsamifera and P. deltoides, and to an even greater extent, hybrides between these species. The first three species are of Eurasian origin, whereas the four latter comes from North America. In earlier plantations with aspen and poplar the stem biomass production varied between 15 and 25 m^3 per hectare and year. A realistic assessment is that production can soon be increased by 20 %. (47 refs.).

The authors have investigated cutting and N management strategies for two biofuel feedstock candidate species – switchgrass (Panicum virgatum) and weeping lovegrass (Eragrostis curvula). Each was no-till planted in 1987 at three sites underlain by Davidson or Cecil soils. Three N levels (0, 50, or 100 kg/ha) were applied, and the plots fertilized at each level were harvested either twice (early-September and early-November) or only in early-November. The results with lovegrass suggest 50 kg N/ha is nearly optimal and that two cuttings provide more biomass than one. For switchgrass, when averaged across sites and years, 50 kg N/ha produced a slight yield advantage over no added N, but 50 kg was not different from 100 kg. In 1989 and 1990, more biomass was available in early-September harvests (9.6 Mg/ha) than in early-November (8.3 Mg/ha). Apparently the plants translocated significant portions of their biomass below ground during the last few weeks of the season. In 1991, we harvested only in early-November. Plots that had been cut in early-September in the previous three years had lower yields (7.6 Mg/ha) than those that had been cut only in early-November (9.4 Mg/ha). The delayed cutting permitted more growth on a sustained basis – presumably because of conservation of translocatable materials. This poses an interesting dilemma for the producer of biomass. In additional studies, the authors found no advantage in double-cropping rye (Secale cereale) with switchgrass; at low input levels, rye yields were low, and rye lowered switchgrass yields. Other studies showed double-cropping with winter-annual legumes such as crimson clover (Trifolium incarnatum) may have potential. The timing of herbicide treatment of the legume is critical.

25945 (SLU-SKOPRO-R–33) **Forest energy production from conventional forestry systems on a small scale.** Johansson, Tord (ed.). Swedish Univ. of Agricultural Sciences, Garpenberg (Sweden). Dept. of Forest Yield Research. 1992. 35p. (CONF-920003–: 1992 IEA workshop, Garpenberg (Sweden), 1992). Order Number DE93500891. Source: OSTI; NTIS.

Today, forest biomass used as fuelwood increase throughout the world. Different harvesting systems are available. Strong efforts on developing cheap and efficient machines are made. Mostly, fuelwood is harvested in thinning stands or at clear felled areas. In some cases, naturally regenerated forest on farmland managed as a source for biomass production is used for fuelwood. Fuelwood production is often managed by private owners with small areas and on a small scale. Different approaches to solve the harvesting and transporting problem in the view of small scale operation is presented. The effects of different kinds of biomass utilization on the economical and practical impacts are studied. The subject of this workshop, to show the possibilities of forest energy production on a small scale, is essential with the increasing interest by forest owners and the society. Five contributions from Canada, England, Sweden and Switzerland are separately indexed.

25946 (SLU-SKOPRO-R–33, pp. 3-5) **The farm wood fuel and energy project: A new Department of Trade and Industry initiative to stimulate the production and use of wood as a fuel.** Booth, T.C. (Renewable Energy Enquiries Bureau, ETSU, Harwell (United Kingdom)). Swedish Univ. of Agricultural Sciences, Garpenberg (Sweden). Dept. of Forest Yield Research. 1992. (CONF-920003–: 1992 IEA workshop, Garpenberg (Sweden), 1992). In *Forest energy production from conventional forestry systems on a small scale.* 35p. Order Number DE93500891. Source: OSTI; NTIS.

The british project for promoting short rotation cultivation is briefly described. Five farms will serve as demonstration and technique development centres and initiate the creation of a wood fuel market. Through involvement of other local farmers it is hoped that the centres will help to spread the silviculture in their area.

25947 (SLU-SKOPRO-R–33, pp. 7-15) **Fuelwood production in Prince Edward Island.** McCallum, B. (Ensight consulting, Prince Edward Island (Canada)). Swedish Univ. of Agricultural Sciences, Garpenberg (Sweden). Dept. of Forest Yield Research. 1992. (CONF-920003–: 1992 IEA workshop, Garpenberg (Sweden), 1992). In *Forest energy production from conventional forestry systems on a small scale*. 35p. Order Number DE93500891. Source: OSTI; NTIS.

The most recent Prince Edward Island Fuelwood Survey occurred in 1990-91. Consumption of fuelwood rose again to 49% of Prince Edward Island's 43,170 households. Total residential fuelwood consumption was estimated to be 242,000 m^3. The fuelwood industry makes an important contribution to the economy of Prince Edward Island. In the 1990-91 heating season, fuelwood valued at USD 9 million displaced approximately 43 million litres of domestic heating oil valued at USD 16.4 million. In addition, it is estimated that 70 cents of every dollar spent on fuelwood remains in the province and contributes spin-off benefits, whereas 90 cents of every dollar spent on heating oil is lost to the economy of Prince Edward Island. The percentage of people cutting their own fuelwood decreased from 52 in 1984-85 to only 23.4 in 1990-91. The governments of Canada and Prince Edward Island have implemented a series of Forest Resource Development Agreements (FRDAs) starting in 1983. The current 1988-1993 FRDA provides USD 24 million for research and incentives for reforestation and management of Prince Edward Island woodlots. It is expected that 3,800 Prince Edward Island woodlot owners will be participating in a woodlot management program by 1993. Silviculture treatments of hardwood stands include thinning, stand conversion (removal of lowgrade softwoods such as balsam fir in mainly hardwood stands), and shelterwood (strip) cutting, particularly in marginal stands. (9 refs.).

25948 (SLU-SKOPRO-R–33, pp. 17-21) **Forest energy production in Switzerland.** Steinmann, P.A. (ETH/SIA, Soral/Ge (Switzerland)). Swedish Univ. of Agricultural Sciences, Garpenberg (Sweden). Dept. of Forest Yield Research. 1992. (CONF-920003–: 1992 IEA workshop, Garpenberg (Sweden), 1992). In *Forest energy production from conventional forestry systems on a small scale*. 35p. Order Number DE93500891. Source: OSTI; NTIS.

Wood fuels are not produced on a large scale in Switzerland. Swiss authorities have recently started programs for making wood fuel production and use more efficient and increase the energy the energy wood consumption. New small scale technology is needed and trials have begun in this area.

25949 (SLU-SKOPRO-R–33, pp. 23-26) **Fuelwood production.** Liss, J.E. (Swedish Univ. of Agricultural Sciences, Garpenberg (Sweden). Dept. of Operational Efficiency); Swartstroem, J. The project has investigated the yield of naturally regenerated stands of broad-leaved trees. Biomass production of alder, birch and aspen may be large enough for commercial production. Cultivation of broad-leaves on farmland in this sense is foreseen to be used in a small-scale activity. Ten stands have been registered by height, diameters and dry weight of twigs and stems. The stands were 18-37 year old. Diameter at breast height was 60-120 mm. Dry weights, tonnes per hectare and year, was 4-6 for alder, 4-6 for Birch and 2-5 for aspen. Total costs per tonnes d.w. was 172-250 SEK for twigs and stems and 222-337 SEK for chips at roadside. Further research is needed for studies in the biological mechanism for sowing alder and birch on farm land with success. Also studies on the cultivation by aspen roots on farm land and the sucker production is necessary. Research on technical solutions of harvesting systems for small scale activity of fuelwood production is needed. (7 refs., 4 figs., 3 tabs.).

Source: OSTI; NTIS; GPO Dep.

This report describes Phase II of a project to design, construct, and demonstrate in the membrane separation system able to recover volatile organic compounds field a condensation/membrane separation system able to recover volatile organic compounds from effluent air streams. In the first phase of the program, a number of the high-pressure membrane modules to be installed in the system were constructed and evaluated, and the Field Demonstration Unit was designed. In the second phase, the Field Demonstration System was constructed and operated at MTR's laboratories with perchloroethylene, trichlorotrifluoroethane, and hexane, representative of chlorinated hydrocarbons, chlorofluorocarbons and fuel hydrocarbons, respectively. VOC removal from the feed stram was between 80% and 99.8%. Removal increased with increasing VOC content and with decreasing VOC volatility. A Module Field Evaluation Unit was also constructed for testing at the El Dorado plant of Great Lakes Chemical Corporation. The system, consisting of one membrane module housing containing one module insert, is installed on the pressurized vent from a condenser.

25952 (DOE/ER/13359–9) **[Mechanisms of potassium transport in plants and fungi]: Progress report.** Slayman, C.L. Yale Univ., New Haven, CT (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER13359. Order Number DE93016812. Source: OSTI; NTIS; GPO Dep.

Progress is reported on three front namely survey of ion channels in Arabidopsis; chemical characterization of the tonoplast cation channel (YVC1) in Saccharomyces; and characterization of a fungal proton pump cloned into mammalian cells. Continued work with the yeast plasma-membrane K^+ channel (YPK1) led to clear demonstrations that gating of YPK1 depends upon the disequilibrium voltage for K^+, rather than upon the absolute membrane voltage, and that all channels observable in the yeast plasmalemma are unchanged in primary pump mutants. Preliminary patch-clamp studies on the plasmalemma of Neurospora also identified two conspicuous cation channels in that membrane. A concerted effort to measure cytoplasmic pH in Saccharomyces and Neurospora by means of fluorescent pH indicators evinced two important findings that dyes taken up in (lipophilic) heavily esterified forms accumulate in vacuoles, not in the cytosol; and that the size and distribution of fungal vacuoles can be manipulated dramatically by altering carbon metabolism.

25953 (DTH-LET-RE–93-3) **Gasification of wood chips.** Henriksen, U.; Christensen, O.; Kofoed, E. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Lab. for Energiteknik. May 1993. 27p. (In Danish). Order Number DE93500184. Source: OSTI; NTIS.

Calculation models and results of experiments with the gasification of wood chips are presented. The aim was to evaluate the composition of the gas and the energy conditions in order to form a basis for the comparison of traditional concurrent, open core and two-step gasifiers. It was investigated how the two-step gasifier functioned with wood chips as fuel. It is concluded that in order to achieve high cold gas efficiency and specific heating values of the produced gas, preheating and/or externally heated pyrolysis is necessary. In the case of gasifiers without preheating facilities, the use

of dry wood will improve both cold gas efficiency and specific heating values. The two-step gasifier is well-suited for the gasification of wood chips even with varying moisture conditions. The capacity of the reactor is higher for wood chips than for straw. The composition of the gas is stable and no tar was observed in the gas. (AB).

25954 (ETSU-B–1314) **Assessment of d-RDF processing costs.** Aspinwall and Co. Ltd., Shrewsbury (United Kingdom). 1993. 117p. Order Number DE93506439. Source: OSTI; NTIS (US Sales Only); INIS.

The objectives of the project are:- to define on optimum process flowline for the production of a densified (a hard pellet) form of refuse derived fuel, d-RDF, which includes an aerobic composting module and a non-ferrous metal module; to produce capital and operating cost data; to develop a computer model for economic analysis of the systems; and to develop a computer model for the economic analysis the system with the addition of an Anaerobic Digestion module. (author)

25955 (ETSU-B/MS–00192/30/REP) **Preliminary review of the energy considerations in dewatering and drying sewage sludge to produce a fuel.** Halcrow Gilbert Associates Ltd., Swindon (United Kingdom). 1993. 40p. Order Number DE93504798. Source: OSTI; NTIS (US Sales Only).

This report sets into context the reasons why the energy content of sewage sludge may be exploited under UK circumstances. The characteristics of sewage sludges and their dewaterability are reviewed. Sewage sludge dewatering techniques and equipment in common use are described, with particular focus on filter plate/membrane presses, filter belt presses and centrifuges. The review includes a historical perspective, a process description and a brief resume of recent developments. The performance of various equipment in the field is also given. (author)

25956 (NEI-DK–1187) **Pre-and after-treatment of household wastes which have been sorted at the source for use in the production of biogas.** Jysk Biogas, Farsoe (Denmark). May 1993. 112p. (In Danish). Contract ENS-51161-91.0017. Order Number DE93500146. Source: OSTI; NTIS; INIS.

Up to half of the total amount of household wastes is made up of organic material which can be used in biomass conversion plants for the production of methane. By utilizing thermophillic conditions (about 55 degrees celcius) hygienic conditions are achieved, as bacteria cannot live under these conditions. The de-gassed wastes will still contain nitrates and minerals so they can be used as fertilizers. During anaerobic digestion methane is given off which can be used in gas engines as a fuel supplement to electricity and heat production. Household wastes can be gathered in plastic bags, and a certain amount of inorganic wastes (such as plastics) have unfortunately been found mixed in with the organic wastes. The experiments aimed at a solution to the sorting problem are described in relation to an actual biomass conversion plant where different types of household wastes and manures materials were used for anaerobic digestion. The treatment of the wastes before use in the plant is explained. A satisfactory and economical method of collection, sorting and use of household wastes was found. The stirring system separated the plastic from the organic wastes. 200 cubic meters of biogas was obtained from one cubic meter of waste materials, and the total amount of ammonia content was acceptable. A two-hour process of anaerobic digestion at 55/56 degrees centigrade resulted in hygienic conditions. Most of the weed seeds were killed in the process, this is important with regard to spreading weeds in the fields via the fertilizers. The energy balance was positive and there were minimal odour problems. (AB).

25957 (NEI-DK–1199) **Biogas production: (A) The effect of fish oil and bentonite (bleaching clay) on biogas production. (B) Removal of H_2S with the addition of $FeC1_2$ to the manure in biogas production.** Rockson, J.K. Nordvestjysk Folkecenter for Vedvarende Energi, Hurup (Denmark). Oct 1992. 55p. Order Number DE93500164. Source: OSTI; NTIS.

Hydrogen sulphide (H_2S) causes corrosion to metal components in biomass conversion plants. Many attempts have been to eradicate H_2S. The scrubbing method has proved to be expensive because of the need for very high pressure. The filtering method requires continuous or regular washing and changing or replacement of the filters. Adding ferrous chloride ($FeCL_2$) to the manure to eradicare the H_2S is found to be efficient, less labour intensive; time saving and economical. With regard to the increase in gas quantity by the addition of fish-oil-waste and benetonite (bleaching clay) to the manure, the result is every promising. The production of gas is thought to be increased by this means, which is the reason why the production of methane (CH_4) per. kg. volatile solid (VS) can be doubled. Most important, the whole transaction is economically viable. (AB).

25958 (NEI-DK–1204) **Pilot project concerning the establishment of a collective biomass conversion plant on the island of Mors.** Hedeselskabet, Viborg (Denmark). Miljoeteknisk Afd. Jun 1993. 101p. (In Danish). Contract ENS-51161-92.0075. Order Number DE93500212. Source: OSTI; NTIS; INIS.

This pilot project comprises a feasibility study in connection with plans to establish a biomass conversion plant, on the Danish island of Mors, which would provide methane to be used as fuel, in combination with natural gas, for a cogeneration plant serving six villages. The subjects of location, organization, the transportation of biomass, the design of the biomass conversion plant, economical aspects and conditions of the use of the methane are discussed as a basis for decisions in this respect. Environmental considerations are also dealt with. (AB).

25959 (NEI-DK–1206) **Thorsoe environmental and biogas plant Amba: Final report.** Bioplan Miljoekonsulenter ApS, Viborg (Denmark). Jan 1993. 127p. (In Danish). Contract ENS-51161-92.0035. Order Number DE93500201. Source: OSTI; NTIS.

A detailed description is given of a feasibility study concerning the establishment of a biomass conversion plant in Thorsoe, Denmark. A group of Danish farmers were the initiators. The aim was to promote the use of methane produced by the plant in combination with natural gas in relation to a cogeneration plant, and to discover how much such project would cost. The background for the initiative is given and the biogas concept, dealings with local authorities, tenders, budgets and financing are all described in addition to the design of the involved cogeneration plant. The text is illustrated with diagrams of the setup and relevant data. (AB).

25960 (NEI-DK–1209) **Technical and economical evaluation of methods for online determination of volatile fatty acids.** Krueger, I. WasteSystems A/S, Soeborg (Denmark). May 1993. 12p. (In Danish). Contract ENS-1383/91-0001. Order Number DE93500393. Source: OSTI; NTIS.

EFP-91.

This technical and economical evaluation of methods for the online determination of volatile fatty acids (VFA) relates to biomass conversion plants. Methods involving titration, gas chromatography and mass spectrometry are dealt with. It is stated that only titration of the total content of volatile fatty acids has reached a stage where it could be commercially interesting. A whole system for VFA analysis and control and regulation would currently cost 400.000 - 500.000 Danish kroner. In order for this to be economically feasible it would be necessary for the biomass conversion plant to produce 2-5% more methane. The three methods are briefly explained, and their accuracy and stage of development are discussed. Economical aspects are more extensively dealt with. (AB).

The catalytic conversion of methane from natural gas into a readily transportable liquid fuel is a research area that is currently attracting considerable attention. This is a difficult transformation from a thermodynamic viewpoint since methane is a relatively unreactive substance and chemicals derived from methane are substantially more reactive than methane itself. Thus, no industrial

process to date has been able to convert methane to liquid products in high yield. One of the more studied process is the oxidative coupling of methane to higher hydrocarbons and olefins. We undertook a program to take advantage of the selectivity already known to exist in a bacterial enzyme system. A group of aerobic soil/water bacteria called methanotrophs can efficiently and selectively utilize methane as the sole source of energy and carbon for cellular growth. The first reaction in this metabolic pathway is the conversion of methane to methanol and is catalyzed by the enzyme methane monooxygenase (MMO). Our work centers on the characterization of the structure/activity relationships of the particulate form of MMO and synthesis and characterization of inorganic/organic chemical models of MMO (both particulate and soluble).

25962 (SNV–4161) **Incineration of sorted industrial wastes: Basic report: Waste characterization.** Viberg, T. (Miljoekonsulterna i Studsvik AB, Nykoeping (Sweden)); Oehrstroem, T. Swedish Environmental Protection Agency, Solna (Sweden); Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden); Svenska Renhaallningsverksfoereningen, Malmoe (Sweden); Miljoekonsulterna i Studsvik AB, Nykoeping (Sweden). Sep 1992. 34p. (In Swedish). (NUTEK-AVF–93-1;RVF–92-17-1;MKS–92-74). Order Number DE93500872. Source: OSTI; NTIS.

Characterization and preparation of industrial wastes from several different swedish sources for use in incineration plants are described. Comparative combustion tests were performed at the Borlaenge incineration plant. Each waste-type was analyzed according to its content of wood, paper, laminates, plastics, rubbers, textiles, metals, and other combustible/non-combustible materials. (16 figs., 10 tabs.).

The prevailing image of wood and waste burning as dirty and environmentally harmful is no longer valid. The use of biomass combustion for energy can solve many of our nation's problems. Wood and other biomass residues that are now causing expensive disposal problems can be burned as cleanly and efficiently as natural gas, and at a fraction of the cost. New breakthroughs in integrated waste-to-energy systems, from fuel handling, combustion technology and control systems to heat transfer and power generation, have dramatically improved system costs, efficiencies, cleanliness of emissions, maintenance-free operation, and end-use applications. Increasing costs for fossil fuels and for waste disposal strict envirorunental regulations and changing political priorities have changed the economics and rules of the energy game. This report will describe the new rules, new playing field and key players, in the hopes that those who make our nation's energy policy and those who play in the energy field wig take biomass seriously and promote its use.

25964 (ETDE-IT–93-166) **Biomass combustion: Italian ENEA experimental plant.** Chiado Rana, M. ENEA, Saluggia (Italy). Area Nucleare. 1992. 19p. (In Italian). This paper outlines the key design features of an experimental biomass combustion plant built at the ENEA (the Italian Agency for New Technology, Energy and the Environment) Saluggia research center. Based on the results of performance tests using rice husks as fuel, indications are given as to the energy efficiency, economic feasibility and environmental compatibility of the innovative biomass combustion process.

25965 (ETSU-B–1278) **Development of a chain grate stoker for d-RDF combustion.** Senior Thermal Engineering Ltd., Wakefield (United Kingdom). 1993. 118p. Order Number DE93506438. Source: OSTI; NTIS (US Sales Only).

This project is part of the Department of Trade Industry's programme to establish the technical viability of d-RDF as a fuel. d-RDF combustion trials on shell boilers forms an integral part of this programme. The objectives of the project are: to develop the combustion system for 100% d-RDF firing to the point where the system can be applied commercially with confidence; to present the range of measures required to retrofit existing equipment for d-RDF firing, with an analysis of costs and expected savings, areas of technical uncertainty and likely environmental impact; to assess the relative merits of d-RDF firing alone or as a admixture with coal; and to suggest modifications that should be made to the system if purchased as a new installation, with an estimate of the marginal costs involved. (author)

25966 (NUTEK-VK–93-9) **Analysis of wood powder combustion in a diesel engine.** Olsson, Erik (Chalmers Univ. of Technology, Gothenburg (Sweden). Dept. of Thermo and Fluid Dynamics). Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). 1993. 39 p.p. (In Swedish). Project NUTEK-566-032. Order Number DE93500755. Source: OSTI; NTIS.

The aim of this project is to investigate the economics of a wood powder fueled diesel engine. Questions also discussed are the reduction in efficiency compared to oil as a fuel, and the expected effects on service life and maintenance cost. The analysis shows that the concept is economically defendable compared to other biomass fueled power plants. It seems also to be technically feasible. (9 refs., 4 figs.).

25967 (SNV–4160) **Incineration of sorted industrial wastes: Main report.** Swedish Environmental Protection Agency, Solna (Sweden); Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden); Svenska Renhaallningsverksfoereningen, Malmoe (Sweden). Nov 1992. 39 p.p. (In Swedish). (NUTEK-AVF–93-1;RVF–92-17). Order Number DE93500869. Source: OSTI; NTIS.

The aim of the project has been to evaluate suitable combustion technologies and environmental consequences of waste incineration, and to suggest classification criteria of sorted industrial wastes. Industrial wastes have been sampled at six swedish sites with already established programs, and transported to one of these sites for incineration tests. For each of the six different waste categories the following properties were determined: Calorific content, Carbon dioxide emission, Ash composition, Flue gas emissions, and Incinerator design. (12 figs., 14 tabs.).

25968 (SNV–4162) **Incineration of sorted industrial wastes: Basic report: Incineration tests.** Bergstroem, J. (Miljoekonsulterna i Studsvik AB, Nykoeping (Sweden)); Oehrstroem, T. 25971 (NUTEK-R–92-31) **Waste -92: Fuel from household and industry waste.** Ekwall, K. (Svenska Renhaallningsverksfoereningen, Stockholm (Sweden)). Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). Nov 1992. 39p. (In Swedish). Order Number DE93500661. Source: OSTI; NTIS; INIS.

The report gives a review of waste incineration in Sweden today, including environmental and legal aspects. 21 incinerator plants are in use, producing heat to district heating network and, to a minor part, electric power. In 1991 1.31 Mton household waste and 0.35 Mton industrial waste were incinerated producing 4.4 Twh of energy. In a few cities 30-40 percent of the district heat comes from waste incineration. The theoretical and practical potentials for energy production in Sweden are estimated to 7 respective 5 TWh for household waste and 9 respective 5-6 TWh for industrial waste. Landfill gas is extracted at about 35 sites, with a yearly production of 0.3 TWh which corresponds to 3-5 percent of the potentially recoverable quantity. (8 refs., 2 figs., 13 tabs.).

25972 (VF-UB–92-46) **Long-distance transport of bioenergy fuel to VEGA.** Brunberg, B. Vattenfall AB, Vaellingby (Sweden). Dec 1992. 75 p.p. (In Swedish). Order Number DE93500933. Source: OSTI; NTIS.

A planned erection of VEGA, a pressurized gasifier with combined cycle, at Eskilstuna in Sweden, would increase the risk of insufficient bioenergy fuel being available within the traditional procurement area, i.e. within a mean transport distance of 70-80 km. However, there is likelihood that VEGA's fuel requirements cannot be met, given that fuel can be brought in from further afield by rail or water. It is estimated that large volumes of both logging residue and sawmill residues would be available in the Bergslagen and southern Norrland regions of the country. Taking the fuel by sea from the mills on the coast to a suitable dock on Lake Maelaren would entail the additional cost of transporting it by road from the dock to the VEGA plant, as a result of which road haulage for the entire stretch would be more economical over distances of up to 170-180 km. Yet, compared with road haulage, sea transport would offer more scope for negotiating lower fuel prices. Rail transport appears to be a realistic option. The proposed VEGA site is very close not only to the railway but also to several sawmills in the region concerned. In addition, rail transport is currently being developed and analysis of the costs has shown it to be competitive. Depending on the fuel assortment to be carried, rail transport can compete with road haulage over distances of 80-130 km. (8 refs., 26 figs.).

25973 (ETSU-B–1313-P2) **An emissions audit from a chain-grate stoker burning d-RDF.** Jackson, P.M.; King, P.G. Warren Spring Lab., Stevenage (United Kingdom). 1993. 107p. Contract E/5A/1313/2450;Project WSL 3311X. (WSL-CR–3523(MR)). Order Number DE93504810. Source: OSTI; NTIS (US Sales Only); INIS.

This report describes the Emissions Audit carried out on a chain-grate stoker shell boiler burning dRDF at the Senior Foster Wheeler test facility in Wakefield to provide design data for gas cleaning equipment. Sampling was therefore performed in the absence of any abatement equipment other than a standard cyclonic grit arrestor. The chain-grate stoker boiler was tested at two steam loads: 40% MCR to represent low load and, 80% MCR to represent high steam load. Acid gas concentrations in the flue gas were unacceptable. The dominant gas being HCl at 850-1000mgm^{-3} for both tests, was considerably higher than the guideline for new plant of 50mgm^{-3}. HF was also measured at concentrations in excess of the guidance value. It will be necessary to install acid gas scrubbing equipment before dRDF will be acceptable as a fuel. SO_2 and NO_x were both present in measurable concentrations but under current guidance were no cause for concern. (author)

25974 (ETSU-B–1313-P4) **An emissions audit of a biomass combustor burning treated wood waste.** Jackson, P.M.; Jones, H.H.; King, P.G. Warren Spring Lab., Stevenage (United Kingdom). 1993. 101p. (WSL-CR–3560(MR)). Order Number DE93505272. Source: OSTI; NTIS (US Sales Only); INIS.

This report describes the Emissions Audit carried out on a Biomass Combustor burning treated wood waste at the premises of a furniture manufacturer. The Biomass Combustor was tested in two firing modes; continuous fire and modulating fire. Combustion chamber temperatures and gas residence times were not measured. Boiler efficiencies were very good at greater than 75% in both tests. However, analysis of the flue gases indicated that improved efficiencies are possible. The average concentrations of CO (512mgm^{-3}) and THC (34mgm^{-3}) for Test 1 were high, indicating that combustion was poor. The combustor clearly does not meet the requirements of the Guidance Note for the Combustion of Wood Waste. CO_2 and O_2 concentrations were quite variable showing that combustion conditions were fairly unstable. Improved control of combustion should lead to acceptable emission concentrations. (Author)

25975 (ETSU-B–1313-P5) **An emissions audit of a purpose built whole bale straw combustor.** Jackson, P.M.; Jones, H.H.; King, P.G. Warren Spring Lab., Stevenage (United Kingdom). 1993. 89p. (WSL-CR–3592(MR)). Order Number DE93504519. Source: OSTI; NTIS (US Sales Only); INIS.

This report describes an Emissions Audit carried out on a purpose built whole bale straw combustor developed by Henley Burrowes and Co. Ltd in association with ETSU. To gain a true assessment of the emissions from the unit, tests were conducted with the abatement equipment not operating. The whole bale straw combustor was tested at one operating condition, the two tests performed indicated good reproducibility of operation. Gas phase temperatures of 1100°C and 960°C were measured in the primary and secondary combustion chambers respectively. Gas residence times in these chambers were not measured. The boiler efficiency was measured by two methods, both giving a value of 67%. This efficiency was quite low, but due to site restrictions the boiler had been down graded to produce hot water instead of steam. (Author)

25976 (ETSU-B/MS–00192/05/REP) **Economic assessment of emissions abatement for small-scale waste combustion.** ECOTEC Research and Consulting Ltd., Birmingham (United Kingdom). 1993. 116p. Order Number DE93505270. Source: OSTI; NTIS (US Sales Only); INIS.

This report presents a preliminary economic assessment of various pollution abatement systems which could be applied to waste combustion projects. For the purpose of this work a rigorous analysis of the technical performance has not been carried out. Costs for plants have been obtained from UK manufacturers against specifications from three plants at different scales. The manufacturers were free to submit any design they felt was capable of achieving the required performance and a wide range of designs were received. The economic analysis was designed to examine

comparative capital costs and attempt to assess the overall annualised costs by calculation of the running costs for each system. The study shows that simple comparisons on capital cost are insufficient to determine the most cost effective method of pollution abatement. In addition several areas of uncertainty exist in both technical performance and costs of these systems. (Author)

25977 (VF-UB–93-10) **Forest fuel reduces the nitrogen load.** Lundborg, A. Vattenfall AB, Vaellingby (Sweden). Mar 1993. 93 p.p. (In Swedish). Order Number DE93500942. Source: OSTI; NTIS; INIS.

A study of the literature was made on the basis of the following hypothesis: "If nitrogen-rich felling residues are removed from the forest, the nitrogen load on the forest ecosystem is decreased and the risk of nitrogen saturation also decreases". The study was designed to provide information on how the nitrogen situation is influenced if felling residues are removed from nitrogen-loaded forests and used as fuel. Felling residues release very little nitrogen during the first years after felling. They can immobilize nitrogen from the surroundings, make up a considerable addition to the nitrogen store in the soil, but also release nitrogen in later stages of degradation. The slash has an influence on the soil climate and thus on soil processes. Often there is an increase in the mineralization of litter and humus below the felling residues. At the same time, nitrification is favoured, particularly if the slash is left in heaps. Felling residues contain easily soluble nutrients that stimulate the metabolization of organic matter that otherwise is rather resistant to degradation. The slash also inhibits the clear-cut vegetation and its uptake of nitrogen. These effects result in increased leaching of nitrogen and minerals if the felling residues are left on the site. (99 refs.).

0960 Health and Safety

25978 (IVL-B–1088) **The work environment at thermal power plants using biofuel and peat. Presence and concentrations of airborne micro-organisms, endotoxins and dust and proposals to control measures.** Davila, E. Alvarez de; Bengtsson, L. Swedish Environmental Research Inst., Stockholm (Sweden). Jan 1993. 42p. (In Swedish). Order Number DE93500708. Source: OSTI; NTIS.

In the present study the concentration of airborne micro-organisms (fungi, bacteria), endotoxins and dust have been measured at three thermal power plants. Two of the plants used wood fuel and one used peat. The measurements were carried out as stationary measurements at different positions along the handling of biofuel at delivery, transportation and storage. Personal samples were taken in the reception hall when fuel from trucks were tipped and when the plant was rounded. The levels of bacteria, fungi, endotoxins and dust varied between different positions in the plants and between the three plants. The concentration varied according to type of fuel, fuel quality, the construction of the plants and the way in which the fuel was handled. The stationary samples showed higher concentrations of bacteria and fungi at the plant using peat. Enhanced concentrations were measured when old stored peat was used. The concentration of endotoxins was low in all three plants. The highest concentration of endotoxins was found during unloading of old stored wood fuel. Respiratory symptoms have been observed among the personnel at the plant using peat. A review has been made of the literature about health hazards after exposure to micro-organisms, endotoxins and dust from biofuel (wood and peat). Recommendations for improvement of the work environment are included in the report. (25 refs., 11 figs., 4 apps.).

25979 (ETSU-B–1374) **Production and combustion of c-RDF for on-site power generation.** Gulley, B.; Burnett, S. Aspinwall and Co., Shrewsbury (United Kingdom). 1992. 47p. Order Number DE93504795. Source: OSTI; NTIS (US Sales Only).

This report describes work commissioned by ETSU (on behalf of the Department of Trade and Industry) to assess the production and combustion of coarse refuse derived fuel (c-RDF), and its use as a fuel for power generation on-site at a single plant location. The technical feasibility of c-RDF production, and on-site combustion and power generation has been established, and the financial attractiveness of investment in c-RDF plant has been explored using an economic model and DCF techniques. The results show that c-RDF is a potentially attractive waste management option in areas where waste tonnages of around 200,000 tonnes per annum are available. On the basis of this study the costs and economics of c-RDF production, and combustion and power generation have been shown to be similar to those for mass-burn incineration or bulk transfer to a distant landfill. (author)

25980 (ENEA-RT-AMB–91-07) **Agro-industrial anaerobic digestion cost benefits: Technology utilization in distillery.** De Poli, F.; Mela, E.; Pasqualini, S. ENEA, Casaccia (Italy). Area Energia Ambiente e Salute. Feb 1991. 78p. (In Italian). (RT/AMB–91-07). Order Number DE93799213. Source: OSTI; NTIS (US Sales Only).

Anaerobic digestion, followed by aerobic post treatment, is widely used as a treatment technology of distillery wastes. An economic comparison between two different treatment processes; a traditional concentration unit and the termophilic hybrid anaerobic digester, was done. The costs/benefits balance shows the strong advantage of the anaerobic process, even if the value of by-products from the concentrator is higher than the ones from the digester; the operation costs (mainly labour and energy) of the concentrator are strongly higher, and the balance becomes negative. The NPV of the two plants shows always negative values for the concentrator, while the digester can become convenient under some conditions.

Methane monooxygenase (MMO) is an enzyme found in methanotrophs that catalyses the selective oxidation of methane to methanol. MMO is protein complex one component of which is a binuclear metal center containing oxygenase. We have completed one round of a design/synthesis/evaluation cycle in the development of coordination complexes that mimic the structure/function of the MMO active site. One of these, a binuclear, coordinately-asymmetric copper complex, is capable of oxidizing cyclohexane to a mixture of cyclohexanol and cyclohexanone in the presence of hydrogen peroxide.

This report summarizes fish culture and research activities conducted from December 1991 to October 1992 by the National Marine Fisheries Service (NMFS) on the Redfish Lake (Idaho) sockeye salmon captive broodstock study. Bonneville Power Administration (BPA) has funded restoration efforts for Redfish Lake sockeye salmon. Snake River sockeye salmon, now represented only by the Redfish Lake population, were formally listed as endangered under the Endangered Species Act (ESA) by the NMFS in December 1991. Restoration is being coordinated through the Stanley Basin Sockeye Technical Oversight Committee. Participation by state and federal agencies and private groups involved in sockeye salmon restoration efforts in Idaho. Our efforts since then have focused on rearing of 1991-brood Redfish Lake sockeye salmon at the NMFS/BPA Stock Restoration Laboratory at the NWFSC (Seattle, Washington), and on research to refine captive-broodstock methodology.

Div. of Fish and Wildlife. May 1993. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-91BP60629. Order Number DE93016808. Source: OSTI; NTIS; GPO Dep.

Operational plans for Clearwater, Magic Valley, McCall, Niagara Springs Steelhead, Oxbow, Pahsimeril, Rapid River, and Sawtooth Hatcheries are individually described.

25988 (DOE/BP/92818–1) **Migratory characteristics of spring chinook salmon in the Willamette River: Annual report, 1991.** Snelling, J.C.; Schreck, C.B.; Bradford, C.S.; Davis, L.E.; Slater, C.H.; Beck, M.T.; Ewing, S.K. Oregon State Univ., Corvallis, OR (United States). Dept. of Fisheries and Wildlife. May 1993. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-88BP92818. Order Number DE93016802. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents our research to examine in detail the migration of juvenile and adult spring chinook salmon in the Willamette River. We seek to determine characteristics of seaward migration of spring chinook smolts in relation to oxygen supplementation practices at Willamette Hatchery, and to identify potential sources of adult spring chinook mortality in the Willamette River above Willamette Falls and use this information towards analysis of the study on efficiency of oxygen supplementation. The majority of juvenile spring chinook salmon released from Willamette hatchery in 1991 begin downstream movement immediately upon liberation. They travel at a rate of 1.25 to 3.5 miles per hour during the first 48 hours post-release. Considerably slower than the water velocities available to them. Juveniles feed actively during migration, primarily on aquatic insects. Na^+/K^+ gill ATPase and cortisol are significantly reduced in juveniles reared in the third pass of the Michigan series with triple density and oxygen supplementation, suggesting that these fish were not as well developed as those reared under other treatments. Returning adult spring chinook salmon migrate upstream at an average rate of about 10 to 20 miles per day, but there is considerable between fish variation. Returning adults exhibit a high incidence of wandering in and out of the Willamette River system above and below Willamette Falls.

25989 (DOE/BP/94402–7) **Columbia River coordinated information system report on information needs.** Weber, E. (Columbia River Inter-Tribal Fish Commission, Portland, OR (United States)); Roseberry, A.C.; Petrosky, C.; Allen, S.; Kinney, W.J.; Rowe, M. Columbia River Inter-Tribal Fish Commission, Portland, OR (United States); Idaho Dept. of Fish and Game, Boise, ID (United States); Washington Dept. of Fisheries, Olympia, WA (United States); Shoshone-Bannock Tribe, Fort Hall, ID (United States). May 1993. 162p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG79-89BP94402. Order Number DE93016701. Source: OSTI; NTIS; GPO Dep.

Successful application of adaptive management to rebuilding the Columbia Basin's anadromous fish resources requires that available information and experience be organized and shared between numerous organizations and individuals. Much of this knowledge exists only in unpublished form in agency and individual files. Even that information which is published in the form of technical and contract reports receives only limited distribution and is often out of print and unavailable after a few years. Only a small fraction of the basin's collective knowledge is captured in permanent and readily available databases and recognized journals. State, tribal, and federal fishery managers have recognize these information management problems and have committed to a program, the Coordinated Information System Project, to capture and share more easily the core data and other information upon which management decisions are based. That project is now completing the process of scoping and identification of information needs. Construction of prototype systems will begin in 1992. This report is one

in a series of seven describing the results of the Coordinated Information on System scoping and needs identification phase.

25990 (DOE/BP/98852–1) **Above Bonneville passage and propagation cost effectiveness analysis: Technical report, January 1993.** Paulsen, C.M.; Hyman, J.B.; Wernstedt, K. Resources for the Future, Inc., Washington, DC (United States). May 1993. 214p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC79-89BP98852. Order Number DE93016702. Source: OSTI; NTIS; INIS; GPO Dep.

We have developed several models to evaluate the cost-effectiveness of alternative strategies to mitigate hydrosystem impacts on salmon and steelhead, and applied these models to areas of the Columbia River Basin. Our latest application evaluates the cost-effectiveness of proposed strategies that target mainstem survival (e.g., predator control, increases in water velocity) and subbasin propagation (e.g., habitat improvements, screening, hatchery production increases) for chinook salmon and steelhead stocks, in the portion of the Columbia Basin bounded by Bonneville, Chief Joseph, Dworshak, and Hells Canyon darns. At its core the analysis primarily considers financial cost and biological effectiveness, but we have included other attributes which may be of concern to the region.

25991 (VF-H–92-1) **Environmentally adjusted oil and grease.** Andersson, Bert; Lindberg, J. (eds.). Vattenfall AB, Vaellingby (Sweden). 1992. 65p. (In Swedish). Order Number DE93500672. Source: OSTI; NTIS; INIS.

With the intention of maintaining healthy environment in our rivers Vattenfall in 1988 initiated a project called 'Environmentally friendly oils'. The goal was to find oils for bearings and hydraulic systems that would cause less negative environmental effects and still maintain a good technical function. Based on the results of the project it is recommended, for both economical and environmental reasons, to change to synthetic oil in bearings and to hydraulic oil made of white oil in regulating systems. The change may be carried out in connection to other work on the system in question. Special care is recommended when cleaning the system from old oil and dirt. In order to maintain the high quality of the oil, also during manufacturing and assembling, one should follow the recommendations outlined in the report. In bearings where used grease leaks into the river, a grease made of white oil should be used. The quality of the rubber sealings must be adapted to the oil used, in order to secure a good function. In order to bring down the number of products and to create an open market some additional changes is necessary in the specifications of oil. Further research regarding oil and sealing is planned. (3 refs.).

25992 (VF-H–92-5) **Fish barriers: Methods to divert fish (avoidance, attraction) at hydroelectric power installations.** Larsson, Mats (Vattenfall HydroPower AB, Vaellingby (Sweden)). Vattenfall AB, Vaellingby (Sweden). Nov 1992. 94p. (In Swedish). Order Number DE93500675. Source: OSTI; NTIS; INIS.

In addition to literature reviews laboratory experiments with both strobe light and different kinds of sound stimuli were carried out. In the experiments silver eel, brown trout, arctic char and salmon smolts were tested. The experiments showed that in darkness silver eel avoided strobe light with intensities between 0.4 and 8.7 lux with 80-90% avoidance in 8.7 lux. The avoidance reactions decreased when background light was raised to 9 lux. Brown trout did not show as strong avoidance reactions possibly due to aggressive behaviour between different individuals of brown trout. The avoidance reaction was however more pronounced in dim background lift with an intensity of 5 lux than in darkness. The experiments also showed that the avoidance reactions started within a few seconds after exposure to strobe light. The frequencies 6.0 and 15 Hz were more effective as triggers of avoidance reactions than were the frequencies 2.1 and 160 Hz. Arctic char did not show any avoidance reactions to strobe light. It was actually attracted to strobe light with the frequency 160 Hz in total darkness and indifferent in dim background light 10 lux. Experiments in running water also showed that salmon smolts could be diverted from an area exposed to strobe light with the frequency 15.0 Hz. The effect was more pronounced in darkness than in dim background light and also more pronounced when water current was 20 cm/s than when it was 40 or 60 cm/s. Experiments to test the avoidance reactions to sound was also performed. The evaluation of these results where however complicated by the fact that the fishes swam rapidly to and fro in the experimental chamber and thus by pure chance very frequently were close to the sound generator.

1308 Health and Safety

25993 (VF-H–92-6) **Ageing in embankment dams: Pilot study.** Nilsson, Aake (VBB VIAK, Stockholm (Sweden)); Norstedt, U. Vattenfall AB, Vaellingby (Sweden). Dec 1992. 45 p.p. (In Swedish). Order Number DE93500678. Source: OSTI; NTIS.

In this pilot study the ongoing work in the ICOLD Subcommittee on ageing of earth and rockfill dams is described. The following ageing scenarios are presented in detail: *Ageing of foundation materials resulting in internal erosion. *Ageing of embankment materials resulting in internal erosion. * Ageing of embankment materials resulting in surface erosion. *Ageing resulting in loss of bond between concrete structures and the embankment. From the statistics of a number of cases reported by ICOLD committee on deterioration of dams and reservoirs it is concluded that deterioration resulting in surface erosion is the most common deterioration after percolation in the foundation and dam body. However, it should be noted that among the cases with surface erosion no failure has been reported. Attention should also be drawn to the frequency of failures related to bonding between structures and adjoining embankments. It may be pointed out that bonding between structures and adjoining structures and internal erosion in the dam body are the types of deterioration with the highest probability of causing failures. Finally, the research needs in ageing of embankment dams are described. It is proposed that ageing phenomena, which are difficult to detect, should be studied further in order to reach a better understanding as well as study appropriate methods for their detection. Also earlier observed ageing cases in Swedish embankment dams should be studied and reported, and methods of detecting ageing should be studied and tested. (15 refs., 10 tabs., 4 figs.).

14 SOLAR ENERGY

1401 Resources and Availability

25994 (NREL/TP–411-5013) **Photovoltaic Advanced Research and Development project: Solar radiation research annual report, 1 October 1990–30 September 1991.** Hulstrom, R.; Cannon, T.; Stoffel, T.; Riordan, C. National Renewable Energy Lab., Golden, CO (United States). Oct 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE92016430. Source: OSTI; NTIS; GPO Dep.

This report is a summary of the year 1991 research activities and results under the Solar Radiation Research task of the Photovoltaic (PV) Advanced Research and Development project at the National Renewable Energy Laboratory (NREL). This task directly supports the characterization, testing, and design of PV cells modules, and systems. The development of a scientific and engineering understanding of incident (i.e., available to PV devices) solar irradiance and the appropriate instrumentation systems and measurement methods are the activities and results of this project. Activities described in this report include the completion of the Atmospheric Optical Calibration Systems (AOCS) and the comparison of instrumentation systems that collect site-specific measurements of solar irradiance for the purpose of PV system feasibility studies and/or design.

25995 (ANL/CHM/CP–79459) **Ultrafast photoinduced electron transfer reactions in supramolecular arrays: Studies of electronic coupling and solvation.** Wasielewski, M.R.; Wiederrecht, G.P.; Svec, W.A. Argonne National Lab., IL (United States).

[1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9306113–1: 17. solar photochemistry research conference, Brainerd, MN (United States), 6-10 Jun 1993). Order Number DE93012910. Source: OSTI; NTIS; GPO Dep.

Research in our laboratory focuses on developing supramolecular arrays that produce long-lived charge separation by limiting the electronic coupling between the separated charges, and on the role of solvation in determining the rates and energetics of photoinitiated electron transfer reactions. Arrays have been developed that closely mimic the electronic coupling that was observed only for long-lived radical pairs produced in photosynthetic glassy solids. A series of 36 fixed-distance donor-acceptor molecules using porphyrin donors, triptycene spacers, and 9 different acceptors has been prepared; these are used to probe the dependence of photoinduced charge separation rates on free energy of reaction as a function of solvent both in liquid and solid solution. Data were obtained on rates of charge separation in dioxane, MTHF, butyronitrile, toluene, chlorobenzene, and benzonitrile.

25996 (DOE/CE/15974–T4) **[Study of novel conductive paints for solar cell electromagnetic fields]: Progress report, February 24, 1993–May 1, 1993.** Soukup, R.J.; Ianno, N.J. Nebraska Univ., Lincoln, NE (United States). Dept. of Electrical Engineering. [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-92CE15974. Order Number DE93015088. Source: OSTI; NTIS; GPO Dep.

Progress in adhesion and electric resistivity studies on paints for use as solar cell contacts is reviewed. Some results on resistivity vs. baking temperature for some paints are shown.

25997 (DOE/ER/20076–1) **Photosynthetic electron transport in genetically altered chloroplasts: Progress report, June 15, 1992–June 15, 1993.** Sayre, R.T. Ohio State Univ., Columbus, OH (United States). Jun 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER20076. Order Number DE93017200. Source: OSTI; NTIS; GPO Dep.

We have generated and characterized the phenotypes of several photosystem II,D1 protein mutants in Chlamydomonas reinhardtii chloroplasts. The first set of mutants which we produced were at residue H195 on the D1 protein, adjacent to histidine -198 (H198), a putative ligand to the redox active chlorophyll special pair, P680. Conservative amino acid replacements at H195 had little effect on electron transfer whereas non-conservative replacements had significant effects on electron transfer processes, particularly rates of transfer from Z to P680. In contrast, histidine 190 (H190) mutants were unable to evolve oxygen, had reduced manganese content, slower rates of charge transfer from Z to P680 and lacked the A_t thermoluminescence band. These results suggested that H190 may be a redox active histidine residue required for photoligation of manganese into the water oxidizing complex. EPR studies demonstrated that H190 does not H-bond to Z. This is in contrast to the H190 residue of the D2 protein which does H-bond to the redox active tyrosine, D. These are the first results which identify a specific histidine residue as potentially being redox active in photosystem II and have implications for the structure of the water oxidizing complex.

25998 (ETDE-IT–93-193) **Structural and electrical properties of highly conductive microcrystalline Si(P) layers.** Conte, G.; Addonizio, M.L.; Nobile, G.; Rubino, A.; Terzini, E. ENEA, Portici (Italy). Centro Ricerche Fotovoltaiche. 1992. 12p. (CONF-9210371–1: 12. international vacuum congress, The Hague (Netherlands), 12-16 Oct 1992). Order Number DE93799214. Source: OSTI; NTIS (US Sales Only).

Thin films of phosphorus doped microcrystalline Si were prepared in a glow discharge reactor starting from hydrogen diluted silane using less than 5 watts of RF power. Conductivities as high as 41 S/cm were measured on samples deposited at 210 degrees C. The discharge parameters and reactor geometry were examined in order to correlate the real dissipated RF power with the structural and electrical properties of the material. XRD, SEM, Raman spectroscopy and electrical characterization techniques were used. All the samples showed clusters that increased with film thickness, while at the same time the crystallite size changed in the range of 30-75 A.

25999 (LUNKDL-NKBK–1038-1-94-93) **Heterogeneity in Photosystem I: The domain organization of the chloroplast thylakoid membrane.** Andreasson, E. Lund Univ. (Sweden). Dept. of Biochemistry. Jan 1993. 47p. Order Number DE93500862. Source: OSTI; NTIS.

This thesis has focused on localizing the three large protein complexes responsible for the photosynthetic electron flow in the plant thylakoid membrane, i.e. Photosystem I (PSI), Photosystem II (PSII) and the cytochrome b/f complex. The intention was to localize the components in the grana and in the stroma lamellae region of the thylakoid membrane respectively. Also possible differences among protein complexes present in both regions were to be investigated. For these purposes a quantitative and reproducible disintegration and separation method was developed. Even though PSI was shown to be enriched in the stroma lamellae region of the thylakoid membrane while PSII was shown to be enriched in the grana region, the components were present in both membrane regions. It was found that not only PSII but also PSI is heterogeneous in antenna size. Light saturation curve analysis of the PSI activity and P700 photooxidation kinetics demonstrated that PSI in the grana stacks retain a 30-40% larger functional antenna size than PSI in the stroma lamellae. It was found that the cytochrome b/f complex is rather uniformly distributed between the two membrane regions with a slight enrichment in the grana region. A model of the thylakoid membrane is proposed in which the grana stacks and the stroma lamellae are more or less independent compartments within the thylakoid. The photosystems of the grana, $PSI\alpha$ and $PSII\alpha$ located in the granal periphery and the granal core respectively, are proposed to work in linear electron flow, while $PSI\beta$ in the stroma lamellae is involved in cyclic electron transport. (117 refs., 14 figs., 3 tabs.).

26000 (SAND–92-2870C) **Proposed guidelines for reporting performance of a solar dish/Stirling electric generation system.** Stine, W.B. (California State Polytechnic Univ., Pomona, CA (US). Dept. of Mechanical Engineering); Powell, M.A. Sandia National Labs., Albuquerque, NM (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930804–9: 28. intersociety energy conversion engineering conference, Atlanta, GA (United States), 8-13 Aug 1993). Order Number DE93016493. Source: OSTI; NTIS; GPO Dep.

Experimental performance data from dish/Stirling system testing can be analyzed to generate a system performance model. An approach to developing an experimentally based performance model of a dish/Stirling system is given. Two methods for analyzing the experimental data are described. To provide information that will permit comparison of dish/Stirling systems, it is necessary to define many of the details involved in calculating system performance data such as the net system output and system solar-to-electric efficiency. This paper describes a set of guidelines for these calculations, based on past experience, especially with the Vanguard dish/Stirling system. Also presented are a set of rating conditions at which a maximum value for system efficiency can be calculated. Comparison between systems of their rated peak solar-to-electric efficiency is made possible when these rating conditions are in common use by manufacturers and testing agencies.

26001 (SAND–92-2872C) **Emitter Wrap-Through solar cell.** Gee, J.M.; Schubert, W.K.; Basore, P.A. Sandia National Labs., Albuquerque, NM (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930540–3: 23. Institute of Electrical and Electronics Engineers (IEEE) photovoltaic specialists conference, Louisville, KY (United States), 10-14 May 1993). Order Number DE93014996. Source: OSTI; NTIS; GPO Dep.

The authors present a new cell concept (Emitter Wrap-Through or EWT) for a back-contact cell. The cell has laser-drilled vias to wrap the emitter on the front surface to contacts on the back surface and uses a potentially low-cost process sequence. Modeling calculations show that efficiencies of 18 and 21% are possible with large-area solar-grade multi- and monocrystalline silicon EWT cells, respectively.

1406 Photovoltaic Power Systems

26002 (DOE/CH/10093–190) **Photovoltaics: Program overview, fiscal year 1992.** National Renewable Energy Lab., Golden, CO (United States). Mar 1993. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93000055. Source: OSTI; NTIS; GPO Dep.

The US DOE's Photovoltaics program has helped photovoltaic technologies evolve from materials and concepts in the laboratories to competitive products rolling off automated assembly lines. This document is divided into the following sections: 1992 PV program accomplishments, expanding markets for photovoltaic systems, developing today's systems with utilities and industry, working with industry to advance the technology, cooperative research to improve materials and devices, selected achievements in cooperative R and D, and PV program services. Figs, tabs.

26003 (DOE/FTR–93012119) **[Travel to Guatemala to discuss plans to incorporate renewable energy technologies into rural electrification programs]: Foreign trip report, September 16, 1992–October 7, 1992.** Harcourt, M.M. II. Sandia National Labs., Albuquerque, NM (United States). 16 Oct 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012119. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Mr. Max Harcourt visited Guatemala City and Antigua, Guatemala. In Guatemala City, he met with the staff of the National Rural Electric Cooperative Association Central American Rural Electrification Support (NRECA/CARES) program, representatives of the United States Agency for International Development (US AID), representatives of the Ministry of Energy and Mines (MEM), and with the members of a Renewable Energy (RE) Working Group (WG) comprised of a Guatemalan utility (EEGSA), the University del Valle, and NRECA/CARES. The REWG has finalized plans for a village project using photovoltaics for lighting and water pumping and is proceeding with the project. The Ministry of Energy and Mines is still interested in a protocol of cooperation between them and the US agencies involved with renewable energy (DOE, the DAC, ECRE, and NRECA). A final draft of the protocol was reviewed on October 6, 1992, and is being staffed with the principle agencies. Discussions with US AID indicated a desire to create a regional renewable energy office in Guatemala City for the purpose of aiding and coordinating US efforts to identify and develop appropriate uses of RE technology and markets for US products in support of those projects. The REWG and NRECA were extremely pleased with the PV and Wind training held by the DAC in New Mexico in August 1992 and consider the project to have been a success. Further training opportunities were discussed and are being developed. In Antigua, Mr. Harcourt attended two weeks of intensive Spanish language training.

26004 (ETDE/JP-mf–93798905) **Prospect on new energies.: Photovoltaic power generation.** Institute of Applied Energy, Tokyo (Japan). Mar 1991. 24p. (In Japanese). Order Number DE93798905. Source: OSTI; NTIS; Available from The Institute of Applied Energy, 14-2, Nishishinbashi 1-chome, Minato-ku, Tokyo, Japan.

This paper reports surveys on photovoltaic power generation carried out by the General Energy Engineering Research Institute of Japan. Solar cells have been used already in hand-held calculators and traffic signals, and as power source to storage pumps in developing countries. Although the solar cell manufacturing cost has fallen largely, the cells could not be used practically unless the current high cost could be reduced by several fractions. Cost reduction in ancillary devices is also required. Silicon cells subjected to research works include monocrystalline, polycrystalline, and amorphous types, which are all under research for improvement. Its features may include limitless resource availability, high quality, no need of transporting and storing fuels, no generation of noise and harmful substances, long life, easy maintenance, capability of unattended operation, and constant generation efficiency regardless of plant sizes. Drawbacks lie in considerably low energy density in the solar beam, a necessity of inverters for the alternating current applications, and high cost under the present circumstances. A solar cell with a conversion efficiency of 30% has been announced in the U.S.A. 3 refs., 16 figs., 2 tabs.

26005 (PSI–126) **Albedo measurements and system investigation of a grid-connected photovoltaic plant on Mount Titlis.** Brack, M. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Wuillemin, D.; Durisch, W. Paul Scherrer Inst. (PSI), Villigen (Switzerland). May 1993. 62p. (In German). Order Number DE93505269. Source: OSTI; NTIS.

In 1988, at Titlis-Stand, an intermediate station on the cable railway 2,450 metres above sea level, a system-interconnected 2.4 kW photovoltaic installation was put into operation. At the request of the Federal Office of Energy, a detailed analysis of the whole installation has been under way for three-and-a-half years, carried out by the Paul Scherrer Institute since January 1989. The radiation reflected by the snow and soil and its effect on energy production were of particular interest. The report gives a summary of the results of the measuring work. figs., tabs., 21 refs.

26006 (SAND–92-2829C) **Recent advances in outdoor performance evaluation of PV systems.** Quintana, M.A. (Sandia National Labs., Albuquerque, NM (US)); King, D.L.; Cannon, J.E.; Woodworth, J.R.; Boyson, W.E.; Adams, N.P.; Ellibee, D.E. Sandia National Labs., Albuquerque, NM (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930540–2: 23. Institute of Electrical and Electronics Engineers (IEEE) photovoltaic specialists conference, Louisville, KY (United States), 10-14 May 1993). Order Number DE93015031. Source: OSTI; NTIS; GPO Dep.

Sandia's Photovoltaic Technology Laboratory (PTEL) routinely performs outdoor tests of a variety of one-sun and concentrator PV modules. The authors experience is that while outdoor testing has its own set of problems, it can produce results that are more directly applicable to "field" conditions than testing in solar simulators. They have recently improved both the hardware and software at the PTEL to improve their accuracy and to deal with the special set of problems encountered in outdoor testing. Improvements in hardware include a computer-controlled solar tracker that allows us to test arrays up to 21 m^2 in size; infrared imaging of modules; and electronic loads that allow us to test components with outputs up to 1,800 watts. Improvements in software include real-time monitoring of data collection; a relational data base that has improved the reliability of test setups, operations and analyses; and a standardized reporting process that relates module performance to a number of environmental parameters.

1407 Solar Thermal Power Systems

26007 (SAND–93-0229C) **High heat flux engineering in solar energy applications.** Cameron, C.P. Sandia National Labs., Albuquerque, NM (United States). 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930722–4: Annual meeting of the Society of Photo-Optical Instrumentation Engineers (SPIE), San Diego, CA (United States), 11-16 Jul 1993). Order Number DE93016500. Source: OSTI; NTIS; GPO Dep.

Solar thermal energy systems can produce heat fluxes in excess of 10,000 kW/m^2. This paper provides an introduction to the solar concentrators that produce high heat flux, the receivers that convert the flux into usable thermal energy, and the instrumentation systems used to measure flux in the solar environment. References are incorporated to direct the reader to detailed technical information.

26011 (ETSU-S–1160/16) **Solar building study. Final report: Cedargrove House, Chorley.** Solar Building Study. Hobday, R.A.; Pane, G.; Palmer, J.; Shaw, P. Databuild, Birmingham (United Kingdom). Mar 1992. 105p. Order Number DE93504498. Source: OSTI; NTIS (US Sales Only).

Work performed under the Energy Performance Assessments (EPA) Project.

This study is part of the Energy Performance Assessments Project sponsored by the Energy Technology Support Unit on behalf of the UK Department of Energy. The project aims to accelerate the uptake of low energy and passive solar design of buildings, through the use of field trials to assess energy, cost and amenity issues in occupied low energy passive solar buildings. The buildings chosen cover the range of UK latitudes and climates. Cedargrove House is a four bedroom detached, two storey house near Chorley, Lancashire. It has a two storey conservatory extending from the south facade. The total annual fuel use of 23320 kWh was low for a four bedroom dwelling. The space heating fuel requirement was 85 kWh/m^2 of gross floor area. The solar gain from the conservatory and south facing glazing can displace up to 25% of the heat required from the space heating system. The design of the house succeeded in providing a thermally comfortable and visually attractive environment and was well like by the occupants. The house cost 10% more to build than an equivalent non-solar house. This is attributable to the additional cost of the conservatory which provided valuable extra space and amenity benefits. (author)

26012 (ETSU-S–1160/18) **Solar building study. Final report: The Brune Park Sports Hall, Gosport.** Solar Building Study. Watkins, R.; Seager, A.; Palmer, J.; Shaw, P. Databuild, Birmingham (United Kingdom). Mar 1992. 121p. Order Number DE93504815. Source: OSTI; NTIS (US Sales Only).

Work performed under the Energy Performance Assessments (EPA) Project.

The energy performance assessment of Brune Park school's sports hall indicated that total annual delivered fuel, normalized for long term weather at the site, is moderately low at 195 kWh of delivered energy per m^2 gross floor area. Daylight has displaced 40% of the annual electricity used for lighting. The large saving in energy has been achieved without automatic lighting controls. The building is too warm for most of the year; the heating system is set too high and there is no significant means of rejecting unwanted solar heat. The poor air quality and lack of ventilation were complained of by users. The overall cost of the building is average for sports and recreational centres. The passive solar features have been incorporated at no extra cost. (author)

26013 (ETSU-S–1160/19) **Solar building study. Final report: The Mountbatten Sports Hall, Romsey.** Solar Building Study. Watkins, R.; Palmer, J.; Seager, A.; Shaw, P. Databuild, Birmingham (United Kingdom). Mar 1992. 115p. Order Number DE93504497. Source: OSTI; NTIS (US Sales Only).

Work performed under the Energy Performance Assessments (EPA) Project.

This study is part of the Energy Performance Assessments project sponsored by the Energy Technology Support Unit on behalf of the UK Department of Energy. The project aims to accelerate the uptake of designs of low energy passive solar buildings through field trials, to assess energy, cost and amenity issues in occupied low energy passive solar buildings. The buildings chosen cover the range of UK latitudes and climates. The distinctive passive feature of the Mountbatten Sports Hall at Ramsey, in Hampshire, is the extensive daylighting by means of roof lights. Daylight has displaced 21% of the annual electricity used for lighting by daytime adult use of the hall. The design has the potential to save twice this with better automatic lighting controls. Over-heating was not a significant problem. Recommended temperatures were exceeded, but few users complained of over-heating and this was only in the summer. Air quality was acceptable. Daylight alone provided poorer illumination at the centre of the hall than towards the edges. This reduced visibility at the centre of play. The overall cost of the building was slightly below the average for this type of recreational building. The roof-lights added 6,800 pounds to the cost, but enable 1,400 pounds of electricity to be saved per year for typical hours of use. (author)

26014 (ETSU-S–1160/21) **Solar building study. Final report: Paxton Court House, Sheffield.** Solar Building Study. Hobday, R.A.; Pane, G.; Palmer, J.; Brown, J.; Shaw, P. Databuild, Birmingham (United Kingdom). Mar 1992. 109p. Order Number DE93504499. Source: OSTI; NTIS (US Sales Only).

Work performed under the Energy Performance Assessments (EPA) Project.

This study is part of the Energy Performance Assessments Project sponsored by the Energy Technology Support Unit on behalf of the UK Department of Energy. The project aims to accelerate the uptake of low energy and passive solar design of buildings, through the use of field trials assess energy, cost and amenity issues in occupied low energy passive solar buildings. The buildings chosen cover the range of UK latitudes and climates. The house at Paxton Court in Sheffield is semi-detached with three bedrooms, loft and cellar. The main passive solar feature, is a conservatory running the full length of the south west facade and covering the ground and first floor. Total annual fuel use was estimated at 21277 kWh. Of this some 153 kWh/m^2 GFA was used for space heating, providing comfortable internal temperatures. This is a reasonable performance. Solar performance was promising with estimated solar gains of 1967 kWh over the heating season. This is equivalent to 20% of the space heating energy used. The occupants were very satisfied with the levels of comfort achieved in the house. The design was considered successful in all respects and it sold quickly when placed on the market. The house cost 9% more to build than an equivalent non-solar house. This can mainly be attributed to the cost of the conservatory which was skillfully integrated into the overall design. For the additional cost the conservatory provided energy and amenity benefits and an increase in floor space over the reference. (author)

26015 (ETSU-S–1160/26) **Solar building study. Final report: Christopher Taylor Court, Bournville, Birmingham.** Solar Building Study. Watkins, R.; Palmer, J.; Shaw, P.; Pane, G. Databuild, Birmingham (United Kingdom). Mar 1992. 113p. Order Number DE93504496. Source: OSTI; NTIS (US Sales Only).

Work performed under the Energy Performance Assessments (EPA) Project.

The Energy Performance Assessments project sponsored by the Energy Technology Support Unit on behalf of the Department of

Energy aims to accelerate the uptake of designs of low energy passive solar buildings through field trials to assess energy, cost and amenity issues in occupied low energy passive solar buildings. The buildings chosen cover the range of UK latitudes and climates. Christopher Taylor Court is a sheltered housing scheme for elderly people at Bournville, Birmingham. It consists of flats most of which have the living and bedroom windows facing south, with their north sides adjoining a corridor. The south facades incorporate glazed uninsulated walls with a selective surface to absorb solar energy. Total annual delivered fuel is 292 kWh per m^2 gross floor area. This is high for a building that is very well insulated. The building is unnecessarily warm; corridors are often at 25°C (the design temperature was 16°C); thermostats in most flats are set to 25°C or above. Poor control over the use of space heating has led to conditions which have almost obscured the impact of solar gain on the building. The mass walls have performed better than the well-insulated cavity walls used. They reduced heat loss by 25% during October to April. Detailed monitoring has suggested that solar gain contributes 5% of all the energy used to heat a flat. The total building cost was near the mean of a sample of similar reference buildings. Sliding doors and mass walls cost 17,000 pounds extra for the site. (author)

26016 (ETSU-S–1160/27) **Solar building study. Final report: Cockerell Grove House, Milton Keynes.** Solar Building Study. Hobday, R.A.; Pane, G.; Seager, A.; Palmer, J. Databuild, Birmingham (United Kingdom). Mar 1992. 106p. Order Number DE93504813. Source: OSTI; NTIS (US Sales Only).

Work performed under the Energy Performance Assessments (EPA) Project.

The results of an energy performance assessment carried out on the Cockerell Grove house are presented. The total measured annual fuel use of 16206 kWh, or 207 kWh/m^2 gross floor area, was low as was the space heating fuel use at 5762 kWh, or 74 kWh/m^2 gross floor area. Solar performance resulted in a measured solar contribution of 936 kWh, or 619 kWh for a typical year, from a combination of south facing glazing and a roofspace solar collector. The house was built for 5% more than an equivalent non-solar house of the same size, built to the same insulation standards. This cost difference can be attributed largely to the roof-space solar collector. The occupants liked the levels of daylight and impression of spaciousness created by the glazing on the south of the house. The combination of roof-space collector and heat recovery unit, as configured in the Cockerell Grove House, compromised the solar performance. (author)

26017 (ETSU-S–1160/30) **Solar building study. Final report: Britannia House, Hoylake.** Solar Building Study. Seager, A.; Evans, R.; Palmer, J.; Minikin, J. Databuild, Birmingham (United Kingdom). Mar 1992. 125p. Order Number DE93504812. Source: OSTI; NTIS (US Sales Only).

Work performed under the Energy Performance Assessments (EPA) Project.

An energy performance assessment was carried out to an old laundry that had been refurbished to form a new office building. Results indicated that the total annual fuel use for the building was reasonable at 271kWh/m^2 GFA, of which almost half was electricity. This includes the air conditioning plant which was used to maintain comfort conditions through the year. The refurbishment was successful in producing a design with passive solar potential, however a lack of consideration to controls meant that the potential was largely unrealised. Solar Gains contributed 8% of the buildings total heating requirement. The office is well liked by most occupants who rated it as pleasant and likeable. The refurbishment cost was estimated at 643/m^2 pounds, however higher insulation standards could have been incorporated at little additional cost. (author)

26018 (ETSU-S–1163/29) **Solar building study. Final report: Albert Hall Memorial Housing, Coalville, Leicestershire.** Solar Building Study. Vaughan, N.; Jones, P.; Alexander, D.; Jenkins, H.; Fedeski, M.; Lannon, S. University of Wales Coll. of Cardiff (United Kingdom). Welsh School of Architecture. Jan 1992. 131p. Order Number DE93504814. Source: OSTI; NTIS (US Sales Only).

Work performed under the Energy Performance Assessments (EPA) Project.

The main components of an energy performance assessment (EPA) of this sheltered housing involved measured energy; modelled energy; reference energy; measured amenity and environment, and operator study; modelled cost; and reference cost. The total annual fuel use of 12403 kWh was found to compare very well with that of a well insulated non-solar design. This good energy performance is due principally to the building's well scaled and insulated envelope, rather than to its passive design. (author)

26019 (ETSU-S–1219-P4) **BREDEM-8 parametric study into the potential energy saving from passive solar house design.** Orrell, R. NBA Tectonics, London (United Kingdom). Dec 1992. 16p. Contract E/5 CON 1219/1849. Order Number DE93504799. Source: OSTI; NTIS (US Sales Only).

Passive solar can help to realise energy savings in housing through a conscious intent to make optimum use of the free energy available from the sun. By designing for increased solar utilisation the demands on the conventional heating system can be reduced. The designer needs to consider both the design of the house (the glazing area, its distribution around the facades and the internal arrangement of rooms) as well as the site design (the orientation of houses for maximum solar gains into the rooms with the greatest heating demand and the positioning of houses within their plots for minimal overshadowing). (author)

26020 (ETSU-S–1352) **Evaluation of passive solar potential multi-residential dwellings and domestic retrofit measures.** Bown, H. NBA Tectonics, London (United Kingdom). 1993. 110p. Order Number DE93504518. Source: OSTI; NTIS (US Sales Only).

A number of measures are identified from which a total energy saving of 40.7 PJ might be realised by the year 2030, of which 32.6 PJ is accounted for by one large measure. The potential is defined as the potential which might be achieved by encouragement from the passive solar programme over and above what will be achieved in the natural course of events without that encouragement. Attention is drawn to current interest in transparent insulating materials. They raise technical issues now being investigated, but if the technical problems can be overcome and costs significantly reduced they may have great potential in retrofit measures. (Author)

26021 (ETSU-S–1362) **House design studies: Overview.** Boss, A.; Orbasli, A.; Sutcliffe, S. York Univ. (United Kingdom). Inst. of Advanced Architectural Studies. Dec 1992. 300p. Contract E/5A/1362/2715. Order Number DE93504517. Source: OSTI; NTIS (US Sales Only).

The results documented in this overview are based on reports of 43 passive solar house designs. The designs were commissioned by the Energy Technology Support Unit (ETSU) as part of the Department of Trade and Industry Passive Solar Programme. Each report is a study of three houses and their relative energy performance as modelled using the thermal simulation programme SERI-RES. The three are a designed passive solar house, a standard developer's house of equivalent size and accommodation and built to 1990 Building Regulation thermal standards, and the same developer's house but with the level of fabric insulation increased to the same specification as the designed passive solar house. The standard developer's house, in both its forms, is provided as a point of comparison for the design house. The results of this study fall broadly into two groups: those which relate to the energy performance of the designs and those which relate to the commercial acceptability of the designs. (Author)

26022 (NEI-DK–1213) **Solar heating system for space heating and domestic water supply: "Ans solvarme". Validation of KVIKSOL.** Nielsen, J.E. Dansk Teknologisk Inst., Taastrup (Denmark). Proevestationen for Solenergi. Mar 1992. 45p. (In Danish). Contract TR-87.080. Order Number DE93500369. Source: OSTI; NTIS.

Measurements from a solar heating system for space heating and heating of domestic hot water using calculations carried out by a computer programme designated "KVIKSOL" are presented. The system comprises a solar collector measuring 13 cubic meters and storage capacity of 650 liters. The programme proved to be satisfactory. Variations of design and consumption were investigated and some rules for dimensioning this type of system were set up. These are that there ought to be a need for space heating during

the summer and/or a need for hot water of at least 20 liters daily per square meter of solar collector. Regarding the area of the solar collector, 1 square meter should give 2000 kWh annually (total consumption), the angle of the collector should be 50-60 degrees and the storage volume should be 40-50 liters per square meter solar collector. If these rules are followed in relation to the described type of system the same production can be achieved per square meter solar collector and for a well dimensioned domestic water system, and at the same time a double coverage of heating needs will be gained. (AB).

26023 (NEI-DK–1220) **Operational experience of spandrel solar walls: Partial report 1: Measurements on the improved construction. Duevej in Struer.** Andersen, N.B. (Dansk Teknologisk Institut, Taastrup (Denmark)); Genborg, T.; Falck, U. Dansk Teknologisk Inst., Taastrup (Denmark). Energiteknologi; Talck's (U.) Tegnestue, Frederiksberg (Denmark). Mar 1992. 19p. (In Danish). Contract ENS-51181-91.0007. Order Number DE93500319. Source: OSTI; NTIS.

The existing and the planned altered construction of a spandrel wall in which the solar walls are integrated in a house situated in Struer, Denmark are evaluated in addition to the absorbent materials used. The protective measures against the occurrence of too high temperatures are described. The results of the temperature measurements are included. (AB).

26024 (NEI-DK–1221) **Operational experience of spandrel solar walls: Partial report 2: Evaluation of energy yield for solar walls that preheat fresh air. Duevej in Struer.** Andersen, N.B. (Dansk Teknologisk Institut, Taastrup (Denmark)); Genborg, T.; Falck, U. Dansk Teknologisk Inst., Taastrup (Denmark). Energiteknologi; Talck's (U.) Tegnestue, Frederiksberg (Denmark). May 1992. 25 p.p. (In Danish). Contract ENS-51181-91.0007. Order Number DE93500325. Source: OSTI; NTIS.

Alterations had made in the construction of the spandrel solar walls and protective measures against overheating of the construction had been taken in a house situated in Struer, Denmark. Measured data on temperature, energy yields, costs etc. are presented and evaluated. Stagnation temperatures are also given. A computer programme for the calculation of the heating yield is described and an evaluation of capacity based on air volume flow measurements in the solar wall is presented. (AB).

26025 (NREL/TP–471-5536) **Reflective coatings for solar applications.** Jorgensen, G. National Renewable Energy Lab., Golden, CO (United States). May 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. (CONF-9304149–1: 36. annual Society of Vacuum Coaters technical conference, Dallas, TX (United States), 27-29 Apr 1993). Order Number DE93010026. Source: OSTI; NTIS; GPO Dep.

Many applications of solar energy require large mirrors to provide high levels of concentrated sunlight. The success of such conversion systems hinges on the optical durability and economic viability of the reflector materials. A major effort at the National Renewable Energy Laboratory (NREL) has been to improve the existing reflector materials technology and to identify candidates that retain optical performance and durability criteria and offer potential for reduced cost. To attain the goals, it is desirable to maintain and increase the involvement of industrial organizations in reflective materials R&D related to the conversion of solar resources to useful energy. Toward this end, NREL has recently initiated several collaborative efforts with industry to develop advanced reflector materials.

26026 (SAND–92-2789C) **Revisiting the BCS, a measurement system for characterizing the optics of solar collectors.** Strachan, J.W. Sandia National Labs., Albuquerque, NM (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930561–6: 39. international instrumentation symposium, Albuquerque, NM (United States), 2-6 May 1993). Order Number DE93015030. Source: OSTI; NTIS; GPO Dep.

The Beam Characterization System is being employed at the Sandia's National Solar Thermal Test Facility to characterize the optical performance of heliostats, point-focus solar collectors, and their optical sub-elements as part of the on-going task to develop solar thermal technologies. With this measurement system, images of concentrated solar flux are acquired using digital imaging and processed to obtain such measures of the collector's optical performance as beam power, flux distribution, and beam diameter. Key system elements are a diffusely reflective target for imaging collector beams, meteorological instrumentation including a flux gauge to measure flux at one point in the beam, and a calibration technique to establish a pixel-intensity-to-flux-density conversion factor for the image. The system is employed in a variety of collector tests such as beam quality, tracking error, and wind effects. The paper describes the Beam Characterization System and its components and presents, for illustration, sample test results. An analysis of the Beam Characterization System's sources of measurement error is presented. Lastly, measurement techniques that employ the BCS to align heliostats and to measure or estimate collector surface slope errors are described.

26027 (SAND–92-2831C) **Progress in the Concentrator Initiative Program.** Maish, A.B. Sandia National Labs., Albuquerque, NM (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930540–8: 23. Institute of Electrical and Electronics Engineers (IEEE) photovoltaic specialists conference, Louisville, KY (United States), 10-14 May 1993). Order Number DE93015006. Source: OSTI; NTIS; GPO Dep.

Progress made by the eight participating cell and collector manufacturers since the beginning of the US Department of Energy's multiyear photovoltaic Concentrator Initiative program is reviewed. Point and line-focus cell manufacturers achieved peak efficiencies between 19% and 25% with designs that could be manufactured commercially. Collector manufacturers delivered prototype hardware of point and line-focus collectors representing commercially producible technology.

26028 (ETSU-R–59) **Geothermal hot dry rock: UK Government R and D programme 1976-1991.** AEA Environment and Energy, Harwell (United Kingdom). 1992. 108p. Order Number DE93503573. Source: OSTI; NTIS (US Sales Only).

The Energy Technology Support Unit has been responsible since 1976 for the management of the UK Government's R and D Programme on geothermal hot dry rock, funded through the Department of Energy's Renewable Energy Programme. The aim has been to assess the technical and economic feasibility of the hot dry rock concept for commercial application and to conduct a full scale field trial, in collaboroation with industry, by the mid 1990s. Teams engaged on this work were from university, polytechnic, industry and government research laboratories, supported by engineering contractors and consultants. The Programme to date has cost 42M pounds, of which the Commission of the European Communities has contributed 3M pounds. Details of the work are available in many reports and are reviewed in this document. They show that the geological and other factors involved in the creation of hot dry rock electricity generating systems are now much better understood and the size and distribution of the resource has been established. There has also been a major increase in knowledge of the relevant economic and risk factors which has shown that the early promise of the technology is unlikely to be fulfilled in the UK in the short or medium term. The main experimental work for the R and D Programme was carried out at Rosemanowes Quarry, near Falmouth in Cornwall, by the Camborne School of Mines. (author)

Alamos National Lab., NM (United States). Apr 1993. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93014452. Source: OSTI; NTIS; INIS; GPO Dep.

Hot Dry Rock technology took a giant leap forward this year as the long-awaited long-term flow test (LTFT) of the Phase 2 HDR reservoir at Fenton Hill got underway. Energy was produced on a twenty-four hour a day basis for a continuous period of nearly four months of steady-state testing. Hot water was brought to the surface at 90–100 gallons per minute (gpm) with temperatures of 180°C (356°F) and higher. During that time, the HDR plant achieved an on-line record of 98.8%. Surface temperature measurements and temperature logging deep within the wellbore confirmed that no decline in the average temperature of fluid produced from the reservoir occurred. Tracer experiments indicated that flow paths within the reservoir were undergoing continuous change during the test. Remarkably, it appeared that longer flow paths carried a larger proportion of the flow as the test proceeded, while more direct fluid pathways disappeared or carried a significantly reduced flow. In sum, access to hot rock appeared to improve over the span of the test. Water losses during the test averaged 10–12% and showed a slow long-term decline. These results confirmed what had been previously discovered in static pressurization testing: Water consumption declines significantly during extended operation of an HDR reservoir. In combination with a recent demonstration by the Japanese that water losses can be greatly reduced by the proper placement of multiple production wells, the recent results at Fenton Hill have effectively demonstrated that excessive water consumption should not be an issue for a properly engineered HDR facility at a well chosen site.

Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93016635. Source: OSTI; NTIS; GPO Dep.

Thermodynamic properties of pore water are shown to be different from those of bulk water because of interfacial forces between the aqueous and solid phases. This "vapor-pressure lowering" (VPL) effect is described through Kelvin's equation, which relates VPL to properties of the liquid phase. An algorithm that accounts for VPL had previously been implented in the geothermal simulator TETRAD. This algorithm applies to a narrow range of reservoir properties, and in some cases leads in inconsistencies. This report presents a generalization of the VPL algorithm which removes many of its limitations. The governing equations for the generalization are presented, assumptions and limitations of the method are discussed, and the modifications are validated.

26033 (ETDE/JP-mf–93799057) **No.30 survey report on promotion of geothermal energy development in 1991.: Survey of environmental effects of fumarolic gas in the Hakkodo area.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Jan 1993. 31p. (In Japanese). Order Number DE93799057. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

The paper investigates how hot springs are affected by drilling of environmental survey wells and blowout/injection of geothermal fluids which are incidental to the geothermal energy development in the Hakkoda west area. Hot springs for survey are classified as follows: Sukayu hot springs; acidity-containing Al-Ca-SO4 spring, Jogakura No.2 spring, Na-HCO3·Cl-SO4 type simple spring, Jogakura No.3 spring; alcaline/Na-HCO3 type simple spring, Kansuizawa hot spring; Na-HCO3, Cl spring. As compared with the environmental survey in fiscal 1989 before blowout, the hot springs except Jogakura No.3 spring were relatively smaller in variations and brought almost stabilized results. Moreover, large variations in each survey item relating to Jogakura No.3 spring agreed with those at the time of stopping pumping facilities due to reduction in output of hot water, and it is hard to think that it was caused by drilling of geothermal exploratory wells. Accordingly, there are seen no effects of drilling for geothermal exploration on the neighboring hot springs. For geothermal survey, however, it is desirable to investigate hydrologic structures and then to take measures such as injection of all geothermal water into the depth of the underground. 4 refs., 13 figs., 7 tabs.

26034 (ETDE/JP-mf–93799058) **No.31 survey report on promotion of geothermal energy development in 1991.: Survey of environmental effects of fumarolic gas in the Iwatesan west area.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Jan 1993. 37p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93799058. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

The paper investigates hot springs in fumarolic gas in the Iwatesan west area, and evaluates effects of regional development on the neighboring environment. Details of each spring are as follows: PH, total evaporation residue, and quality of spring are 7.8, 2190mg/l, and Ca·Mg-HCO3·SO4 spring for Water well No.18; 7.4, 1285mg/l, and Na-HCO3· Cl spring for Genbu hot spring; 7.6, 471mg/l, and Na·Ca-HCO3 type simple spring for Nukumori hot spring; 2.9, 461mg/l, and acidity-Ca-SO4 type simple spring for Matsukawa hot spring, respectively. Variations are smaller than those in fiscal 1989. Only Matsukawa hot spring is large in variation in output of hot water, but a coefficient of its correlation with precipitation is 0.38. Anyhow, when installing a geothermal power

plant, it is necessary to make investigations on injection of geothermal water into the underground, hydrologic structures, etc. and to give careful consideration to the effect of the development on sources of hot spring. 6 refs., 6 figs., 8 tabs.

26035 (ETDE/JP-mf–93799059) **No.36 survey report on promotion of geothermal energy development in 1991.: Survey of environmental effects before fumarolic gas in the Amemasudake area.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Jan 1993. 200p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93799059. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

The paper investigates hot springs in fumarolic gas in the Amemasudake area, and evaluates effects of regional development on the neighboring environment. At all inspection points, volumes of H2S, SO2 and suspended particulate are below detection limit values. Hg is detected by 0.015μg/m^3, which is not so high as compared with measuring data obtained in the geothermal zone. Water quailty of the rivers at each point is a little bit high in BOD, but good. For installation of the geothermal power plant, it is necessary to take measures to eliminate effects on quality of river water such as proper treatment of drilled soil/sludge and injection of geothermal water into the underground. It is considered that installation of the geothermal power plant produces no large effects on environments for growth/inhabiting of plants and animals, but it is desired to give consideration to the development such as making the deforestation area necessary and minimum. Measures aiming at harmony with forest landscape should be taken for installation of the plant. It is necessary to conduct investigations on water quality and hydrologic structures and to give careful consideration to the effect of production and underground injection of geothermal fluids on the existing hot springs. 16 refs., 44 figs., 53 tabs.

26036 (ETDE/JP-mf–93799060) **No.37 survey report on promotion of geothermal energy development in 1991.: Survey of environmental effects before fumarolic gas in the Hongu area.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Jan 1993. 189p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93799060. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

The paper investigates effects of geothermal energy exploration activities on the environment in the Hongu area, and evaluates the present status of environmental factors necessary before the development. H2S, CO2 and Hg are not detected at all, and suspended particulate is 217-488μg/m^3, which is higher than the environmental standard of suspended particulate matters. At all survey points, water quality is on the same level as that of general rivers. As environmental indices, 25 biological species are recognized. With regard to the landscape of the survey area, beautiful fresh verdure is viewed in spring, but colored levels are hardly seen in fall because there are many evergreen conifers. Among spring sources, Tamanoyu, Tatsunoyu and Oguriyu are a self-erupting spring, and Shigenoyu, Fujiyu and Iimori spring source are a pumping spring. Those are 66-92°C in spring temperature and 16-300l/min in output of hot water, and 6.8-7.7 in PH which is alkalescent. Quality of the spring is Na-HCO3-Cl. They are small in variations and relatively stable. Since sources of each spring is thought to exist in the shallow underground, it is desired to inject hot water into the underground for geothermal development. 13 refs., 39 figs., 57 tabs.

26037 (ETDE/JP-mf–93799061) **No.38 survey report on promotion of geothermal energy development in 1991.: Survey of environmental effects before fumarolic gas in the Mt. Aso west area.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Jan 1993. 211p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93799061. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

The paper evaluates effects of geothermal energy exploration activities on the environment in the Mt. Aso west area. At survey points, H2S and SO2 are detected. Hg is 0.002-0.038μg/m^3. Quality of river water is pure at each point. Most of the survey area is occupied by substitutional community like grassland, afforestation, etc. For geothermal development, it is necessary to pay attention to protection of regions where natural vegitation is distributed and to make the deforestation area necessary and minimum. If the geothermal power plant is installed, it contributes further to the region in terms of employment and finance based on the development of the local industry. It is estimated that the five hot springs surveyed are formed by heating of the ground water which originates in rain water or heating of the meteoric water which permeates the underground, by means of vapor containing CO2 and H2S. For the development, it is necessary to take measures to inject all output of geothermal water into the deep underground. 20 refs., 43 figs., 54 tabs.

Research projects are described in the following areas: geothermal exploration, mapping reservoir properties and reservoir monitoring, and well testing, simulation, and predicting reservoir performance. The objectives, technical approach, and project status of each project are presented. The background, research results, and future plans for each project are discussed. The names, addresses, and telephone and telefax numbers are given for the DOE program manager and the principal investigators. (MHR)

Field tests and studies were conducted to determine the production behavior of geopressured-geothermal reservoirs and their potential as future energy sources. Results are presented for Gladys McCall Site, Pleasant Bayou Site, and Hulin Site.

26041 (DOE/ID/12578–3-Vol.2) **Flow tests of the Gladys McCall well: Appendix A, Gladys McCall Site (Cameron Parish, LA): Final report, October 1985–October 1990.** Randolph, P.L. (Institute of Gas Technology, Chicago, IL (United States)); Hayden, C.G.; Rogers, L.A. Eaton Operating Co., Inc., Houston, TX (United States); Institute of Gas Technology, Chicago, IL (United States). Apr 1992. 486p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-85ID12578. Order Number DE93016252. Source: OSTI; NTIS; GPO Dep.

This report pulls together the data from all of the geopressured-geothermal field research conducted at the Gladys McCall well. The well produced geopressured brine containing dissolved natural gas from the Lower Miocene sands at a depth of 15,150 to 16,650 feet. More than 25 million barrels of brine and 727 million standard cubic feet of natural gas were produced in a series of flow tests between December 1982 and October 1987 at various brine flow rates up to 28,000 barrels per day. Initial short-term flow tests for the Number 9 Sand found the permeability to be 67 to 85 md (millidarcies) for a brine volume of 85 to 170 million barrels. Initial short-term flow tests for the Number 8 Sand found a permeability of 113 to 132 md for a reservoir volume of 430 to 550 million barrels of brine. The long-term flow and buildup test of the Number 8 Sand found that the high-permeability reservoir connected to the wellbore (measured by the short-term flow test) was connected to a much larger, low-permeability reservoir. Numerical simulation of the flow and buildup tests required this large connected reservoir to have a volume of about 8 billion barrels (two cubic miles of reservoir rock) with effective permeabilities in the range of 0.2 to 20 md. Calcium carbonate scale formation in the well tubing and separator equipment was a problem. During the first 2 years of production, scale formation was prevented in the surface equipment by injection of an inhibitor upstream of the choke. Starting in 1985, scale formation in the production tubing was successfully prevented by injecting inhibitor "pills" directly into the reservoir. Corrosion and/or erosion of surface piping and equipment, as well as disposal well tubing, was also significant.

26042 (DOE/ID/12578–3-Vol.4) **Testing of the Pleasant Bayou Well through October 1990: Final report, October 1985–October 1990.** Randolph, P.L.; Hayden, C.G.; Mosca, V.L.; Anhaiser, J.L. Eaton Operating Co., Inc., Houston, TX (United States); Institute of Gas Technology, Chicago, IL (United States). Aug 1992. 487p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-85ID12578. Order Number DE93016254. Source: OSTI; NTIS; GPO Dep.

Pleasant Bayou location was inactive from 1983 until the cleanout of the production and disposal wells in 1986. The surface facilities were rehabilitated and after shakedown of the system, additional repair of wellhead valves, and injection of an inhibitor pill, continuous long-term production was started in 1988. Over two years of production subsequent to that are reviewed here, including: production data, brine sampling and analysis, hydrocarbon sampling and analysis, solids sampling and analysis, scale control and corrosion monitoring and control.

26043 (DOE/ID/12578–3-Vol.5) **Flow tests of the Willis Hulin well: Appendix C, Willis Hulin Site: Final report, October 1985–October 1990.** Randolph, P.L.; Hayden, C.G.; Rogers, L.A. Institute of Gas Technology, Chicago, IL (United States); Eaton Operating Co., Inc., Houston, TX (United States). Feb 1992. 127p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-85ID12578. Order Number DE93016255. Source: OSTI; NTIS; GPO Dep.

The Hulin well was tested between 20,100 and 20,700 feet down in layers of brine-saturated clean sand with occasional intervening layers of shale. The characteristics of the brine and gas were determined in this interval and an initial determination of the reservoir properties were made.

26044 (DOE/NV/10412–5) **Consolidated Research Program, United States Gulf Coast Geopressured-Geothermal Program: First quarterly report, January 1, 1993–March 3, 1993.** Texas Univ., Austin, TX (United States). Center for Petroleum and Geosystems Engineering. Jun 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC07-85NV10412. Order Number DE93015588. Source: OSTI; NTIS; GPO Dep.

Water influx calculations for the Gladys McCall reservoir were conducted based on three commonly applied water influx models. Results are shown graphically. Work on geologic studies was summarized.

26045 (ETSU-G–151-P8) **Techniques for the correction of short circuit effects on HDR reservoirs: Camborne Geothermal Energy Project.** Parker, R.H. (ed.). Camborne School of Mines (United Kingdom). Geothermal Energy Project. 1992. 117p. Order Number DE93504501. Source: OSTI; NTIS (US Sales Only).

A flow path, or a combination of flow paths, which results in preferential flow through a specific region of a hot-dry-rock (HDR) reservoir, will lead to premature thermal drawndown. Methods of handling such short circuits have been the objective of the work at the Rosemanowes reservoir, Cornwall, UK, covered by this report. Active seismic surveys, cross-hole resistivity measurements, downhole geochemical sampling and developments in a high temperature borehole televiewer have been assessed as methods of characterising flow paths, and thus identifying short circuits. The development and demonstration of downhole tracer techniques are reviewed. A multi-chambered sampling tool is being developed, and equations have been formulated for downhole injected tracer data to calculate the distribution of flow recovery and losses between the flow exits from an injection well. The use of reactive tracers at Rosemanowes has been seriously impeded by the presence of bacteria in the system. Bacteria have been shown to produce a reducing environment in the reservoir when carbohydrate gels are used as stimulation fluids. A single well tracer test has been carried out, and results indicate that the hydraulic behaviour of the well is not the same on injection as it is during venting. A possible means has been identified, whereby the thermal performance of a preferential flow path might be predicted using the same downhole tracer data used to identify its location. It has not been possible to demonstrate a sealant in the current Rosemanowes reservoir, apart from simple mechanical isolation of part of the wellbore, however, information has been gathered about the potential use of sealants. (author)

26046 (ETSU-G–151-P10) **Camborne geothermal energy project. Characterisation of the Rosemanowes HDR reservoir: (Report 3A-10).** Parker, R.H. (ed.). Camborne School of Mines (United Kingdom). Geothermal Energy Project. 1992. 180p. Sponsored by AEA Environment and Energy, Harwell (United Kingdom). Order Number DE93797876. Source: OSTI; NTIS (US Sales Only).

The main basis for the creation and circulation of experimental HDR reservoirs is to establish general relationships between fundamental HDR reservoir parameters (eg rock volume, well separation, permeability, chemical reaction rates) and the three main performance parameters; thermal performance, hydraulic impedance and water loss. This research is concerned with the establishment of such relationships. (author)

26047 (ETSU-G–151-P11) **Modelling and design of HDR reservoir creation: Camborne Geothermal Energy Project.** Parker, R.H. (ed.). Camborne School of Mines (United Kingdom). Geothermal Energy Project. 1992. 136p. Grant E/5A/CON/151/2034. Order Number DE93504500. Source: OSTI; NTIS (US Sales Only).

Four Fluid Rock Interaction models, used at the Camborne School of Mines Geothermal Energy Project, have been developed to assist in achieving the objective of validating the feasibility of creating a hot-dry-rock (HDR) reservoir suitable for commercial operation, including the concept of multi-stimulation. These models of differing degrees of complexity contribute specifically towards: (a) the development and verification of a numerical, three-dimensional model of the behaviour of jointed rock systems, for use in the stimulation design studies; (b) modelling the proposed stimulation procedures and determining the feasibility of reservoir creation and its sensitivity to the main stimulation parameters, including joint distribution, rock stress conditions, stimulation fluid properties, and pumping pressure and durations. Many possibilities for the enhancement of these models still remain. These would aim to improve their capabilities, both computationally and in the range of problems that can be modelled. Currently though, all these models are capable of simulating aspects of the stimulation process, from the hydraulic stimulation of a single fracture to the creation of a complete geothermal reservoir. They have been used to predict the structure and efficiency of a geothermal reservoir under different stimulation conditions. The reservoir structure is found to be extremely sensitive to many of the input parameters, such as the stress field and joint distribution. This accentuates the current difficulty in making accurate predictions of reservoir performance, whilst physical uncertainties are great. (author)

26048 (SAND–93-1271C) **Status of lost circulation research.** Glowka, D.A.; Schafer, D.M.; Wright, E.K.; Whitlow, G.L.; Bates, C.W. Sandia National Labs., Albuquerque, NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930484–6: Geothermal program review, Berkeley, CA (United States), 27-29 Apr 1993). Order Number DE93015659. Source: OSTI; NTIS; GPO Dep.

This paper describes progress made in the Lost Circulation Technology Development Program over the period March, 1992–April, 1993. The program is sponsored at Sandia National Laboratories by the US Department of Energy, Geothermal division. The goal of the program is to develop technology to reduce lost circulation costs associated with geothermal drilling by 30–50%.

1510 Direct Energy Utilization

26049 (ETDE-IT–93-154) **Utilization of low temperature geothermal water in traditional and advanced agricultural applications.** Rossi, L.; Pacciaroni, F. ENEA, Casaccia (Italy). 1992. 8p. (CONF-9210372–1: Workshop on the rational use of energy, Budapest (Hungary), 27-29 Oct 1992). Order Number DE93799182. Source: OSTI; NTIS (US Sales Only); INIS.

The locations of large amounts of low temperature geothermal sources (30 to 80 degrees C) have been identified in Italy and in many European countries; one of the most interesting utilization of these sources is greenhouse heating. Surplus investment in comparison with conventional heating systems is justified only by the application of low cost technologies for well completion, heating distribution and waste heat treatment. In the last few years, many efforts have been made in the development of these technologies and selection of more profitable crops. Since 1984, ENEA (Italian Agency for Energy, New Technologies and the Environment) has carried out experimental work in two geothermal stations located in Canino (VT) and in Gorgo di Latisana (UD). In these plants, a number of greenhouses enveloped with plastic film are provided with different heating systems; the combination of soil and forced air heating is preferred. Plastic pipes, buried in the soil, are used as soil heating for horticulture and fruit production. For plot plant cultivation, soil heating is obtained by plastic pipes half-buried in a concrete floor. Asparagus cultivation is carried out with buried pipes. No additional heating with conventional fuel is provided in any greenhouse. During these years, ENEA has developed heating and water distribution technologies: current industrial components are generally utilized. Moreover, ENEA has recently completed an advanced automatic control system able to control geothermal greenhouses, manage water distribution, save energy and optimize environmental conditions.

1520 Geothermal Data and Theory

26050 (DOE/ER/13419–T2) **[Diffusion/dispersion transport of chemically reacting species]: Progress report, FY 1992–1993.** Helgeson, H.C. California Univ., Berkeley, CA (United States). Dept. of Geology and Geophysics. [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-85ER13419. Order Number DE93017553. Source: OSTI; NTIS; GPO Dep.

Progress is reported on the following: calculation of activity coefficients for aqueous silica in alkali metal chloride solutions; calculation of degrees of formation of polyatomic clusters of Al in alkali chloride solutions; bulk composition-pH diagrams for arkosic sediments; and chemical interaction of petroleum, oil field brines, and authigenic mineral assemblages. Plans for future research are given.

26051 (DOE/ID/12945–T10) **A study of hydrocarbons associated with brines from DOE geopressured wells: Final report.** Keeley, D.F. University of Southwestern Louisiana, Lafayette, LA (United States). Acadiana Research Lab. [1993]. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC07-90ID12945. Order Number DE93016285. Source: OSTI; NTIS; GPO Dep.

Accomplishments are summarized on the following tasks: distribution coefficients and solubilities, DOE design well sampling, analysis of well samples, review of theoretical models of geopressured reservoir hydrocarbons, monitor for aliphatic hydrocarbons, development of a ph meter probe, DOE design well scrubber analysis, removal and disposition of gas scrubber equipment at Pleasant Bayou Well, and disposition of archived brines.

16 TIDAL AND WAVE POWER

1604 Economic, Industrial, and Business Aspects

1607 Tidal Power Plants

26052 (ETSU-T–05-00155/REP) **Tidal stream energy review.** Engineering and Power Development Consultants Ltd., Sidcup (United Kingdom); Binnie and Partners, Redhill (United Kingdom); McAlpine (Sir Robert) and Sons Ltd., London (United Kingdom); IT Power, Eversley (United Kingdom). 1993. 100p. Order Number DE93504807. Source: OSTI; NTIS (US Sales Only).

Around the coasts of the British Isles there are sea areas with high velocity currents so that installations which could harness the energy might appear attractive. Two main problems exist: the difficulty of construction in the strong currents and the dispersion of energy, requiring large and expensive devices. A previous review of the subject had been carried out for the Energy Technology Support Unit in 1979 but it was considered appropriate to up-date the work in the light of presently available technology. Following submissions at the end of 1991, a review study was commissioned in March 1992 by ETSU. The aims of the study were essentially two-fold: to review the status of the technology for obtaining energy from tidal streams and to estimate the UK tidal stream energy resources and the likely costs of the energy which could be generated. (author)

26053 (ETSU-T–05-00155/REP-A) **Tidal stream energy review: Appendices.** Engineering and Power Development Consultants Ltd., Sidcup (United Kingdom); Coventry Univ. (United Kingdom); McAlpine (Sir Robert) and Sons Ltd., London (United Kingdom); IT Power Ltd., Eversley (United Kingdom). 1993. 214p. Order Number DE93506442. Source: OSTI; NTIS (US Sales Only).

This review gives an initial database search list; abstracts of references in secondary search; references of support structures; and documents received from ETSU relating to moorings and anchorages. A review of library material with regard to turbine plant is presented as well as electrically relevant literature and oceanographic references. Basic axial flow turbine sizing analysis is outlined, and sites for possible tidal stream energy generation are listed. (author)

1608 Wave Energy Converters

26054 (ETSU-WV–1685) **A parametric costing model for wave energy technology.** Atkins Oil and Gas Engineering Ltd., London (United Kingdom). 1992. 149p. Order Number DE93504797. Source: OSTI; NTIS (US Sales Only); INIS.

This document describes the philosophy and technical approach to a parametric cost model for offshore wave energy systems. Consideration is given both to existing known devices and other devices yet to be conceptualised. The report is complementary to a spreadsheet based cost estimating model. The latter permits users to derive capital cost estimates using either inherent default data or user provided data, if a particular scheme provides sufficient design definition for more accurate estimation. The model relies on design default data obtained from wave energy device designs and a set of specifically collected cost data. (author)

26055 (ETSU-WV–1690-P1) **Reliability and availability assessments of wave energy devices: Main report.** Advanced Mechanics and Engineering Ltd., Guildford (United Kingdom).

1992. [197p.] Order Number DE93504802. Source: OSTI; NTIS (US Sales Only).

The viability of a wave energy device is primarily dependent on the delivered cost of the electricity that it generates through its service life. The delivered cost of the electricity is in turn dependent on the capital cost of the device, the cost of maintaining and repairing the device and the quantity of electricity delivered throughout its lifetime. The through-life repair costs of a device and the quantity of electricity that it will deliver are in turn dependent on the reliability on the mechanical and electrical components that make up the device. The work reported on here has been undertaken with the objective of establishing some of the quantities needed for the calculation of the delivered cost of the electricity generated by each device. (author)

26056 (ETSU-WV–1690-P2) **Reliability and availability assessments of wave energy devices: Supporting appendices.** Advanced Mechanics and Engineering Ltd., Guildford (United Kingdom). 1992. 448p. Agreement E/5A/1690/2587. Order Number DE93504503. Source: OSTI; NTIS (US Sales Only).

Advanced Mechanics and Engineering Ltd. has been commissioned by the United Kingdom Energy Technology Support Unit (ETSU) to perform analyses leading to an assessment of the reliability and availability of four types of wave energy devices, viz: the Edinburgh Duck; the NEL Oscillating Water Column (Bottom Standing Terminator); the Bristol Cylinder; and the Circular SEA-Clam. This document contains the background documentation prepared during the course of the study and largely contained in the supporting appendices. (author)

26057 (ETSU-WV–1691) **Frame design options for a circular clam wave energy device.** Coventry Polytechnic Enterprises Ltd. (United Kingdom). 1992. 84p. Contract A/5A/1691/2642. Order Number DE93504806. Source: OSTI; NTIS (US Sales Only).

This report follows on from development work on the Circular Clam by Coventry Polytechnic between 1983 and 1986. It implements the recommendations of the Department of Energy report in 1986 that the reference frame should be further developed. Steel and concrete hull concepts were developed to a sufficient stage to allow budget costing. The original 1986 tubular steel frame concept was rejected by comparison of the weights and relative costs of the structure with the steel hull scheme. The steel hull section design was based on the side buoyancy space of a hopper dredger which it resembles. Plate thicknesses were found to be governed by fatigue. The hull could be built at a number of UK or continental shipyards. The steel hull will be ballasted with inert water allowing the device to be de-ballasted for maintenance. Budget cost estimates within the range of 1.17m pounds to 1.62m pounds per device were obtained. (author)

26058 (ETSU-WV–1693) **Consultancy on review of SEA Clam wave energy device.** Coventry Polytechnic Enterprises Ltd. (United Kingdom). 1992. 59p. Order Number DE93504502. Source: OSTI; NTIS (US Sales Only).

Three principal aspects of the development of the Circular SEA Clam wave energy device by the Energy Systems Group at Coventry Polytechnic are reviewed. Firstly, the mathematical modelling of the overall system performance and availability is reviewed and used to evaluate the likely effects on unit cost of electricity generation of variations in device design, power chain characteristics and operational water depth. The predicted cost is in the range 3.5 to 6.0 p/kWh. Secondly, the development of the flexible membranes is reviewed. The membranes probably constitute the largest risk element of the Clam device. Nevertheless, the results of testing to date, lead to the conclusion that membranes for less demanding wave energy applications can be designed to survive for an economically attractive lifetime. Finally, work world-wide on the Wells turbine is reviewed. Because of its simplicity and linear pressure drop/flow characteristic, it is eminently suited to wave energy applications. Its characteristics are now well understood by the Group. A series of programmes are available to predict, with some confidence, the starting and energy conversion performance of a turbine of particular geometry. Given appropriate attention to the aerodynamic design and to the geometry and surface finish of the rotor blades, at this stage a yearly mean efficiency of over 70% in appropriate wave climates can be expected. (author)

17 WIND ENERGY

1701 Resources and Availability (Climatology)

26059 (ENEA-RTI-INN–92-11) **Doppler velocimeter: Design proposal (part 2).** Barbini, R.; Colao, F.; Giorgi, M.; Stojanovic, V. ENEA, Frascati (Italy). 1992. 20p. (In Italian). (RTI-INN–92-11). Order Number DE93799188. Source: OSTI; NTIS (US Sales Only).

The Doppler velocimeter system proposed in this study is intended for wind velocity measurements with the use of LIDAR (light detection and ranging) technology. The system is based on a low pressure hybrid carbon dioxide laser whose beam is sent into the atmosphere and then reflected back by atmospheric particulates, which, blown by the wind, shift the incident radiation frequency according to the Doppler effect. The LIDAR echo is monitored by a telescope and sent onto a detector contemporaneously receiving continuous wave radiation from a local laser oscillator. The interaction of the two laser beams produces signals, including a signal at the beams' intermediate frequency. By analyzing this signal with conventional radiofrequency techniques, it's possible to derive the instantaneous wind velocity component, range resolved in the direction of the LIDAR beam.

26060 (ETSU-WN–6029-P1) **The impact of climate variability on the UK wind resource. Final report.** Palutikof, J.P. (East Anglia Univ., Norwich (United Kingdom). Climatic Research Unit); Guo, X.; Barthelmie, R.J.; Halliday, J.A.; Hitch, T.J. East Anglia Univ., Norwich (United Kingdom). Climatic Research Unit; Rutherford Appleton Lab., Chilton (United Kingdom). 1993. 150p. Contract E/5A/CON/6029/2208. Order Number DE93506441. Source: OSTI; NTIS (US Sales Only).

This report describes work carried out to assess the impact of climate variability on the U.K. wind resource. The project built on earlier work carried out for the Department of Energy, in which 38 hourly wind speed and direction records were assembled from around the British Isles. With one exception, Lerwick, all these records covered a period of less than 20 years. Records of less than 20 years are inadequate to investigate long-term variability in the wind field, and yet variability on these time scales does exist and has considerable implications for the wind energy industry. The objective of the project was therefore to evaluation the potential scale of long-term temporal variability in the wind resource of the U.K., and to assess the implications for the wind energy industry. Variations in both on-and off-shore resource were examined. A brief study of the possible implications of greenhouse-gas related warming for wind speeds over the British Isles was carried out. (author)

26061 (ETSU-WN–6029-P2) **The impact of climate variability on the UK wind resource. Final report: Appendices.** Palutikof, J.P. (East Anglia Univ., Norwich (United Kingdom). Climatic Research Unit); Guo, X.; Barthelmie, R.J.; Halliday, J.A.; Hitch, T.J. East Anglia Univ., Norwich (United Kingdom). Climatic Research Unit; Rutherford Appleton Lab., Chilton (United Kingdom). 1993. 148p. Contract E/5A/CON/6029/2208. Order Number DE93506440. Source: OSTI; NTIS (US Sales Only).

In Appendix 1, time series charts compare observed monthly mean wind speeds for the 38 stations with the wind speed predicted from the geostrophic wind. Appendix 2 presents time series charts of the reconstructed annual mean wind speeds for the 31 stations from 1881 to 1989. Tables of basic statistics calculated from the 1881-1989 reconstructed wind speed time series of the 31 stations are given in Appendix 3. Basic statistics for ten-year running means calculated from the reconstructed 1881-1989 wind speed time series of the 31 stations, and dates of the maximum and minimum wind speed for the 31 stations are tabulated in Appendices 5 and 6.

26062 (ETDE/JP-mf–93798910) **Prospect on new energies.: Wind power generation.** Institute of Applied Energy, Tokyo (Japan). Mar 1993. 28p. (In Japanese). Order Number DE93798910. Source: OSTI; NTIS; Available from The Institute of

Applied Energy, 14-2, Nishishinbashi 1-chome, Minato-ku, Tokyo, Japan.

This paper reports surveys on wind power generation carried out by the General Energy Engineering Research Institute of Japan. There has been worldwide heightening interest in wind power generation since the outbreak of the oil crises. Fifteen thousand wind power plants are in operation in California, and about 3,000 plants in Denmark are taking care of about 3% of the national power demand. An occurrence of global warming has drawn attention again to this energy, having caused active movements of expansion of its use in Europe. The 1980's has seen improvements in plants each with output from several ten kW to several hundred kW, having resulted in enhanced economic effects. Wind power generation is in the stage of commercialization in well suited topographies. Mitsubishi Heavy Industries of Japan has fabricated wind power generators of 300-kW class output on a trial basis, and sold subsequently 697 generators in the states of California and Hawaii where the machines are exhibiting creditable operation records. The company has received orders for 103 generators from the United Kingdom in 1992. The situation of wind power generation in Japan is such that eight plants are in test operations carried out by the Kyushu, Okinawa and Tohoku electric power companies. Interest is focused on their test results which should help contribute to preserving the earth. 6 refs., 9 figs., 6 tabs.

26063 (ETSU-WN–6027) **Wind farm balance of plant costs.** Craig, L.; Liebmann, C. Wind Energy Group Ltd., Southall (United Kingdom). 1992. 192p. Sponsored by AEA Environment and Energy, Harwell (United Kingdom). Contract E/5A/CON/6027/2216. (WEG–33-6217). Order Number DE93770013. Source: OSTI; NTIS (US Sales Only); INIS.

The study consisted of a detailed investigation of the infrastructure required for the construction and operation of a windfarm in the UK. Costing of the equipment and installation was carried out for three UK sites, with different physical characteristics. A literature survey was carried out to determine current practice in the siting of turbines within windfarms in Europe and the USA. Wind turbines were then laid out on the sites selected for study. Requirements and costs for roads, foundations and site buildings, site electrical system and grid connection, the supervisory control and data acquisition system were discussed and evaluated. A comparison between the balance of plant costs for the 33-metre MS-3 400 kW wind turbine and the 50-metre LS-2 1 MW wind turbine was made for each area of study. Overall balance of plant costs was reviewed, with an investigation of the cost components which are most sensitive to variations. The balance of plant costs averaged over the three sites were 13.0 p/kWh/annum for the MS3 windfarms and 10.6 p/kWh/annum for the LS-2 windfarms. Maps of the sites under investigation, design drawings and tables of costs are included to give supporting information to the text. (author).

26064 (NEI-SE–114) **Operating experiences from small and medium sized wind power plants 1989-1991: Final report.** Svensk Energi Utveckling AB, Stockholm (Sweden); Kraftfoeretagens Vindkraft AB, Stockholm (Sweden). Sep 1992. 48p. (In Swedish). Order Number DE93500836. Source: OSTI; NTIS; INIS; Also available from: Vattenfall AB, Research Vindenergi, attn. Anders Andersson, Box 88, S-620 20 Klintehamn, Sweden.

32 wind power plants, 50-300 kW, are included in this survey of availability, capacity factors, energy production and operational disturbances. Some results: Mean availability has been above 0.95, mean capacity factor 0.2. The investment cost is around 8000 SEK/kW (about 1400 USD/kW). The best installations can be profitable if electricity tax relief is granted. Most disturbances originate in the control systems, the generators and the yaw systems. (13 figs., 10 tabs.).

1705 Environmental Aspects

26065 (ETSU-WN–6056/026) **An investigation of the levels of electromagnetic radiation generated by wind turbines.** Morgan, C.A. Garrad, Hassan and Partners, Bristol (United Kingdom). 1992. 116p. Order Number DE93504801. Source: OSTI; NTIS (US Sales Only); INIS.

The issue of electromagnetic interference is arising with some regularity as various wind energy projects throughout the UK reach the stage where local authority planning approval is sought. To many of the parties involved, wind turbines represent an unknown quantity and hence objections to their siting must be expected. Wind turbines may cause electromagnetic interference through two quite distinct processes. The first occurs when the wind turbine scatters electromagnetic signals passing through the area of the site and essentially, provides a second path between the transmitter and receiver of the signal. The second source of interference arises when signals generated within the wind turbine itself affect communications equipment or, indeed, any electronic circuitry. A case in point is a wind farm project under development by Bonython Estates of Cornwall. The aim of this project was to investigate the emissions from the wind turbines proposed for the Bonython development. This was achieved by means of field measurements on existing installations. 26066 (AUC-IBT-R–9313) **Fatigue tests on laminated wood beams: Partial report 12: Materials testing.** Pilegaard Hansen, L.; Rathkjen, A. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. Apr 1993. 125p. (In Danish). Contract TR-88.1040;Contract ENS-51171-91.0004. Order Number DE93500150. Source: OSTI; NTIS.

Fatigue properties of laminated wood beams were investigated during the period 1987-93 and described in previous reports. The results are presented here of uniaxial stretch and pressure mechanical testing carried out in parts cut out of the beams that had undergone fatigue testing. Photographs of the tested examples are included. (AB).

26067 (AUC-IBT-R–9315) **Fatigue tests on laminated wood beams: Partial report 14. Testing of series L.** Pilegaard Hansen, L.; Rathkjen, A. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. May 1993. 60 p.p. (In Danish). Contract TR-88.1040;Contract ENS-51171-91.004. Order Number DE93500098. Source: OSTI; NTIS.

In the case of these tests for fatigue in the case of laminated wooden beams, which could be used for wind turbine blades, it has been possible to affect the beam on each side of the central axis and to make relocation-controlled and strength- controlled tests. Relevant safeguards, a noise muffling screen and a fire alarm were developed. The results of the testing are presented and the text is illustrated with photographs of the testing in progress. (AB) (15 refs.).

26068 (ETDE-IT–93-178) **Experimental results of wind powered pumping plant with electrical transmission.** Falchetta, M.; Prischich, D.; Benedetti, A.; Cara, G. ENEA, Casaccia (Italy). 1992. 11p. (CONF-9206342–2: Potential for small and medium sized wind energy application in Mediterranean countries, Rodi (Greece), 25-27 Jun 1992). Order Number DE93799198. Source: OSTI; NTIS (US Sales Only); INIS.

A demonstrative application of deep well pumping system employing a wind powered pumping plant with an electric transmission was set-up and tested for two years at the test field of the Casaccia center of ENEA (Italian Agency for Energy, New Technologies and the Environment), near Rome. The tests permitted the evaluation of the practical performance, advantages and drawbacks of a wind pumping plant of this type, in order to permit a design optimization and a proper choice of components and of control strategies for future commercial applications. The main point of investigation was the evaluation of the effectiveness of a control scheme based on a 'permanent link' between electric generator and electric motor, avoiding any electronics and switching components, and leading to a very robust and reliable means of transferring energy to the pump at variable speed, and at low cost.

26069 (ETSU-N–124) **Safety, reliability and condition monitoring of wind turbines: Proceedings.** Smith, G.M. (Nottingham Univ. (United Kingdom)); Clayton, B.R. (eds.). AEA Environment

and Energy, Harwell (United Kingdom). 1992. 85p. (CONF-9209375–: Workshop on safety, reliability and condition monitoring of wind turbines, Nottingham (United Kingdom), 17 Sep 1992). Order Number DE93503574. Source: OSTI; NTIS (US Sales Only).

During recent years the number of wind turbines installed in the UK has grown rapidly. Operators of wind turbines require a reliable performance with minimum outage times in order to ensure commercial viability. Safety and reliability are clearly of paramount importance in achieving these aims and condition monitoring techniques need to be developed in order to ensure continuing structural integrity of the wind turbine and its components. It was with these thoughts in mind that this first BWEA/DTI workshop covering some aspects of the topic was organised. Dutch and Danish experiences were presented in order to widen the discussion. The contributions presented in these proceedings include: availability, reliability and maintainability (ARM) management for wind turbines; Danish rules for wind turbine safety and reliability; reliability and monitoring in wind engineering; development of standards and certification in the UK; condition monitoring for composite turbine blades; thermal inspection of composite structures; lubricant analysis as an indicator of wind turbine health. (author)

26070 (ETSU-N–124, pp. 1-2) **Safety and reliability on wind turbines - the Danish rules.** Winther-Jensen, M. (Risoe National Lab., Roskilde (Denmark). Test Station for Wind Turbines). AEA Environment and Energy, Harwell (United Kingdom). 1992. (CONF-9209375–: Workshop on safety, reliability and condition monitoring of wind turbines, Nottingham (United Kingdom), 17 Sep 1992). In *Safety, reliability and condition monitoring of wind turbines: Proceedings.* 85p. Order Number DE93503574. Source: OSTI; NTIS (US Sales Only).

Since the beginning of the eighties the Test Station for Wind Turbines has approved Danish wind turbines. Aspects such as safety and reliability are of course included in the approvals. Step by step a set of safety rules has been built up in the Danish certification system, becoming more exact with growing experience. The set of rules includes aspects such as safety according to third party (safety philosophy, braking systems, design, installation, quality assurance, O and M etc); labour safety (personal safety, admission possibilities, screening, blocking possibilities etc.); fire prevention; and electric safety. Likewise the reliability of a wind turbine has become a part of the approval procedure. The demand for reliability has risen and materials and components are increasingly chosen with this in mind. In the paper when presented, the progress made with respect to safety and reliability will be described and the present rules will be presented. (author)

In *Safety, reliability and condition monitoring of wind turbines: Proceedings.* 85p. Order Number DE93503574. Source: OSTI; NTIS (US Sales Only).

In this paper, two different projects will be presented. The first entitled 'Probabilistic Safety Assessment for Wind Turbines', described the applicability and feasibility of probabilistic techniques as a method for improving the reliability and safety of wind turbines. Besides a description of the working method, it is illustrated by a case study of the Lagerwey wind turbine LW 15/75. The second project is entitled 'Monitoring In Wind Engineering'. A description will be given of the measurements that are being carried out presently on two wind turbines in the Netherlands. The objective of the measurements is to collect operational data from these turbines. (author)

26072 (ETSU-N–124, pp. 4-1-4-10) **Development of standards and certification relating to the UK.** Elliot, G. (National Wind Turbine Centre (United Kingdom)). AEA Environment and Energy, Harwell (United Kingdom). 1992. (CONF-9209375–: Workshop on safety, reliability and condition monitoring of wind turbines, Nottingham (United Kingdom), 17 Sep 1992). In *Safety, reliability and condition monitoring of wind turbines: Proceedings.* 85p. Order Number DE93503574. Source: OSTI; NTIS (US Sales Only).

Standards that apply specifically to wind turbines do not yet exist in the UK but are in course of preparation. The British Standards Institute (BSI) carries out the government's obligations to ensure that appropriate standards are prepared. In the case of wind turbines however the initiative has been taken at international level by the International Electrotechnical Commission (IEC) and BSI carry out a purely reactive role. The standard "Safety of Wind Turbine Generator Systems", currently under development by the IEC, is outlined. Regulatory aspects are discussed in a UK context and the likely form and scope of UK certification is sketched. (author)

26073 (ETSU-N–124, pp. 5-1-5-10) **Condition monitoring techniques for composite wind turbine blades.** Dutton, A.G. (Rutherford Appleton Lab., Chilton (United Kingdom)); Irving, A.D.; Smith, G.M.; Clayton, B.R. AEA Environment and Energy, Harwell (United Kingdom). 1992. (CONF-9209375–: Workshop on safety, reliability and condition monitoring of wind turbines, Nottingham (United Kingdom), 17 Sep 1992). In *Safety, reliability and condition monitoring of wind turbines: Proceedings.* 85p. Order Number DE93503574. Source: OSTI; NTIS (US Sales Only).

Condition monitoring technologies have a broad range of application from quality assurance procedures during manufacture, through research into blade fatigue in the laboratory, to the inspection of working machines in the field. This paper is primarily concerned with discussing those techniques that might be developed for use on composite wind turbine blades in the field, but many of the methods described can and have been used to monitor manufacturing processes in other industries. By their very nature, the most promising of these techniques can be used to extract a lot of extra information about failure processes during laboratory fatigue tests. Most, if not all, the techniques have been developed for use on metal structures and attempts have been made elsewhere to apply them to composite materials. Methods specifically developed for use in composite structures are still in their infancy. At the present time there is no technique that can be immediately applied to composite wind turbine blades in the field. The principal contenders for development, though, are core acoustic emission, vibration monitoring and infrared thermography. Metal components and structures should be adequately covered by existing technologies and procedures. It is also worth noting that manufacturing processes involving composite materials are typically more subject to variation than those involving metals. (author)

26074 (ETSU-N–124) **Availability, reliability and maintainability (ARM) management for wind turbines.** Cummings, D.K. (Lloyd's Register of Shipping, Croydon (United Kingdom)). AEA Environment and Energy, Harwell (United Kingdom). 1992. (CONF-9209375–: Workshop on safety, reliability and condition monitoring of wind turbines, Nottingham (United Kingdom), 17 Sep 1992). In *Safety, reliability and condition monitoring of wind turbines: Proceedings.* 85p. Order Number DE93503574. Source: OSTI; NTIS (US Sales Only).

The risk associated with low plant availability is an important parameter for both operators and manufacturers of wind turbines to consider amongst other risks which must be successfully managed in their businesses. These pressures place potentially conflicting demands on the industry since the achievement of improved availability inevitably involves increased expenditure early in a project in order to obtain benefits later on. There is a need to balance total through life costs against benefits and to avoid expenditure which does not give compensatory improvements in performance. To help resolve this situation Availability, Reliability and Maintainability (ARM) Management techniques have been developed and used in industry to identify those areas of design and operation where increased effort is necessary to improve availability and to clarify the most effective means of improving it. (author)

26075 (ETSU-N–124) **Thermal inspection of composite structures.** Smith, G.M. (Nottingham Univ. (United Kingdom)); Clayton, B.R.; Dutton, A.G.; Irving, A.D. AEA Environment and Energy, Harwell (United Kingdom). 1992. (CONF-9209375–: Workshop on safety, reliability and condition monitoring of wind turbines, Nottingham (United Kingdom), 17 Sep 1992). In *Safety, reliability*

and condition monitoring of wind turbines: Proceedings. 85p. Order Number DE93503574. Source: OSTI; NTIS (US Sales Only).

Reviews of the established and developing inspection techniques for composites recognise the potential that thermal techniques have for the in-service examination of wind turbine blades. This derives from the non-contacting nature of most thermal methods combined with the physical properties of the glass fibre/polymer composites or wood/epoxy laminates from which the blades are constructed. In this paper thermal inspection techniques are described, and examples are given of their use on composites, mainly in applications other than wind engineering. The family of techniques involving thermal imaging divides into two main groups: one group is based on images produced after the external application of heat to the testpiece; and one group making use of the thermal images which result from the generation of heat within the material itself. From surface temperature variations measured as a function of time and position, stresses and structures at and beneath the surface can be derived. (author)

26076 (ETSU-N–124) **Lubricant analysis as an indicator of wind turbine machinery health.** Stuart, R.A. (Lloyd's Register of Shipping, Croydon (United Kingdom)). AEA Environment and Energy, Harwell (United Kingdom). 1992. (CONF-9209375–: Workshop on safety, reliability and condition monitoring of wind turbines, Nottingham (United Kingdom), 17 Sep 1992). In *Safety, reliability and condition monitoring of wind turbines: Proceedings.* 85p. Order Number DE93503574. Source: OSTI; NTIS (US Sales Only).

With their increased experience of wind energy machinery usage, many wind turbine manufacturers are now able to demonstrate machine availability factors in excess of 95%, for specified levels of operation and maintenance costs. The Lubricant Quality Scan (LQS) services outlined which are specifically designed to reduce unscheduled maintenance and the risk of catastrophic failure, help to ensure that these high machine availability factors are achievable and indeed they also serve to reduce the actual costs of operation and maintenance. LQS involves the analysis of samples of lubricants taken from key parts of the machinery at regular intervals so that wear particles can be detected. (author)

26077 (ETSU-WN–5051) **Modal survey of the 60m LS-1.** Warren, J.G. Wind Energy Group Ltd., Southall (United Kingdom). 1993. 127p. (WEG-MS–60-405). Order Number DE93505292. Source: OSTI; NTIS (US Sales Only).

During construction of the Orkney 60 metre WTG, it was recognized that the confirmation of structural dynamic properties by means of a modal survey would be a valuable aid to design verification. A proposal for such a survey was approved in July 1985. The general objective was to identify as built dynamic characteristics of the rotor and tower. Variations from design could have resulted in significant changes in the dynamic loading and response of the system, and this study was intended to identify any potential problems at the earliest opportunity. (Author)

26078 (ETSU-WN–5090) **Extended fatigue monitoring of the MS-1 WTG rotor.** Warren, J.G. Wind Energy Group Ltd., Southall (United Kingdom). 1992. 111p. Order Number DE93504796. Source: OSTI; NTIS (US Sales Only).

The fatigue monitoring study described in this report was instigated by the Department of Energy in order to supplement the fatigue data previously acquired during an earlier MS1 monitoring programme. The potential for a direct assessment of rotor fatigue life by a simple extrapolation was further reduced because of various MS1 configuration changes which were instigated during the fatigue monitoring programme. Nevertheless, a substantial data base was acquired which allowed rotor fatigue damage rates to be assessed and compared with those identified during the original study. This report includes sections on fatigue analysis procedures, the data available for analysis, and interpretation of the results. The remainder of this summary is arranged under the headings of the individual sections of the report. (author)

26079 (ETSU-WN–5099) **Integrated research programme for vertical axis wind turbine blade aerodynamics under environmental and wind tunnel conditions: Executive summary.** Vertical Axis Wind Turbines Ltd., Henel Hempstead (United Kingdom). 1993. 25p. Order Number DE93504808. Source: OSTI; NTIS (US Sales Only).

At high wind speeds VAWT's operate over a large amplitude of angle of attack with resulting massive separation at both extremes of the angle of attack range. This mechanism provides a passive form of power regulation and is a feature of the VAWT 260 (100kW) and more recent VAWT 850 (500kW) turbines. As a result the present aerodynamic research concentrates on the provision of an improved database of unsteady section characteristics using typical VAWT motions, pressure measurements on the blades of VAWT's and theoretical modelling of unsteady VAWT aerodynamics. This approach will improve the understanding of the two-dimensional unsteady aerodynamic behaviour of vertical axis wind turbines. (author)

26080 (ETSU-WN–5108) **Wind turbine control systems modelling and design. Phase I and II: Main report.** Leithead, W.E.; De La Salle, S.A.; Reardon, D.; Grimble, M.J. Strathclyde Univ., Glasgow (United Kingdom). 1992. 54p. Sponsored by AEA Environment and Energy, Harwell (United Kingdom). Contract E/5A/CON/5108/1851;E/5A/CON/6012/2121;E/5A/CON/5116/193 Order Number DE93797877. Source: OSTI; NTIS (US Sales Only).

The role of active feedback control of wind turbines, primarily by varying the pitch angle of the blades, is investigated. The models required for the control design are identified and the criterion for the assessment of the controller determined. Controllers for a fictitious wind turbine are designed using PI control, classical control and linear quadratic Guassian control. The performance of the controllers are evaluated and assessed by simulation studies. (author)

26081 (ETSU-WN–5127) **Testing of a torque-limiting gearbox on the Ilfracombe MS-2 WTG.** Haines, R.S.; Roughton, E.G.; Bossanyi, E.A. Wind Energy Group Ltd., Southall (United Kingdom). 1993. 130p. (WEG–25-4067-REV1). Order Number DE93504803. Source: OSTI; NTIS (US Sales Only).

A gearbox which permits the input shaft to slip indefinitely relative to the output whenever a set torque is reached is termed a "Torque Limiting Gearbox" (TLG). This report concerns the testing of a Wind Turbine Generator (WTG) of a TLG which also introduces compliance below the set torque. The concept is implemented by introducing a differential stage between the main gearbox and the generator, the torque at the secondary output of the differential being controlled by an hydraulic retarder. The differential pressure at the retarder is limited by a relief valve, with a combination of accumulator and restrictor providing passive compliance at lower pressures. Under conditions where the relief valve operates, retarder speed (and hence rotor speed) is limited by a simple PI controller operating on the rotor pitch. (author)

26082 (ETSU-WN–6023) **The effect of rotor characteristics on loading and fatigue life of a WTG in a wind farm.** Wastling, M.A.; Tindal, A.J. Garrad, Hassan and Partners, Bristol (United Kingdom). 1992. 148p. Order Number DE93504805. Source: OSTI; NTIS (US Sales Only).

A likely consequence of using wind turbines within wind farms is that rotors will experience an increase in dynamic loading associated with operation within wakes. A good understanding of this problem is essential if efficient and economic use is to be made of available wind farm sites. The objective of this analytical project was to combine the current understanding of wind conditions within wind farms, the loading of wind turbine rotors and the behaviour of materials used in their construction to predict how much stronger rotors need to be to survive in wind farms compared with the free stream. The study was based on realistic, but artificial wind turbine rotors. This made it possible to consider a wide range of different machine configurations to help identify the important parameters. (author)

26083 (ETSU-WN–6046) **Fatigue testing of 12M wind turbine blades.** Hancock, M.; Richmond, B. Wind Energy Group Ltd., Southall (United Kingdom). 1993. 41p. Contract E/5A/6046/2376. (WEG-R–37-6201). Order Number DE93505291. Source: OSTI; NTIS (US Sales Only).

The principal objective of this study was to establish the fatigue strength of typical wood/epoxy composite wind turbine blades and

determine representative fatigue lifetimes. Four blades were tested in the Civil Engineering Laboratory at City University. The blades were made in 1986 designed for use on an experimental stall-regulated rotor on the Wind Energy Group's MS2 machine at Ilfracombe. Three of these blades were actually run for a few hundred hours in the test programme. The fourth blade was made at the same time for testing prior to marketing in Europe but this was never done. (Author)

26084 (NEI-DK–1198) **Wind turbines modelling: An introduction to experimental identification.** Tantareaunu, C. Nordvestjysk Folkecenter for Vedvarende Energi, Hurup (Denmark). Jun 1992. 29p. Order Number DE93500176. Source: OSTI; NTIS.

Experimental identification in relation to wind turbines modelling is introduced. Such a model is complex because of the rapid variability of wind parameters and the constructive elasticity of the modern wind turbine. The model is required to simulated specific regimes, it helps in optimizing design and the control equipment. The modern adaptive control concept (on-line modelling), the basic mathematical techniques and how the wind conditions are included in the modelling, are dealt with. The author's software is presented and some results found in relevant literature related to both analytical and experimental models for medium and large wind turbines are given. (AB).

26085 (NEI-DK–1201) **First measurements on DANmark 36 - 525 kW wind turbine.** Vilsboell, N.; Kunwald, P.; Tantareanu, C. Nordvestjysk Folkecenter for Vedvarende Energi, Hurup (Denmark). Dec 1992. 38p. Order Number DE93500174. Source: OSTI; NTIS.

The report should be considered in relation to a previous one entitled 'The Research Measurement System on the DANmark 36 - 525 kW Wind Turbine'.

The report contains the first measurement results on the DANmark 36 - 525 kW wind turbine operating at Hanstholm, Denmark. The power spectral density functions were calculated from the records of the torque and bending movements, the data were sampled at 25 Hz. Tests were taken at stopped rotor, using several methods for mechanical excitation. The eigenfrequences of tower bending, rotor and transmission torsional, blade flapwise and blade chordwise are given in addition to the power and turbulence curves and data time tracks. The influence of the site topography on the performance of the windmill is also dealt with. (AB).

26086 (NEI-DK–1202) **The research measurement system on the DANmark 36 - 525 kW wind turbine.** Kunwald, P.; Tantareanu, C. Nordvestjysk Folkecenter for Vedvarende Energi, Hurup (Denmark). Nov 1992. 100p. Order Number DE93500160. Source: OSTI; NTIS.

The aim was to demonstrate the the industrial feasibility of a Danish manufactured standard wind turbine concept (three-bladed rotor up-wind, with stall regulation) of the DANmark 36 - 525 kW wind turbine. The turbine supplies electricity to the grid. Within 20 days the production was 103 kW. The results of the measurement project aimed to validate and improve the calculation code of the blades and structure. Particular attention was given to stresses on the yaw motors which can cause unreliability at long term operation. Dynamic wind loads and performance in relation to conditions of turbulence were also investigated. The characteristics of the site, the design of the turbine and the measurement system are described in addition to the methods of data acquisition and processing, the software tools and calibration of measurement channels. Samples of recorded signals from the transducers are given. (AB).

26087 (NEI-DK–1203) **Wind prediction in short term: A first step for a better wind turbine control.** Tantareanu, C. Nordvestjysk Folkecenter for Vedvarende Energi, Hurup (Denmark). Oct 1992. 37p. Order Number DE93500171. Source: OSTI; NTIS.

The report presents an experimental identification technique of a time series model using the Box-Jenkins methodology. An application study is made for a real wind speed data series. It is claimed that wind direction and especially speed as inputs in a wind turbine model have only a theoretical meaning. In fact the wind parameters vary in the rotor plane. The distance between the point where the wind is measured and the point of the turbine siting is significant. Another model is needed to make the transfer between the punctual measured wind parameters and the equivalent constant wind parameters in the rotor plane. Thus the wind model, the wind turbine model and the equivalence wind model together form the operation process model which should be used for optimizing wind turbine operation. The paper aims at presenting a case study for a wind speed prediction in short range term (seconds) using a real wind speed data series. At each forecast step the model is adapted to the real system parameters. The same mathematical techniques could be used for longer time periods, such as days. This wind speed prediction could be used for energy prediction in terms of hours for an optimum dispatching in power systems. The presented methodology has wide applications. The case study is described in detail. It is concluded that the model, if considered and calculated on-line using recursive algorithms, improves the performance of wind turbine control. Wind speed prediction is also improved. (AB).

26088 (NREL/TP–441-5611) **Circle diagram approach for self excited induction generators.** Muljadi, E.; Carlin, P.W.; Osgood, R.M. National Renewable Energy Lab., Golden, CO (United States). May 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93010031. Source: OSTI; NTIS; GPO Dep.

When an induction generator is connected to a utility line supply, the voltage and frequency at the terminal output are the same as the voltage and frequency of the utility line supply to which the generator is connected. The reactive power needed by the induction generator is supplied by the utility and the real power is returned to the utility. With a fixed frequency dictated by the utility, the induction machine starts generating above the synchronous speed. The range of speed is also limited by the slip. At a very high slip, the copper losses increases as the current increases. On the other hand, in an isolated operation, the induction generator operates in self-excitation mode. It determines its own voltage and frequency. These two quantities depend on the size of the AC capacitor, the induction machine parameters, the electrical load, and the speed of the generator. The operating speed of the induction generator is extended without generating excessive loss. This paper presents an analytical study by utilizing a circle diagram to illustrate the operation of the induction generator in isolated operation. The steady-state calculations are presented to support the analysis. Possible applications for the system in variable-speed generation are currently under investigation. The output can be directly connected to equipment that is non-sensitive to the frequency (a heater, battery charger, etc.) or can be connected to a converter to get a fixed-frequency AC output.

26089 (NREL/TP–442-4864) **Examination of forced unsteady separated flow fields on a rotating wind turbine blade.** Huyer, S. (Univ. of Colorado, Boulder, CO (US)). National Renewable Energy Lab., Golden, CO (United States). Apr 1993. 247p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93010011. Source: OSTI; NTIS; GPO Dep.

The wind turbine industry faces many problems regarding the construction of efficient and predictable wind turbine machines. Steady state, two-dimensional wind tunnel data are generally used to predict aerodynamic loads on wind turbine blades. Preliminary experimental evidence indicates that some of the underlying fluid dynamic phenomena could be attributed to dynamic stall, or more specifically to generation of forced unsteady separated flow fields. A collaborative research effort between the University of Colorado and the National Renewable Energy Laboratory was conducted to systematically categorize the local and global effects of three- dimensional forced unsteady flow fields.

26090 (VF-UD–92-49) **Development study of a large wind turbine system, Third generation: Final report phase 1 - general conditions.** Svensson, Paer. Vattenfall AB, Vaellingby (Sweden). Dec 1992. 59 p.p. (In Swedish). Order Number DE93500928. Source: OSTI; NTIS.

The aim for the complete Development study III is to reach a design for the third generation of large wind turbines which can prove to produce electricity at a competitive cost. This report presents the results from phase 1, in which the conditions for the whole study are established. The main items during phase 1 are to define loads and technical requirements together with the economical conditions

for large wind turbines. A wind and load description which is based on the present work on standards for wind energy converters within IEC has been developed. Together with the technical specification it forms the fundamentals for the future work. The new wind description results in substantially decreased loads for the Naesudden II design (35% at some components) and further load reductions may be reached through modifications of the design. The allowed cost for future commercial development of power production plants in Sweden will be low during the next ten years. In the year 2000 an allowed cost of 0.26 SEK/kWh in today's price level is expected. However, a decision about carbon dioxide taxes will increase the interest in wind energy in Europe and maybe in Sweden. The target cost for the unit in Development Study III is 3.00 SEK/kWh/year, which is based on actual costs of small wind turbines. This means a cost which is only one third of the cost for a new Naesudden II unit. (12 refs., 5 figs, 4 tabs.).

26091 (ANL–92/2-Vol.2) **COMMIX-PPC: A three-dimensional transient multicomponent computer program for analyzing performance of power plant condensers: Volume 2, User's guide and manual.** Chien, T.H.; Domanus, H.M.; Sha, W.T. Argonne National Lab., IL (United States). Feb 1993. 217p. Sponsored by Taiwan Power Co., Taipei (Taiwan, Province of China). DOE Contract W-31109-ENG-38. Order Number DE93012309. Source: OSTI; NTIS; GPO Dep.

The COMMIX-PPC computer program is an extended and improved version of earlier COMMIX codes and is specifically designed for evaluating the thermal performance of power plant condensers. The COMMIX codes are general-purpose computer programs for the analysis of fluid flow and heat transfer in complex industrial systems. In COMMIX-PPC, two major features have been added to previously published COMMIX codes. One feature is the incorporation of one-dimensional conservation of mass. momentum, and energy equations on the tube side, and the proper accounting for the thermal interaction between shell and tube side through the porous medium approach. The other added feature is the extension of the three-dimensional conservation equations for shell-side flow to treat the flow of a multicomponent medium. COMMIX-PPC is designed to perform steady-state and transient three-dimensional analysis of fluid flow with heat transfer in a power plant condenser. However, the code is designed in a generalized fashion so that, with some modification. it can be used to analyze processes in any heat exchanger or other single-phase engineering applications.

26092 (CONF-930401–18) **An optical technique for characterizing the liquid phase of steam at the exhaust of an LP turbine.** Kercel, S.W. (Oak Ridge National Lab., TN (US)); Simpson, M.L.; Azar, M.; Young, M. Oak Ridge National Lab., TN (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Meeting on nuclear plant instrumentation, control and man-machine interface technologies; Oak Ridge, TN (United States); 18-21 Apr 1993. Order Number DE93015326. Source: OSTI; NTIS; INIS; GPO Dep.

Optical observation of velocity and size of water droplets in powerplant steam has several applications. These include the determination of steam wetness fraction, mass flow rate, and predicting erosion of turbine blades and pipe elbows. The major advantages of optical techniques are that they do not interfere with the flow or perturb the observation. This paper describes the measurement of the size and velocity of particles based on the observation and analysis of visibility patterns created by backscattered circularly polarized light. The size of latex particles in a dry nitrogen stream was measured in the laboratory. Visibility patterns of water droplets were observed in the low pressure turbine of Unit 6 of Alabama Power's Gorgas Steam Plant.

26093 (DOE/METC–92/6128-Vol.1, pp. 9-16) **Combustion Engineering IGCC repowering project.** Thibeault, P.R. (Combustion Engineering, Inc., Windsor, CT (US)); Gibson, C.R. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The objective of this project is to demonstrate the Combustion Engineering, Inc. (C-E) advanced integrated coal gasification combined cycle system (IGCC) which is capable of providing high performance, cost competitive, environmentally compliant electric power. The integrated performance to be demonstrated will include all major subsystems in the IGCC system including coal feeding, C-E's advanced air-blown coal gasification, advanced methods of coal cleanup, a conventional combustion turbine adapted to use low-Btu coal gas as fuel, and the integration of the combustion turbine with a steam turbine to provide a combined cycle.

26094 (DOE/METC–92/6128-Vol.1, pp. 17-24) **Tampa Electric Company integrated gasification combined cycle project.** USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The primary objective of this Cooperative Agreement is to conduct a cost shared project that will demonstrate oxygen-blown entrained-flow Integrated Gasification Combined Cycle (IGCC) technology. The parties anticipate that, if the demonstration project is successful, the oxygen-blown entrained-flow IGCC technology could become commercialized during the 1990's and will be capable of (1) achieving significant reductions in the emissions of sulfur dioxide and the oxides of nitrogen from existing facilities to minimize environmental impacts such as transboundary and interstate pollution, and (2) providing for future energy needs in an environmentally acceptable manner.

26095 (DOE/METC–92/6128-Vol.1, pp. 25-33) **Pinon Pine IGCC project status update, August 1992.** Motter, J.W. (Sierra Pacific Power Company, Reno, NV (US)); Pitcher, J.D.; Fankhanel, M.; Campbell, W. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

Since the recent (August, 1992) execution of the Cooperative Agreement, the major focus of work has been on critical-path environmental permitting activities, both related to the NEPA process as well as state and local activities. Pending approval of the project by the Nevada Public Service Commission, detailed engineering activities will commence in November. Federal funding of the project automatically invokes environmental review under the National Environmental Policy Act (NEPA). This project will require an Environmental Impact Statement, or EIS, with DOE as the lead agency for the NEPA reviews. The project must also be approved by the Nevada Public Service Commission (PSCN) in the state's Resource Planning process. To date, milestones that have been met include publication of the Notice of Intent in June, Public Scoping Meetings in July of 1992, and the submission of SPPCo.'s Resource Plan to the PSCN, with the project included as part of the Recommended Resource Plan. SPPCo. has also completed an Environmental Information Volume for the project.

26096 (DOE/METC–92/6128-Vol.1, pp. 34-41) **Wabash River Coal Gasification Repowering Project.** Amick, P. (Destec Energy, Inc., Houston, TX (US)); Fisackerly, R.; Spears, R.C.; Cook, J.J. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification

and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The Project's sponsors, PSI Energy, Inc. and Destec Energy, Inc., will demonstrate, in a fully commercial setting, coal gasification repowering of an existing generating unit affected by the Clean Air Act Amendments ("CAAA"). The Project will also demonstrate important advancements in Destec's coal gasification process for high sulfur bituminous coal. Upon completion, the Project will not only represent the largest CGCC power plant in operation in the United States but will also emit lower emissions than any other high sulfur coal fired power plant.

26097 (DOE/METC–92/6128-Vol.1, pp. 53-63) **Hot gas cleanup test facility for gasification and pressurized combustion.** USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

Southern Company Services, Inc. (SCS) has entered into an agreement with the Department of Energy, Morgantown Energy Technology Center (DOE/METC) to design, construct and operate the Hot Gas Cleanup Test Facility for Gasification and Pressurized Combustion. The purpose is to identify and evaluate potential hot particulate cleanup systems on a scale large enough so that these system can be related to potential commercial system. This entails first developing the criteria for engineering scale testing of hot particulate control devices which will lead to the design, construction and operation of a flexible test facility capable of operating under gasification and PFBC conditions.

26098 (DOE/METC–92/6128-Vol.1, pp. 77-83) **Gasifiers optimized for fuel cell systems.** Fruchtman, J. (Energy Research Corp., Danbury, CT (US)); Steinfeld, G.; Hauserman, W.B.; Lee, A.; Meyers, S.J. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. DOE Contract AC21-90MC27227. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The overall objective of this effort is to identify coal gasification systems that significantly improve the performance, economics and efficiency of electric power generation systems in which coal gasification is integrated with carbonate fuel cells. This objective is to be accomplished by design studies of conceptual integrated coal gasification/fuel cell systems comprised of coal gasification, gas cleanup, fuel cells, and ancillary components required for a complete coal based power plant system. The integrated systems will not produce tars, char, fuel gases or steam as by-products.

26099 (DOE/METC–92/6128-Vol.1, pp. 84-94) **Integrated operation of a pressurized fixed bed gasifier and hot gas desulfurization system.** Gal, E. (GE Environmental Services, Inc., Lebanon, PA (US)); Furman, A.H.; Ayala, R. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The primary objective of this contract continues to be the demonstration of high temperature fuel gas desulfurization and particulate removal using a moving bed process with a regenerable metal oxide sorbent. The fuel gas source for test operation is a fixed bed, air blown gasifier located at GE Corporate Research and Development in Schenectady, New York. The demonstration project also includes the design, construction, installation and test operation of a gasoline simulator which includes a modified GE MS6000 type gas turbine combustor and a film cooled, first stage LM 6000 nozzle assembly. The hot gas cleanup (HGCU) system and the gas turbine simulator have been designed to operate with the full 8000 lb/hr fuel gas flow from the gasification of 1800 lb/hr of coal at 280 psig and 1000 to 1150 F. An advanced formulation of zinc ferrite as well as zinc titanate have been used as the regenerable metal oxide sorbents in testing to date. Demonstration of halogen removal as well as characterization of alkali and heavy metal concentrations in the fuel gas remain objectives, as well.

26100 (DOE/METC–92/6128-Vol.1, pp. 119-126) **Mild gasification in transport reactors.** Bates, S.C. (Advanced Fuel Research, Inc., East Hartford, CT (US)); Zhao, Yuxin. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. DOE Contract FG05-90ER80877. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The objective of this Phase II SBIR research program is to develop an integrated process for coal conversion in a combined gas turbine/stream turbine to produce: Liquids for use as a peaking fuel or as a feedstock for upgrading to transportation fuel and/or chemicals. Electricity generated at high efficiency (> 42%) and low cost ($1000/kw).

26101 (DOE/METC–92/6128-Vol.1, pp. 127-133) **Evaluation of options for CO_2 capture/utilization/disposal.** Livengood, C.D. (Argonne National Laboratory, IL (US)); Doctor, R.D. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The primary objective of this project is to develop in-depth engineering evaluations of technologies for the capture, use, and disposal of carbon dioxide (CO_2). This project emphasizes CO_2-capture technologies combined with integrated gasification combined-cycle (IGCC) power systems. Complementary evaluations will address CO_2 transportation, CO_2 use, and options for the long-term sequestration of unused CO_2. Commercially available CO_2-capture technology will provide performance and economic baselines for comparing innovative technologies. These results will then support recommendations for research and development to improve CO_2 capture and use, new process concepts, and optimized energy balances for CO_2 mitigation. Limited experimental research will provide data for evaluating new concepts.

26102 (DOE/METC–92/6128-Vol.1, pp. 154-164) **Thermal conductivity of coal ashes and slags.** Nowok, J.W. (Univ. of North Dakota, Grand Forks (US)); Steadman, E.N. USDOE Morgantown Energy Technology Center, WV (United States). Sep 1992. (CONF-920951–Vol.1: 12. annual gasification and gas stream cleanup systems contractors review meeting, Morgantown, WV (United States), 15-17 Sep 1992). In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The purpose of this work is twofold: (1) to gain an understanding of the effects of mineralogical inhomogeneity and porosity of coal ash deposits on the heat-transfer phenomena, and (2) to determine the relationship between thermal and electrical conductivities in the temperature range of 25°-500°C. This new program was initiated at the Energy and Environmental Research Center (EERC) in 1991 to elucidate the cause of significant heat-transfer problems in the convective pass of utility boilers.

26103 (LUTMDN-TMVK–7010) **Evaporative gas turbine cycles: A thermodynamic evaluation of their potential.** Rosen, P.M. Lund Univ. (Sweden). Dept. of Heat and Power Engineering. Mar 1993. 59p. Order Number DE93500698. Source: OSTI; NTIS.

The report presents a systematic method of thermodynamically evaluating different gas turbine cycles, treating the working fluids as

ideal gases ($c_p=c_p(T)$). All models used to simulate different components in the cycles are presented in the report in detail and then connected in a computer program fully developed by the author. The report focuses on the theme of evaporative gas turbine cycles, in which low level heat is used to evaporate water into the compressed air stream between the compressor and recuperator. This leads to efficiency levels close to a comparable combined cycle but without the steam bottoming cycle. A parametric analysis has been conducted with the aim of deciding the best configuration of an evaporative cycle both for an uncooled expander and for a cooled expander. The model proposed to simulate the cooled expander is a combination between two existing models. (121 refs., 35 figs.,).

26104 (NEI-DK–1195) **District heating master plan study and assessment. Szazhalombatta: Final report.** Danish Energy Consultants, Glostrup (Denmark). May 1993. 119p. Contract ENS-2124/93-0001. Order Number DE93500111. Source: OSTI; NTIS.

The report deals with the district heating system in Szazhalombatta in Hungary, the steam transmission pipes to an oil refinery and the latter's energy consumption. The two heat consumers (the district heating system and the refinery) buy heat in the form of hot water and steam from the power plant. The largest consumer is the oil refinery with approximately 90% of the total annual heat production from the power plant. 5% of the power production is used by the power plant itself, which is explained by the cold winters and the fact that it is an open air plant. The total heat capacity demand is expected to be 512 MJ/s in 2012. If energy savings (primarily a steam condensate return system) are introduced, heat capacity demand will fall by 43 MJ/s and energy demand will decrease by 680 Tj in 2012. In this feasibility analysis the situation with regard to these plants is described in detail with reference to market, financial and technical aspects and principles of design for heat production systems. Comprehensive recommendations are given by the Danish consultant company for initiating energy savings in a society facing vast economical and organizational changes as a result of transformation to a market economy. (AB).

In *Proceedings of the twelfth annual gasification and gas stream cleanup systems contractors review meeting: Volume 1.* 325p. Order Number DE93000228. Source: OSTI; NTIS.

The Calderon process integrates the production of a rich fuel gas for methanol conversion and a lean fuel gas for electric power generation. The feeds to this process include run-of-mine coal, air, water and make up lime sorbent, while the major products are methanol and electricity. Slag and elemental sulfur are by-products. The test program is intended to demonstrate the integrated operation of the separate components of the Calderon gasification/hot gas cleanup process, and to duplicate conditions that would occur in a commercial application of the process. In this way its operation is to provide necessary design data and demonstration of process and equipment including materials of construction.

26108 (ETDE/JP-mf–93798681, pp. 42-45) **Simultaneous desulfurization-denitrification technology using electron beams.** Aoki, S. (Ebara Corp., Tokyo (Japan)). 20 Jan 1993. 94p. (In Japanese). In *Symposium on global environmental conservation and air pollution prevention technology.* Order Number DE93798681. Source: OSTI; NTIS (US Sales Only).

This paper summarizes an electron beam method capable of removing sulfur and nitrogen in a dry method as a new technology, its desulfurizing and denitrifying performances, and the pilot test under way (gas treatment amount of 12000 Nm^3/h). The method irradiates electron beams onto stack gas under coexistence of ammonia gas. The irradiation generates chemically active species with which sulfur and nitrogen oxides react to turn into sulfuric acid and nitric acid, and further convert into aerosols of ammonium sulfate and ammonium nitrate. The aerosols are removed by electric dust collectors or bag filters. The method features that it produces no waste water, can remove SOx and NOx simultaneously at high efficiency, requires simple facility with easy operation and no expensive catalysts, and can utilize the by-products as fertilizers. It was learned from basic experiments that the lower the temperature, the higher desulfurization rate can be achieved, and a multi-stage irradiation improves the denitrification efficiency. The pilot test is being carried out with a schedule having started in November 1992 to last for one year. 3 figs.

26109 (OCDO–93013792) **Catalytic reduction of SO_x-NO_x in coal flue gas: Phase 1 report.** Ohio Coal Development Office, Columbus, OH (United States). 20 Apr 1988. 160p. Sponsored by Ohio State Government, Columbus, OH (United States). Grant CDO/D-86-18. Source: OSTI; Ohio Coal Development Office, 77S. High Street, P.O. Box 1001, Columbus, OH 43266-0001.

Engineering drawings for this project are identified as CAPE–3056. Inquiries may be directed to: Office of Scientific and Technical Information P.O. Box 62, Oak Ridge, TN 37831.

The overall project objective is to provide industry with technology and equipment to assure cost-effective reduction of So_2 and NO_x emissions to encourage increased use of Ohio coal. A prime preference is to remove both SO_2 and NO_x in a single process step, while generating a revenue-producing and readily marketable byproduct. This project addresses both the definition of preferred technology and pilot scale facilities to demonstrate the process performance while removing SO_2 and NO_x from flue gas produced by burning Ohio coal. The specific project objective is to advance development of the Parsons process by determining if a catalytic hydrogenator can effectively function with flue gas from a coal

boiler. Specific project goals include: (1) 90% SO_2 control, minimum, (2) 90% NO_x control, minimum. (3) Competitive and viable levelized costs. The Parsons process consists of three key process units, each of which has been proven in commercial application. (1) A Beavon Sulfur Recovery (BSR) hydrogenation unit to simultaneously reduce the SO_2 to hydrogen sulfide (H_2S) and the NO_x to elemental nitrogen (N_2). (2) A FLEXSORB SE® PLUS process to recover H_2S from the BSR effluent; its product is the feed stream to the sulfur production ratio. (3) A Recycle Selectox Process unit to convert the H_2S to elemental sulfur. Each of the above process steps has been awarded patents.

26110 (OCDO–93013793) **Catalytic reduction of SO_x-NO_x in coal flue gas: Supplement to the final report.** Ohio Coal Development Office, Columbus, OH (United States); Columbia Gas System Service Corp., Columbus, OH (United States). Research Dept.; Parsons (Ralph M.) Co., Pasadena, CA (United States); Delaware Univ., Newark, DE (United States). Center for Catalytic Science and Technology. Nov 1991. 180p. Sponsored by Ohio State Government, Columbus, OH (United States). Source: OSTI; Ohio Coal Development Office, 77 S. High Street, P.O. Box 1001, Columbus, OH 43266-001 (United States).

Almost half of the coal purchased by the utilities that year was not Ohio coal. The 20-plus million tons/year of non-Ohio coal consumed by Ohio generators is an indication of the order of magnitude of the potential market incentive for Ohio to supply its power plants from its indigenous coal mine. The major reason for the drop in Ohio coal production rate is that the average content of Ohio coal is 3.5 weight percent, with a range of one to six percent. Use of high-sulfur coal introduces environmental problems due to the high SO_2 emission rate in the boiler flue gas. Potential solutions include use of alternative low-sulfur non-Ohio coal and addition of SO_2 (and NO_x) removal facilities. The substitution of non-Ohio low-sulfur coal for Ohio coal is a strong negative for the state and its coal mining industry; it means further shrinkage of the state's coal industry accompanied by loss of Ohio jobs. The Parsons FGC process is a candidate for the alternative solution, i.e., to provide high efficiency post-combustion removal of SO_2 (and NO_x). The Phase 2 pilot plant test results have demonstrated that the Parsons FGC process is capable to remove 99-plus percent of SO_2 and 95-plus percent of NO_x from coal-fired boiler flue gas. The Parsons FGC process will permit Ohio coal fired power plants to burn high-sulfur Ohio coal and achieve conformance with provisions of the Clean Air Act Amendments of 1990. Because SO_2 reduction using the Parsons FGC process will be greater than the amendment requirement, its use will provide the affected Ohio power plant with marketable net allowances having a definite economic value.

26111 (ANL/EAIS–5) **Impact on the steam electric power industry of deleting Section 316(a) of the Clean Water Act: Energy and environmental impacts.** Veil, J.A.; VanKuiken, J.C.; Folga, S.; Gillette, J.L. Argonne National Lab., IL (United States). Environmental Assessment and Information Sciences Div. Jan 1993. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93011232. Source: OSTI; NTIS; INIS; GPO Dep.

Many power plants discharge large volumes of cooling water. In some cases, the temperature of the discharge exceeds state thermal requirements. Section 316(a) of the Clean Water Act (CWA) allows a thermal discharger to demonstrate that less stringent thermal effluent limitations would still protect aquatic life. About 32% of the total steam electric generating capacity in the United States operates under Section 316(a) variances. In 1991, the US Senate proposed legislation that would delete Section 316(a) from the CWA. This study, presented in two companion reports, examines how this legislation would affect the steam electric power industry. This report quantitatively and qualitatively evaluates the energy and environmental impacts of deleting the variance. No evidence exists that Section 316(a) variances have caused any widespread environmental problems. Conversion from once-through cooling to cooling towers would result in a loss of plant output of 14.7-23.7 billion kilowatt-hours. The cost to make up the lost energy is estimated at $12.8-$23.7 billion (in 1992 dollars). Conversion to cooling towers would increase emission of pollutants to the atmosphere and water loss through evaporation. The second report describes alternatives available to plants that currently operate under the variance and estimates the national cost of implementing such alternatives. Little justification has been found for removing the 316(a) variance from the CWA.

Argonne National Lab., IL (United States). Environmental Assessment and Information Sciences Div. [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930647–2: 86. annual meeting and exhibition of the Air and Waste Management Association, Denver, CO (United States), 13-18 Jun 1993). Order Number DE93012852. Source: OSTI; NTIS; INIS GPO Dep.

In order to reduce the pollutant load to the atmosphere and subsequent damaging effects, Titles I and IV of the Clean Air Act Amendments of 1990 (CAAAs) require reductions in emissions of sulfur dioxide (SO_2), nitrogen oxides (NO_x), and volatile organic compounds (VOCs). Title IV is aimed at reducing acidic deposition and requires utilities to reduce SO_2 and NO_x emissions to specified levels. As a consequence of this, many utilities will have to install SO_2 and NO_x control technologies. Title I is concerned with bringing regions into compliance with the National Ambient Air Quality Standards (NAAQS) for the criteria pollutants, among which is ozone (O_3). The NAAQS for O_3 is 120 ppb (parts per billion by volume) hourly average concentration, not to be exceeded four times in three years. O_3 is a secondary pollutant formed in the atmosphere when NO_x and VOCs react together in the presence of sunlight. Utilities are a significant source of NO_x and an unimportant source of VOCs. In the past, O_3 control strategy has focused on reducing VOC emissions because of the possibility that reducing NO_x actually might make O_3 concentrations higher. However, this approach has not worked, perhaps because of underestimation of natural and manmade VOC emissions and transport of O_3 from other regions. Computer modeling has shown that for many highly polluted areas massive NO_x reductions may be necessary in addition to or in place of VOC controls. Utilities are a potential source of these NO_x reductions.

26113 (ETDE-GB–480) **Report and accounts 1992.** Powergen plc, London (United Kingdom). 1992. 24p. Order Number DE93502647. Source: OSTI; NTIS (US Sales Only); INIS; Available from PowerGen plc, 53 New Bond St., London EC2M 1JJ.

The directors present their report and the audited accounts of PowerGen plc for the financial year ended 29 March 1992. The Company's principal activity is the generation and sale of electricity in England and Wales. The Chairman's Statement and Chief Executive's Review, contained in the Annual Review, report on the development of the business during the financial year and the outlook for the future. They contain information about the Company's research and development activities, its commitment to ensuring that environmental implications for the business are properly identified, assessed and managed, and its arrangements with regard to health and safety and employees' welfare at work. Profit before taxation for the financial year to 29 March 1992 was Pound 359 million (an increase on the restated figure for 1990/91) of Pound 87 million or 32 per cent. After providing for taxation (Pound 117 million), and for payment of the dividend (Pound 72 million), the retained profit for the year amounted to Pound 170 million. (Author)

26114 (RVF–92-11) **Need for an investment subsidy for waste cogeneration plants.** Maardsjoe, O. (Ecoheat AB (Sweden)). Svenska Renhallningsverks-Foereningen, Stockhom (Sweden). Dec 1992. 40p. (In Swedish). Order Number DE93500659. Source: OSTI; NTIS; INIS.

Building of new waste-fueled CHPs has been economically evaluated. Total investment cost have been calculated for plants of three different sizes, 2x15, 2x25, and 2x50 MW thermal power, respectively. The calculations show that the small plants have poor and the large plants mediocre profitability. Better economy can be achieved for the large plants if a higher steam quality than normal is used (120 bar, 540 degree C instead of 40 bar, 400 degree C). The conclusions are that investment subsidies are necessary for building these plants, in particular the small ones. Subsidy levels are estimated according to two principles: Pay-back no later than eight years after commissioning, or covering of deficits until revenues surpasses capital costs. Use of biofuels to level the fluctuations in waste flow, and thus make more efficient use of the plant, can also help the economy of the plant. (8 figs., 15 tabs.).

Source: OSTI; NTIS (US Sales Only); INIS.

The development of new techniques, especially in the field of Artificial Intelligence, makes it possible to design more powerful computerised systems supporting tasks related to the design and operation of nuclear power plants. The potential contribution and perspectives for the integration of such systems depend upon whether the improvement of existing plants, the design of next generation reactors or future projects are concerned. This paper will present four systems which show the state of the art in the field of knowledge-based systems. The first one is related to the automatic generation of accidental procedures dealing with the loss of electrical power supply. The second one aims at assisting the power plant utility in following the technical specifications during maintenance operations. Finally, the last two are designed to help an emergency team to evaluate and to forecast the evaluation of an accidental situation in a nuclear reactor plant. Perspectives for one-line operator assistance are then discussed, as well as the main technical topics which will make possible the design of such systems. We conclude with the difficulties which are encountered upon integration of these tools: their validation and the task sharing between man and machine. (author). 8 refs.

Neural networks (NN) techniques have been applied in recent years to many systems by researchers in the nuclear power industry, mainly for modeling and sensor validation. Recent results are reviewed, including new directions in applications to control systems, safety analysis, and "virtual" instruments. As new fast learning algorithms become available, large systems may be learned effectively, even with few training examples. The nuclear industry hesitates to include NN in safety related systems, but it seems that the obstacles could be overcome with the demonstration of successful applications, even from other industries. Coupling of full-scale reactor simulators, as fault database generators, with neural networks learning should be explored. The integration of Expert System technology with NN should improve the Validation and Verification tasks, and also help overcome psychological barriers. It may prove that the potential of NN to help operators, compared with the existing and proposed alternatives, outweigh the risks. (author). 58 refs, 2 figs.

An investigation was made of the potential for thermal-hydraulic instabilities coupled to neutronic feedback in a BWR due to a two recirculation pump trip event using the RAMONA-4B computer code with 3D neutron kinetics. It is concluded that a high-power (100%) and low-flow (75%) initial condition would most likely lead to in-phase density wave oscillations after the tripping of both recirculation pumps, and that RAMONA-4B is capable of predicting such thermal-hydraulic instabilities coupled to neutronic feedback in BWR and in SBWR.

26118 (DTH-AEF-NT–3) **The two-phase friction multiplier factor R and the slip ratio S: A comparison of various correlations.** Oelgaard, P.L. Technical Univ. of Denmark, Lyngby (Denmark). Dept. of Electrophysics. Feb 1993. [30p.] Order Number DE93628296. Source: OSTI; NTIS; INIS.

In this report the theoretical basis for the Lottes-Flinn correlation for the two-phase friction multiplier R is investigated and a less approximative formula for R is derived. The values obtained for R (as a function of pressure and exit void fraction) from these formulas by use of various slip ratio correlations are compared with the R-values obtained by the experimental Martinelli-Nelson and other correlations. It is concluded that while some slip ratio correlations appear to be of rather dubious value, it is not possible from the present comparison to select a best slip ratio correlation or a best two-phase friction multiplier correlation to be used in the computation of boiling water reactors. (au).

(Societe Franco-Americaine de Constructions Atomiques (FRAMATOME), 92 - Courbevoie (France)); Janberg, K.; Geiser, H. Commission of the European Communities, Luxembourg (Luxembourg). 1993. [193p.] Contract FI1W/0130-C. Source: OSTI; NTIS (US Sales Only); INIS.

This report deals with the description of a management route for PWR waste relying to a certain extent on German practices in this particular area. This description, which aims at providing input data for subsequent cost evaluation, includes all management steps which are usually implemented for solid, liquid and gaseous wastes from their production up to the interim storage of the final waste products. This study is part of an overall theoretical exercise aimed at evaluating a selection of management routes for PWR and BWR wastes based on economical and radiological criteria.

26120 (IAEA-TECDOC–697, pp. 75-81) **The effect of fuel pellet variants on fission gas release following power ramps.**

Howl, D.A. (British Nuclear Fuels Ltd., Springfields (United Kingdom)); Topliss, I.R. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

Results are presented of fission gas release inferred from on-line rod internal pressure measurements for several fuel variants which were subjected to a power ramp after irradiation to 18 MWd/kgU. The variants were standard and large grain solid fuel, and niobia-doped and undoped large grain annular fuel. The rates of fission product release, which did not saturate in 20-70 days following power ramps to 38-45 kW/m, are well predicted by the ENIGMA fuel performance code. The experiments also included on-line measurements of rod diameter, enabling the evolution and relaxation of ridging to be determined. Examples are given in the paper. These experiments were jointly funded by British Nuclear Fuels plc and the Electric Power Research Institute. (author). 2 refs, 15 figs, 1 tab.

26121 (IAEA-TECDOC–697, pp. 103-110) **Impact of systematic stoichiometry differences among BWR rods on fission gas release.** Grapengiesser, B. (ABB Atom AB, Vaesteraas (Sweden)); Schrire, D. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper an approach for the explanation of high fission gas release (FGR) found in rods towards the control rod corner of the assembly is suggested, implying that differences in initial enrichment by a sequence of physical phenomena have a strong impact on gas diffusion constant and FGR. 8 refs, 14 figs.

26122 (IAEA-TECDOC–697, pp. 111-118) **Rim effect observations from the Third Riso Fission Gas Project.** Kjaer-Pedersen, N. (S. Levy Inc., Campbell, CA (United States)). International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

The Third Riso Fission Gas Release Project was completed early 1991. The project was sponsored by a group of participants representing the world-wide nuclear industrial and scientific community. The analysis presented in this paper is based on an original data analysis sponsored by the Swedish Nuclear Inspectorate. This data analysis aimed at interpreting the temperature and fission gas release measurements of the project. 9 refs.

26123 (STUK-B-YTO–101) **Operation of Finnish nuclear power plants: Quarterly report 2nd quarter, 1992.** Tossavainen, K. (ed.). Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). Dec 1992. [28p.] Order Number DE93629703. Source: OSTI; NTIS; INIS.

Published also in Finnish as report number STUK-B-YTO–100.

The Finnish nuclear power plant units Loviisa 1 and 2 as well TVO I and II were in operation for almost the whole second quarter of 1992. Longer breaks in production were caused by the annual maintenance of the TVO plant units. The load factor was 87.4 %. At TVO I it was detected during the annual maintenance outage when removing nuclear fuel assemblies from the reactor that one assembly had been loaded into the reactor in an incorrect manner during the previous year's annual maintenance: the assembly was slightly higher than the other assemblies. The water cooling the nuclear fuel partly by-passed the fuel assembly and the coolant flow proper passing through the assembly was below design. The fuel assembly's cooling had been sufficient during the whole operating cycle but could have essentially deteriorated during certain transients with the danger of consequent damage to some fuel rods. On the International Nuclear Event Scale the event is classified as level 1. Other events in this quarter which are classified on the International Nuclear Event Scale were level 0/below scale on the scale.

26124 (VTT-TIED–1411) **Simulation of fires based on flow calculation.** Huhtanen, R. (Technical Research Centre of Finland, Espoo (Finland). Nuclear Engineering Lab.); Jacobson, T. Technical Research Centre of Finland, Espoo (Finland). 1992. [50p.] (In Finnish). Order Number DE93629704. Source: OSTI; NTIS; INIS.

The fire simulation based on flow calculation is described in the publication, and the calculated result is compared with the results obtained from fire tests. The tests have been made in Germany in a nuclear power plant removed from service. The simulation describes the flow field of the entire building, the main features of the construction effecting on it and the edge conditions. The fire is described as a given source, the value of which varies as a function of time. Heat transfer into the constructions is described using a separate heat transfer program. The result obtained from calculation describes the flow and temperature fields formed in a fire generally correctly. Due to the used sparse calculation network the results contain locally large deviations. The discrete-transfer radiation calculation method used for calculation of burning and heat transfer, and testing of it are described in the appendix. The method describes the heat radiation propagating diagonally to the calculation network better than the six-flux method used before.

Source: OSTI; NTIS (US Sales Only); INIS.

Cooperation between two CEA research laboratories has served to combine nondestructive testing with destructive analyses on problems set within the framework of the Safety analysis. Network microcracking in roll expansion and cracking under support plates of alloy 600 tubes were accordingly investigated, by combining original methods of defect production in laboratory with fine destructive and nondestructive analysis.

26126 (CEA-DES–110) **International technical assistance example. Consortium action in Bulgaria.** Mattei, J.M. (CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire); Milhem, J.L.; Heuser, F.W.; Kelm, P. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Dept. d'Evaluation de Surete. Mar 1993. [11p.] (In French). (CONF-921282–: Conference on WWERs reactor safety, Paris (France), 9 Dec 1992). Order Number DE93631497. Source: OSTI; NTIS (US Sales Only); INIS.

The safety status achieved last year at the Kozloduy Nuclear Power Plant (NPP) and the capability of the Bulgarian Nuclear Safety Authority (BNSA) to assess the safety of the plant and the adequacy of proposed improvements have been matters of international concern. However, the Kozloduy NPP contributes 35-40 per cent of the electrical generating capacity in Bulgaria. For further operation of the plants, it is therefore, essential that safety is improved. In july 1991, the Commission of the European Communities (CEC) instituted a Six Months Emergency Action Programme

for Bulgaria under the PHARE regional nuclear safety programme. The programme consisted of three parts: - an industrial emergency programme supporting the utility of the Kozloduy NPP, - a study to evaluate Bulgaria's electricity needs, - technical assistance for reinforcement of the Bulgarian Nuclear Safety Authority. For the third part, complementary to the industrial emergency programme carried out by the WANO (World Association of Nuclear Operators), a Consortium of expert institutions and regulatory from EC member states was established by CEC for assistance to BNSA. The Consortium consisted of: - Institut de Protection et de Surete Nucleaire (IPSN), France, technical support of the French regulatory body, - Gesellschaft fur Anlagen und Reaktorsicherheit (GRS) mbH, Germany, an organization in safety engineering, technical support of governmental regulatory body, - AIB-Vincotte Nuclear (AVN), Belgium, the organization authorized by the Belgian Government for licensing and inspection of nuclear power plants, - UK Atomic Energy Authority (AEA Technology), an independent UK Government owned nuclear R and D and consultancy organization, - Nuclear Installations Inspectorate (NII) of the Health and Safety Executive, United Kingdom, the nuclear regulatory body for the United Kingdom.

26127 (CONF-9210209–3) **Large-scale thermal-shock experiments with clad and unclad steel cylinders.** Cheverton, R.D. Oak Ridge National Lab., TN (United States). [1992]. 21p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From Organization for Economic Co-Operation Development/International Atomic Energy Agency/Commission of Safety Nuclear Installations (OECD/IAEA/CSNI) joint international specialists meeting on fracture mechanics verification by large scale testing; Knoxv Order Number DE93015447. Source: OSTI; NTIS; INIS; GPO Dep.

Flaw behavior trends associated with pressurized-thermal-shock (PTS) loading of pressurized-water-reactor pressure vessels have been under investigation at the Oak Ridge National Laboratory for nearly 20 years. During that time, twelve thermal-shock experiments with thick-walled (152 mm) steel cylinders were conducted as a part of the investigations. The first eight experiments were conducted with unclad cylinders initially containing shallow (8–19 mm) two-dimensional and semicircular inner-surface flaws. These experiments demonstrated, in good agreement with linear elastic fracture mechanics, crack initiation and arrest, a series of initiation/arrest events with deep penetration of the wall, long crack jumps, arrest with the stress intensity factor (K_I) increasing with crack depth, extensive surface extension of an initially short and shallow (semicircular) flaw, and warm prestressing with $K_I \leq 0$. The remaining four experiments were conducted with clad cylinders containing initially shallow (19–24 mm) semielliptical subclad and surface flaws at the inner surface. In the first of these experiments one of six equally spaced (60°) "identical" subclad flaws extended nearly the length of the cylinder (1,220 mm) beneath the cladding (no crack extension into the cladding) and nearly 50% of the wall, radially. For the final experiment, four of the semielliptical subclad flaws that had not propagated previously were converted to surface flaws, and they experienced extensive extension beneath the cladding with no cracking of the cladding. Information from this series of thermal-shock experiments is being used in the evaluation of the PTS issue.

26128 (DOE/SF/19682–T1-Vol.2) **DOE plutonium disposition study: Pu consumption in ALWRs: Volume 2, Final report.** ABB/Combustion Engineering, Inc., Windsor, CT (United States). 15 May 1993. 285p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-93SF19682. Order Number DE93013226. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) has contracted with Asea Brown Boveri-Combustion Engineering (ABB-CE) to provide information on the capability of ABB-CE's System 80 + Advanced Light Water Reactor (ALWR) to transform, through reactor burnup, 100 metric tonnes (MT) of weapons grade plutonium (Pu) into a form which is not readily useable in weapons. This information is being developed as part of DOE's Plutonium Disposition Study, initiated by DOE in response to Congressional action. This document Volume 2, provides a discussion of: Plutonium Fuel Cycle; Technology Needs; Regulatory Considerations; Cost and Schedule Estimates; and Deployment Strategy.

26129 (EDF–93-NB-00005) **Development of RCM methodology and tools for EDF nuclear power plants.** Jacquot, J.P.; Bouchet, J.L.; Despujols, A.; Dewailly, J.; Martin-Mattei, C. Electricite de France (EDF), 92 - Clamart (France). Jun 1992. [15p.] (In French). Order Number DE93631499. Source: OSTI; NTIS (US Sales Only); INIS.

This paper outlines the development of Reliability-Centered Maintenance procedures in the nuclear power industry. It presents the pilot study undertaken by EDF in the overall framework of its 'OMF' (RCM) project, as well as the potential for further improving and enriching analytical methods. Lastly, it gives the prospects for the future design of an 'OMF' workstation.

26130 (EDF–93-NJ-00002(Rev.)) **Compiling models into real-time systems.** Dormoy, J.L.; Cherriaux, F.; Ancelin, J. Electricite de France (EDF), 92 - Clamart (France). Aug 1992. [14p.] (In French). Order Number DE93631500. Source: OSTI; NTIS (US Sales Only); INIS.

This paper presents an architecture for building real-time systems from models, and model-compiling techniques. This has been applied for building a real-time model-based monitoring system for nuclear plants, called KSE, which is currently being used in two plants in France. We describe how we used various artificial intelligence techniques for building it: a model-based approach, a logical model of its operation, a declarative implementation of these models, and original knowledge-compiling techniques for automatically generating the real-time expert system from those models. Some of those techniques have just been borrowed from the literature, but we had to modify or invent other techniques which simply did not exist. We also discuss two important problems, which are often underestimated in the artificial intelligence literature: size, and errors. Our architecture, which could be used in other applications, combines the advantages of the model-based approach with the efficiency requirements of real-time applications, while in general model-based approaches present serious drawbacks on this point.

26131 (EGG-M–92494) **Engineering reliability in design phase: An application to AP-600 reactor passive safety system.** Majumdr, D. (USDOE Idaho Field Office, Idaho Falls, ID (United States)); Siahpush, A.S.; Hills, S.W. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-921003–11: International conference on design and safety of advanced nuclear power plants, Tokyo (Japan), 25-28 Oct 1992). Order Number DE93013661. Source: OSTI; NTIS; INIS; GPO Dep.

A computerized reliability enhancement methodology is described that can be used at the engineering design phase to help the designer achieve a desired reliability of the system. It can take into account the limitation imposed by a constraint such as budget, space, or weight. If the desired reliability of the system is known, it can determine the minimum reliabilities of the components, or how many redundant components are needed to achieve the desired reliability. This methodology is applied to examine the Automatic Depressurization System (ADS) of the new passively safe AP-600 reactor. The safety goal of a nuclear reactor dictates a certain reliability level of its components. It is found that a series parallel valve configuration instead of the parallel-series configuration of the four valves in one stage would improve the reliability of the ADS. Other valve characteristics and arrangements are explored to examine different reliability options for the system.

26132 (EUR–14043/1) **Assessment of management alternatives for LWR wastes. Volume 1. Main achievements of the joint study.** Glibert, R.C. (Belgatom SA, Brussels (Belgium)). Commission of the European Communities, Luxembourg (Luxembourg). 1993. [122p.] Contract FI1W/0124-B. Source: OSTI; NTIS (US Sales Only); INIS.

This report deals with the main achievements of a joint theoretical study aimed at evaluating a selection of management routes for LWR wastes, relying to a certain extent on national practices in this particular area, on the basis of economical and radiological criteria. All individual intermediate steps entering a management route, from radioactive-wastes production up to their disposal in

near-surface sites or in a deep repository, have been identified, described and cost-evaluated throughout the study. The radiological impact assessment comprises estimates of both individual and collective doses resulting from normal discharges of radioactive effluents and from disposal of radioactive waste products in near-surfaces sites. All specific data concerning the description of the different management routes considered as well as the methodology applied to evaluate cost and radiological impact are detailed in the subsequent volumes of the series (Volumes 2 to 8).

26133 (EUR–14043/2) **Assessment of management alternatives for LWR wastes. Volume 2. Description of a French scenario for PWR waste.** Saulieu, E. de (Societe Generale pour les Techniques Nouvelles (SGN), 78 - Saint-Quentin-en-Yvelines (France)); Chary, C. Commission of the European Communities, Luxembourg (Luxembourg). 1993. [99p.] Contract FI1W/0132-F. Source: OSTI; NTIS (US Sales Only); INIS.

This report deals with the description of a management route for PWR waste relying to a certain extent on French practices in this particular area. This description, which aims at providing input data for subsequent cost evaluation, includes all management steps which are usually implemented for solid, liquid and gaseous wastes from their production up to the interim storage of the final waste products. This study is part of an overall theoretical exercise aimed at evaluating a selection of management routes for LWR waste based on economical and radiological criteria.

26134 (IAEA-TECDOC–697, pp. 25-31) **Fission gas release and fuel temperature during power transients in water reactor fuel at extended burnup.** Knudsen, P. (Risoe National Lab., Roskilde (Denmark)); Bagger, C.; Mogensen, M.; Toftegaard, H. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

Data on transient fission gas release and fuel temperature have been obtained with refabricated test fuel pins that were instrumented with pressure transducers and centre line fuel thermocouples. Major test variables were: fuel type, burnup, transient power history, fill gas, refabricated/unopened fuel segments. The previously irradiated test fuels (15-48 MWd/kgU) were provided by ANF, GE and Riso. A total of 15 transient tests were performed. The maximum power was usually around 350-400 W/cm. The hold time at maximum power ranged from a few hours to six days. The test fuels were characterized extensively after base irradiation and after transient testing. These investigations were carried out in the framework of the Third Riso Fission Gas Project. The paper presents an overview of the experiments and of the major results thus obtained. (author). 4 refs, 7 figs, 3 tabs.

26135 (IAEA-TECDOC–697, pp. 32-37) **Fission gas release below 20 kWm^{-1} in transient tested water reactor fuel at extended burnup.** Mogensen, M. (Risoe National Lab., Roskilde (Denmark)); Bagger, C.; Toftegaard, H.; Knudsen, P.; Walker, C.T. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

One of the fuel types transient tested in the Third Riso Fission Gas Project released 5-7% of its fission gas in the power range 3.6 to 17 kWm^{-1} during the ramp. Isotopic analysis revealed that compared with fission gas released at powers above 30 kWm^{-1} this gas contained lower concentrations of ^{83}Kr and ^{131}Xe. This suggests that it had left the UO_2 matrix during the base irradiation and had been for a long period isolated from the rest of the gas generated. It is proposed, therefore, that the gas released at low power had emanated from large pores, which were vented when the fuel cracked during the ramp. (author). 9 refs, 5 figs, 5 tabs.

26136 (IAEA-TECDOC–697, pp. 38-44) **Experimental assessment of a temperature threshold for thermally induced fission gas release in transient tested water reactor fuel with extended burnup.** Bagger, C. (Risoe National Lab., Roskilde (Denmark)); Mogensen, M. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

In-pile measurements of gas release and fuel temperature in The Third Riso Fission Gas Project show that onset of fission gas release during mild power transients takes place at a fuel temperature close to 1200 deg. C. Evaluation of PIE results together with the temperature measurements confirms the temperature level and indicates that the onset temperature is independent of fuel type, burnup and hold time. The radial location of the 1200 deg. C isotherm moves towards the rim with increasing burnup and constant linear power, assumably because of formation of a thermal barrier at the rim. Consequently the fractional fission gas release increases with burnup. For one of the fuel types investigated fission gas release is complete after 42h at 1525 deg. C. The results suggest that the radial temperature distribution changes gradually from a parabola toward a square with increasing burnup. (author). 7 refs, 7 figs, 2 tabs.

26137 (IAEA-TECDOC–697, pp. 63-67) **Fission gas release of high burnup fuel.** Manzel, R. (Siemens AG Unternehmensbereich KWU, Erlangen (Germany)); Bodmer, R.P.; Bart, G. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

Fission gas release data are presented for PWR fuel rods with an enrichment of 3.8 w/o to 4.2 w/o U-235 designed for high burnup. These fuel rods were operated up to 4 cycles under realistic power conditions to target burnups of 54 MWd/kgU. As expected, the fission gas release of fuel rods of higher enrichment was generally higher compared to that of fuel rods of lower enrichment. However, whilst the fractional fission gas release of lower enriched fuel rods shows a tendency to increase with increasing burnup, the fractional release of higher enriched rods passes through a maximum at intermediate burnups, and then shows a tendency to saturate. The highest fractional fission gas release of about 10% was measured on fuel rods with large initial diametrical gaps between fuel and cladding, the lowest release values were found on fuel rods with small initial diametrical gap. These fuel rods showed a behaviour similar to that of the lower enriched fuel rods. The fission gas released in general originates from the center region of the pellets. The diameter of this region is dependent on fuel center temperature. However, microstructural examinations do also show an increase with increasing burnups in spite of decreasing fuel temperatures. The microstructural features observed can be correlated with distinct steps in fission gas release. (author). 5 refs, 6 figs.

26138 (IAEA-TECDOC–697, pp. 68-75) **Fission gas release enhancement at extended burnup: Experimental evidence from French PWR irradiation.** Forat, C. In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

Two families of 17x17 Fragema assemblies were irradiated for five cycles in French PWR; post-irradiation examinations performed

on rods extracted after each cycle showed interesting features linked to the different power histories the two families experienced. Particularly, the evolution of the fuel microstructure made it possible to single out the contribution of the athermal process, including the "rim effect", and the thermal process. The development of "high burnup" realistic models needs a correct evaluation of the thermal conductivity deterioration and the lowering of the gas release threshold as burnup proceeds. (author). 8 refs, 6 figs.

(CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

Of the analytical experiments carried out at CEA to study fuel behaviour at high burnups, special mention should be made of the study of the effects of moderate transients on fission gas release (importance of cracking associated with power variations), and SEM examination of fracture surface of various fuels (analysis of bubble populations and precipitates of associated metallic fission products). Several factors must be considered when analysing the results: radial specific power profile and its thermal effect, fission gas creation, oxygen balance, density and open porosity, gaseous swelling. This paper describes the principle of various tools (calculations or experiments) used to obtain information on all these points. Finally, a brief discussion is given of the study programmes relating to the effect of O/M ratio on fuel behaviour and to the major problem of caesium retention. (author). 11 refs, 4 figs.

26141 (IAEA-TECDOC–697, pp. 118-123) **Experimental techniques and results related to high burn-up investigations at the OECD Halden Reactor Project.** Wiesenack, W. (OECD Halden Reactor Project, Halden (Norway)). International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

Investigations of phenomena associated with extended or high burn-up comprise a considerable part of the fuel and materials research programme carried out at the OECD Halden Reactor Project, reflecting the interests and priorities of the nuclear industry in this area. For this purpose, sensors, re-instrumentation techniques, irradiation rigs and data evaluation methods have been developed and successfully applied which allow tests to be conducted at extended burn-up with high data quality. Re-instrumentation of base-irradiated fuel rods (50 MWd/kgU) with pressure transducers has been carried out with several rods, which were then subjected to high power, to study fission gas release. The results as well as those from another high burn-up test confirm the empirical fission gas release threshold developed at Halden, which predicts the onset of FGR to be about 1100 deg. C at this burn-up. The related interlinkage-resintering effects can be studied in special assemblies allowing sweep-out and analysis of fission products. Comprehensive investigations of fuel temperature data suggest a gradual degradation of UO_2 thermal conductivity with burn-up. A special experiment is presently being irradiated to burn-up beyond 60 MWd/kgU, where the accuracy of temperature measurements is maintained by utilising expansion thermometers, insensitive to irradiation induced decalibration. A preliminary evaluation of the temperature increase points to a UO_2 conductivity degradation of 35% at 50 MWd/kgUO_2 and 600 deg. C. (author). 5 refs, 5 figs.

26142 (IAEA-TECDOC–697, pp. 124-130) **Review of Studsvik's international fuel R and D projects.** Grounes, M. (Studsvik Nuclear, Nykoeping (Sweden)); Djurle, S.; Lysell, G.; Mogard, H. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

Since 1975, a series of international fuel R and D projects, primarily addressing the PCI/SSC failure phenomenon have been conducted under the management of Studsvik Nuclear. These projects have been pursued under the sponsorship of different groups of fuel vendors, nuclear power utilities, national R and D organizations and, in some cases, licensing authorities in Europe, Japan and the U.S. In most of the projects the clad failure occurrence was studied under power ramp conditions utilizing the special ramp test facilities of the R2 test reactor. The current projects are not limited to PCI/SCC studies but some of them also include other aspects of fuel performance, such as end-of-life rod overpressure. An overview of the nine projects hat have been completed and six of the projects that are currently in progress or planned is given. During the late 1970's and 1980's the series of international ramp projects branched out in two directions. One series was initially concentrated on the PCI (Pellet-Cladding-Interaction) phenomena under normal operational conditions in different types of BWR and PWR fuel rods subjected to increased burn-up under normal operational conditions. These projects were in a broad sense aimed at decreasing the fuel costs by increases in fuel utilization and reactor availability. The other series was concentrated on more safety-oriented issues, aimed at providing data for fuel-related safety considerations. The first-mentioned series includes the INTER-RAMP, OVER-RAMP, DEMO-RAMP I, SUPER-RAMP, SUPER-RAMP EXTENSION, SUPER-RAMP II/9x9 and SUPER-RAMP III projects. The second series includes the INTER-RAMP, DEMO-RAMP II, TRANS-RAMP I, TRANS-RAMP II, TRANS-RAMP III and TRANS-RAMP IV projects. Furthermore information is also given on the ROPE I, ROPE II and DEFEX projects. (author). 16 refs, 2 tabs.

Source: OSTI; NTIS (US Sales Only); INIS.

Fission and technological gases release into the free fuel rod volume has been measured by means of μ-spectroscopy and mass-spectroscopy. Fuel rods for examination were taken from fuel assemblies with burnups ranging from 20 to 50 MW.d/Kg U. It was found that the amount of fission gas release for intact fuel rods is not significant, e.g. the share of released Kr-85 has no exceeded 2.5%. In some cases the increased fission gas release was observed for defected fuel rods. With the use of irradiation history data, information on fuel rod design and results of fuel rod parameters measurements in hot cells, calculations of fission gas release into rod free volume were carried out. Results of calculations and measurements were compared. (author). 1 ref., 11 figs, 5 tabs.

26145 (IAEA-TECDOC–697, pp. 145-153) **Hot cell fission gas release studies on UO_2.** Coquerelle, M. (Commission of the European Communities, Karlsruhe (Germany). European Inst. for Transuranium Elements); Bottomley, D. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

UO_2 fuels irradiated at burn-up between 30 and 58 GWd/t and at average linear power ranging from 35 to 20 KWm^{-1} have been investigated in the α,γ laboratory at the Institute for Transuranium Elements. The aim of this study was to determine the influence of increasing burn-up on fission gas release and the relationship between gas release and the fuel microstructure. A first study was undertaken by analysing fuel irradiated in power reactors and the results were reported at an IAEA technical meeting held in Studsvik in 1990. Furthermore, an additional programme was developed aiming at a better understanding of the influence of burn-up, fuel grain size, oxygen potential and temperature on fission gas release. Within the frame of this research our Institute carried out annealing tests in hot cells as part of the Research Programme of the Commission of the European Communities and of the international project High Burn-up Chemistry managed by Belgonucleaire. In these experiments the release of ^{85}Kr is measured during the annealing of irradiated UO_2 samples under H_2O:H_2=1:10, He/2%H_2, and CO_2:CO=10:1 atmospheres. The fuel restructuring as a consequence of the annealing was analysed by optical microscopy and SEM. The analysed fuels were provided by three European nuclear fuel manufacturers: KWU-Siemens, BN and ASEA-ABB. At the present time this study gives qualitative kinetic information on the influence of the different parameters chosen. The results support the view that an increase of the fission gas diffusion rate is caused by increasing burn-up and by annealing under oxidic atmospheres and by decreasing fuel grain size. (author). 3 refs, 10 figs, 2 tabs.

26146 (IAEA-TECDOC–697, pp. 172-176) **Intergranular fission gas bubbles and solid precipitates in UO_2 irradiated at high burnup in various conditions.** Charles, M. (CEA Centre d'Etudes de Grenoble, 38 (France)); Eminet, G.; Lemaignan, C. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

With a view to gaining a better understanding of fission gas release mechanisms at high burnups, the microstructures of three types of nuclear fuel of initial density close to 10.4 $g.cm^{-3}$ were studied: spheres of 1 mm diameter irradiated up to 20 GWd/THM at 900, 1200 and 1500 deg. C, pellets of PWR type irradiated to 22 GWd/THM, with centre-line temperature of the order of 1500 deg. C, and PWR pellets irradiated to 35 GWd/THM in a power reactor and then subjected to a number of transients between 200 and 300 $W.cm^{-1}$ in an experimental reactor. SEM examination of fracture surfaces of these various fuels shows that, below 900 deg. C, no bubbles are visible. At 1200 deg. C, the nucleation of intergranular bubbles is clearly apparent, accompanied by metallic precipitates. At 1400-1500 deg. C, apart from a tendency for grain growth, it was found that the bubbles coalesce to a considerable degree, with accompanying start of porosity interconnection and formation of tunnels at grain edges. In cases where power transients were applied, this interconnection phenomenon is particularly marked in areas having reached 1300 deg. C in the plateau phase. The metallic precipitates associated with the bubbles were analysed by the EDS SEM system. Three classes of precipitates were distinguished, with a typical composition being given for each of them. These results must be supplemented by ceramographs and TEM examination. (author). 11 refs, 4 figs, 3 tabs.

NFI has developed and has been utilizing FPAC code (Fuel Performance Analysis Code) to analyze fuel behavior. Two main models in FPAC were revised in 1988 to expand the capability of the code based on the available high burnup fuel data at that time. Fission gas release from pellets (FGR) is modelled in FPAC based on diffusion theory. Diffusion constant in the model consists of three terms: K1, K2 and K3. K1 models the gas channels through grain boundaries and was revised to be more sensitive to fuel temperature. K2 models FGR enhancement by burnup increase and was adjusted to be less sensitive to burnup. K3 models the gas channels through open porosities. As a total, these constants were adjusted to minimize the error of code prediction. A new pellet relocation model was introduced into the code to predict the fuel temperature and clad deformation accurately. FGR is sensitive to fuel temperature and the code prediction is closely related to these models. 7 refs, 8 figs, 3 tabs.

26148 (IAEA-TECDOC–697, pp. 205-211) **Evaluation of measured high burnup fuel temperature at Riso project phase 3.** Kitajima, S. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)); Kinoshita, M. International Atomic Energy Agency, Vienna (Austria). Apr 1993. In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

We developed an effective thermal conductivity model of pellet which includes effects of open spaces in pellet and fission product solid solution. At Riso project phase 3, measured fuel central temperature indicated that the effective thermal conductivity of pellet decreased as burnup increased. This project also examined the relation of filled gas component and fuel temperature. We evaluated

Riso data utilizing the fuel performance evaluation code involving the model, and found out that the effective thermal conductivity of pellet decreased about 25% at 40 MWd/kgUO2. The code could simulate the observed temperature drop of Xenon filled rod after fission gas burst release at Riso project. And the analyses of the Riso data show that contribution of the open spaces for the thermal conductivity degradation is more than 30% of the total degradation. (author). 8 refs, 11 figs, 1 tab.

26149 (IAEA-TECDOC–697, pp. 211-218) **A simple fission gas release/gaseous swelling model.** Kogai, T. (Nippon Nuclear Fuel Development Co. Ltd., Oarai, Ibaraki (Japan)). International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

A model was developed to evaluate fission gas release and gaseous swelling of LWR fuels. The model described gas atom behavior via transport of gas atoms from in-grain to grain boundary sites, formation of intergranular gas bubbles, and release of gas atoms to the rod free volume. The release considered of two competing mechanisms, i.e bubble growth and pellet microcracking. The microcracking used tensile stress in a pellet fragment as its index. Agreement, which validated the overall model formulation, was obtained between the calculated and measured fission gas releases. The abrupt gas release observed at power reduction was simulated by the microcracking model. Comparison of the gas atom retention distribution showed that the model currently responded to the temperature rise and simulated the EPMA measured profile satisfactorily. 26150 (IAEA-TECDOC–697, pp. 219-224) **An approach to modelling fuel behaviour using data from some international high burnup fuel programmes.** Nordstroem, L.A. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Ott, C. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

The well-defined fuel rod tests from the international research programmes TRIBULATION and High Burnup Effects Programme have provided a large amount of fuel performance data for computer code verification and validation. This report describes the calculation approach used to simulate the fuel rod deformations and fission gas release focused on some rods irradiated to high burnups. The TRANSURANUS computer code was used for the calculations. In a first phase the fuel densification input parameter as well as the fuel swelling and clad creep-down rates have been adjusted in order to reproduce the measured end-of-life clad dimensional changes. The agreement was very good. The experimental fission gas releases were then compared with the values predicted by three different models. Besides the standard model URGAS also the Halden model as well as the one from Framatome were implemented in TRANSURANUS. A significant discrepancy was found not only between the different models but also between the measured fission gas release values. The achieved result was discussed and some conclusions from this first step on the way to develop a new model at PSI to be used with TRANSURANUS were drawn. (author). 11 refs, 4 figs.

26151 (IAEA-TECDOC–697, pp. 225-230) **Fuel performance modeling of high burnup fuel.** Shann, S.H. (Siemens Nuclear Power Corp., Richland, WA (United States)); Swam, L.F. van. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

A Siemens Nuclear Power Corporation (SNP) developed fuel performance code with its diffusion controlled fission gas release model was modified for high burnup application. The modeling changes included a modification of fuel thermal conductivity, addition of the pellet rim effect, and modifications of the fission gas release model. With the data obtained in the High Burnup Effects Program, various aspects of the code were validated: Prediction of retained gas inside fuel grain versus EPMA (electron probe microanalysis) measured Xe data; Prediction of total retained gas (inside grain and in grain boundary) versus XRF (X-ray fluorescence) measured Xe data; Prediction of Pu production versus EPMA measured Pu/U data; Prediction of radial burnup distribution versus EPMA measured Nd data. The validation results indicate that the modified code accurately accounts for the fuel pellet rim effect and with a high degree of accuracy predicts the pellet burnup profile, retained fission gas, and fission gas released to the rod free volume up to high burnup. (author). 8 refs, 6 figs, 1 tab.

26152 (IVO-A–11/92) **Loviisa nuclear power plant analyzer.** Porkholm, K. (Imatran Voima Oy, Vantaa (Finland)); Nurmilaukas, P.; Tiihonen, O.; Haenninen, M.; Puska, E. Imatran Voima Oy (IVO), Helsinki (Finland). Dec 1992. [68p.] Order Number DE93629708. Source: OSTI; NTIS; INIS.

The APROS Simulation Environment has been developed since 1986 by Imatran Voima Oy (IVO) and the Technical Research Centre of Finland (VTT). It provides tools, solution algorithms and process components for use in different simulation systems for design, analysis and training purposes. One of its main nuclear applications is the Loviisa Nuclear Power Plant Analyzer (LPA). The Loviisa Plant Analyzer includes all the important plant components both in the primary and in the secondary circuits. In addition, all the main control systems, the protection system and the high voltage electrical systems are included. (orig.).

26153 (JAERI-M–93-032) **Assessment of TRAC-PF1/MOD1 code for core thermal hydraulic behavior during reflood with CCTF and SCTF data.** Akimoto, Hajime (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Ohnuki, Akira; Murao, Yoshio; Kikuta, Michitaka. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 202p. Order Number DE93508319. Source: OSTI; NTIS; INIS.

Post test calculations for six selected Cylindrical Core Test Facility (CCTF) and Slab Core Test Facility (SCTF) tests were performed to assess the TRAC-PF1 code for core thermal hydraulic behaviors during the reflood in a PWR LOCA. It was found through comparisons of calculated results with measured results that predicted void fraction and core mass with the TRAC-PF1 code showed poor agreement with measured results in quantity and that the TRAC-PF1 code predicted well turnaround time, turnaround temperature and quench time in clad temperature transient including parameter effect of system pressure and core power level. In the calculation for the CCTF best-estimate test, which was performed with low initial clad temperature, the TRAC-PF1 code predicted higher core cooling rate and faster quench propagation than measured results. A study on the interfacial friction model and wall heat transfer model was performed to identify problem areas of the TRAC-PF1 code. It is recommended to improve following models of the TRAC-PF1 code for more realistic prediction of core thermal hydraulic behaviors during the reflood in a PWR LOCA: (1) Interfacial friction model in the bubbly/slug flow regime, (2) Interfacial friction model in the vicinity of the flow transition point from the churn flow to the annular/dispersed flow, (3) Wall heat transfer model in the film boiling regime, and (4) Wall heat transfer model on the criteria for the boiling transition from the film boiling to the transition boiling at low initial clad temperature. (author).

26154 (KTM/E-B–125) **YKAe - Nuclear power plant systems behaviour and operational aspects of safety: Evaluation of research programme 1990-1992.** Hayns, M.R. (AEA Reactor Services, Harwell (United Kingdom)); Wolfert, K.; Sandervaag, O. Ministry of Trade and Industry, Helsinki (Finland). Energy Dept. Dec 1992. [40p.] Order Number DE93629709. Source: OSTI; NTIS; INIS.

Finland's energy research programmes.

The report is a mid term evaluation of the YKAe programme started in 1990. In the area safe margins of nuclear fuel and reactor core the work in support of improved performance of LWR fuel is primarily an economic matter and, therefore, should be funded directly by the utilities. As regards assessment of transient and accident situations the experiments in the PACTEL facility provide conditions for VVER reactors which are not available anywhere else. Every effort should be made to utilize this facility in further international programmes. The analysis methods developed for accident and the fire risk studies are excellent and well focused in the specific needs of the Finnish programmes. Further activities in transient and accident modelling should be coupled with the work of the APROS programme. Studies on the new technology in supervision and control of nuclear power plant processes are of special importance to Finland either for the 5th nuclear power station or for the upgrading existing systems. The work on computerized operator support systems looks to be achieving maturity and should be considered for more downstream funding. The human factors studies are of direct relevance to reactor operations. The human factors research appears sub-critical and deserves more support. Overall, the Evaluation Team felt that this small programme was well focused on Finland's needs, well integrated into the international programmes and provided good value for money. The programme direction and balance is good, and with only minor shift emphasis, should carry on its projected course.

26155 (NUREG/IA–0090) **Assessment of RELAP5/MOD2 using the test data of REWET-II reflooding experiment SGI/R.** Haemaelaeinen, A. (Valtion Teknillinen Tutkimuskeskus, Helsinki (Finland). Nuclear Engineering Lab.). Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Valtion Teknillinen Tutkimuskeskus, Helsinki (Finland). Nuclear Engineering Lab. May 1993. 32p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

An analysis of a reflooding experiment with RELAP5/MOD2 cycle 36.04 is presented. The experiment had been carried out in the REWET-II facility simulating the reactor core with a bundle of 19 electrically heated rods. On the basis of the results of two calculations recommendations for the core nodalization are presented, and a modification to the code is proposed.

26156 (NUREG/IA–0100) **Assessment of CCFL model of RELAP5/MOD3 against simple vertical tubes and rod bundle tests: International Agreement Report.** Cho, S. (Korea Electric Power Corp., Taejon (KR). Research Center); Arne, N.; Chung, B.D.; Kim, H.J. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Korea Electric Power Corp., Taejon (Korea, Republic of). Research Center; Korea Inst. of Nuclear Safety, Taejon (Korea, Republic of). Jun 1993. 114p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

Prepared as part of The Agreement on Research Participation and Technical Exchange under the International Thermal-Hydraulic Code Assessment and Application Program (ICAP).

The CCFL model used in RELAP5/MOD3 version 5m5 has been assessed against simple vertical tubes and bundle tests performed at a facility of Korea Atomic Energy Research Institute. The effect of changes in tube diameter and nodalization of tube section were investigated. The roles of interfacial drags on the flooding characteristics are discussed. Differences between the calculation and the experiment are also discussed. A comparison between model assessment results and the test data showed that the calculated value lay well on the experimental flooding curve specified by user, but the pressure jump before onset of flooding was not calculated.

26157 (NUREG/IA–0106) **Assessment of PWR Steam Generator modelling in RELAP5/MOD2: International Agreement Report.** Putney, J.M. (National Power, Leatherhead (GB). Technology and Environment Centre); Preece, R.J. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; National Power, Leatherhead (United Kingdom). Technology and Environment Centre. Jun 1993. 112p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (TEC/L–0471/R91). Source: OSTI; NTIS; INIS; GPO.

Prepared as part of The Agreement on Research Participation and Technical Exchange under the International Thermal-Hydraulic Code Assessment and Application Program (ICAP).

An assessment of Steam Generator (SG) modelling in the PWR thermal-hydraulic code RELAP5/MOD2 is presented. The assessment is based on a review of code assessment calculations performed in the UK and elsewhere, detailed calculations against a series of commissioning tests carried out on the Wolf Creek PWR and analytical investigations of the phenomena involved in normal and abnormal SG operation. A number of modelling deficiencies are identified and their implications for PWR safety analysis are discussed – including methods for compensating for the deficiencies through changes to the input deck. Consideration is also given as to whether the deficiencies will still be present in the successor code RELAP5/MOD3.

26158 (NUREG/IA–0108) **Assessment of RELAP5/MOD2 against a turbine trip from 100% power in the Vandellos II nuclear power plant.** Llopis, C. (Asociacion Nuclear Vandellos, Barcelona (ES)); Perez, J.; Mendizabal, R. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Asociacion Nuclear Vandellos, Barcelona (Spain); Consejo de Seguridad Nuclear, Madrid (Spain). Jun 1993. 54p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (ICSP–V2-R100-R). Source: OSTI; NTIS; INIS; GPO.

An assessment of RELAP5/MOD2 cycle 36.04 against a turbine trip from 100% power in the Vandellos II NPP (Spain) is presented. The work is inscribed in the framework of the Spanish contribution to ICAP Project. The model used in the simulation consists of a single loop, a steam generator and a steam line up to the steam header all of them enlarged on a scale of 3:1; and full-scaled reactor vessel and pressurizer. The results of calculations have been in reasonable agreement with plant measurements. An additional study has been performed to check the ability of a model in which all the plant components are full-scaled to reproduce the transient. A second study has been performed using the Homogeneous Equilibrium Model in the pressurizer, trying to elucidate the influence of the velocity slip in the primary depressurization rate.

26159 (NUREG/IA–0109) **Assessment of RELAP5/MOD2 against a 10% load rejection transient from 75% steady state in the Vandellos II Nuclear Power Plant.** Llopis, C. (Asociacion Nuclear Vandellos, Barcelona (ES)); Casals, A.; Perez, J.; Mendizabal, R. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Asociacion Nuclear Vandellos, Barcelona (Spain); Consejo de Seguridad Nuclear, Madrid (Spain). May 1993. 53p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (UNID–91-08). Source: OSTI; INIS; GPO; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020.

The Consejo de Seguridad Nuclear (CSN) and the Asociacion Nuclear Vandellos have developed a model of Vandellos II Nuclear Power Plant. The ANV collaboration consisted in the supply of design and actual data, the cooperation in the simulation of the control systems and other model components, as well as in the results analysis. The obtained model has been assessed against the following transients occurred in plant: A trip from the 100% power level (CSN); A load rejection from 100% to 50% (CSN); A load rejection from 75% to 65% (ANV); A feedwater turbopump trip (ANV). This copy is a report of the load rejection from 75% to 65% transient simulation. This transient was one of the tests carried out in Vandellos II NPP during the startup tests.

26160 (NUREG/IA–0116) **Assessment of RELAP5/MOD3/V5M5 against the UPTF Test No. 11 (countercurrent flow in PWR hot leg).** Curca-Tivig, F. (Siemens AG-KWU Group, Erlangen (DE)). Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Siemens AG Unternehmensbereich KWU, Erlangen (Germany). May 1993. 108p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (KWU–E412/91/E1002). Source: OSTI; NTIS; INIS; GPO.

Analysis of the UPTF Test No. 11 using the "best-estimate" computer code RELAP5/MOD3/Version 5M5 is presented. Test No. 11 was a quasi-steady state, separate effect test designed to investigate the conditions for countercurrent flow of steam and saturated water in the hot leg of a PWR. Without using the code's new countercurrent flow limitation (CCFL) model, RELAP5/MOD3/V5M5 overestimated the mass flow rate of back down flowing water up to 35% (1.5 MPa runs) and 43% (0.3 MPa runs). This is the most obvious difference to RELAP5/MOD2, which did not allow enough countercurrent flow. From the point of view of performing plant calculations this is certainty an improvement, because the new junction-based CCFL option could be used to restrict the flows to a flooding curve defined by a user-supplied correlation. Very good agreement with the experimental data for 1.5 MPa – which are relevant for SBLOCA reflux condensation conditions – could be obtained using the code's new CCFL option in the middle of the inclined part (riser) of the hot leg. Using the same CCFL correlation for the simulation of 0.3 MPa test series – typical for reflood conditions – the code underestimated by 44% the steam mass flow rate at which complete liquid carry over occurs. An unphysical result was received using a CCFL correlation of the Wallis type with the intercept C = 0.644 and the slope m = 0.8. The unphysical prediction is an indication of possible programming errors in the CCFL model of the RELAP5/MOD3/V5M5 computer code.

26161 (PNL–8451) **Spent nuclear fuel storage – Performance tests and demonstrations.** McKinnon, M.A.; DeLoach, V.A. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 142p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012875. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the results of heat transfer and shielding performance tests and demonstrations conducted from 1983 through 1992 by or in cooperation with the US Department of Energy (DOE), Office of Commercial Radioactive Waste Management (OCRWM). The performance tests consisted of 6 to 14 runs involving one or two loadings, usually three backfill environments (helium, nitrogen, and vacuum backfills), and one or two storage system orientations. A description of the test plan, spent fuel load patterns, results from temperature and dose rate measurements, and fuel integrity evaluations are contained within the report.

26162 (YJT–92-22) **Actinides and beta emitters in the process water and ion exchange resin samples from the Loviisa power plant.** Puukko, E. (Helsinki Univ. (Finland). Dept. of Radiochemistry); Jaakkola, T. Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Oct 1992. [63p.] Order Number DE93631504. Source: OSTI; NTIS; INIS.

The process waters and the ion exchange resins used for purification of the process waters of the Loviisa nuclear power plant, where are two VVER-440-type PWR reactors, were analysed for their concentrations of alpha and beta emitters. Co-60, Ni-63, Sr-90, Cs-137, U-234, U-238, Pu-239,240, Am-241, Cm-242 and Cm-243,244 were determined in the primary coolant, the ion exchange resins of the primary circuit and the waste tank TW30B03, which contains all used ion exchange resins. The coolant and ion exchange resin samples from the primary circuit represented the normal operation state and a fuel leakage situation. In addition, the concentrations of Tc-99 and I-129 were determined in the waste tank resins.

The calculational substantiation of SWPR posessing inherent physical properties of self-protection against possible accidents is given. A variety of approaches to the layout of these reactors have been found, the possible level of their fuel utilization characteristics is analyzed. 12 refs.; 14 figs.; 6 tabs.

26164 (INIS-GB–488) **Statement of nuclear incidents (1st. Qtr. 1990): Bradwell nuclear power station, Essex (Nuclear Electric).** Health and Safety Executive, London (United Kingdom). Jun 1990. [3p.] Order Number DE93631514. Source: OSTI; NTIS (US Sales Only); INIS.

Only one incident was reported; at Bradwell nuclear power station, where there was a leak of carbon dioxide gas. No radioactive contamination was detected and the amount of gas released was well within operating levels. (UK).

26165 (JAERI-M–92-215) **Proceedings of the 2nd JAERI symposium on HTGR technologies October 21 ≈ 23, 1992, Oarai, Japan.** Japan Atomic Energy Research Inst., Tokyo (Japan). Jan 1993. 726p. (CONF-9210382–: 2. JAERI symposium on HTGR technologies, Oarai (Japan), 21-23 Oct 1992). Order Number DE93508315. Source: OSTI; NTIS; INIS.

The Japan Atomic Energy Research Institute (JAERI) held the 2nd JAERI Symposium on HTGR Technologies on October 21 to 23, 1992, at Oarai Park Hotel at Oarai-machi, Ibaraki-ken, Japan, with support of International Atomic Energy Agency (IAEA), Science and Technology Agency of Japan and the Atomic Energy Society of Japan on the occasion that the construction of the High Temperature Engineering Test Reactor (HTTR), which is the first high temperature gas-cooled reactor (HTGR) in Japan, is now being proceeded smoothly. In this symposium, the worldwide present status of research and development (R and D) of the HTGRs and the future perspectives of the HTGR development were discussed with 47 papers including 3 invited lectures, focusing on the present status of HTGR projects and perspectives of HTGR Development, Safety, Operation Experience, Fuel and Heat Utilization. A panel discussion was also organized on how the HTGRs can contribute to the preservation of global environment. About 280 participants attended the symposium from Japan, Bangladesh, Germany, France, Indonesia, People's Republic of China, Poland, Russia, Switzerland, United Kingdom, United States of America, Venezuela and the IAEA. This paper was edited as the proceedings of the 2nd JAERI Symposium on HTGR Technologies, collecting the 47 papers presented in the oral and poster sessions along with 11 panel exhibitions on the results of research and development associated to the HTTR. (author).

(United Kingdom). School of Computer Studies. Dec 1991. [17p.] Order Number DE93628319. Source: OSTI; NTIS (US Sales Only); INIS.

As part of the International Chernobyl Project, five decision conferences were held with the Soviet authorities to identify the major factors driving decision making in relation to relocation and other protective measures which are being applied in the affected regions of Byelorussia, Ukraine and the Russian Federation. This report describes the running of those conferences and the conclusions reached from them. (Author).

26167 (ORNL/FTR–4412) **Testing and surveillance of corrosion for the steam generator (SG) materials of the New Production-Modular High-Temperature Gas-cooled Reactor program: Foreign trip report, August 31–September 5, 1992.** Bell, G.E.C. (Oak Ridge National Lab., TN (United States)); Funk, D.R. Oak Ridge National Lab., TN (United States). 5 Oct 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011398. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses meetings held between representatives from the NP-MHTGR SG design and testing organizations and NE [formerly Central Electricity Generating Board(CEGB)] to discuss secondary-side corrosion testing programs. Topics included water chemistry specification and control, flow-induced vibration and wear, materials, and corrosion. Discussions with CML were conducted on the technology and sensor design for the use of state-of-the-art electrochemical technology [electrochemical noise

(EN)] for conducting corrosion surveillance in both model boiler and autoclave test programs for the NP-MHTGR. The results of these meetings will significantly increase the quality of the testing programs and reduce the uncertainty and risk associated with the design of the NP-MHTGR SG.

26168 (IAEA-TECDOC–697, pp. 53-59) **Fission-gas release in fuel performing to extended burnups in Ontario Hydro nuclear generating stations.** Floyd, M.R. (Ontario Hydro, Chalk River, ON (Canada). Nuclear Operations Central Div.); Novak, J.; Truant, P.T. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

The performance of 37-element fuel at extended burnups is of interest to reactor operators who desire a better understanding of the limits of operation, particularly for fuel resident in fuel channels that cannot be refuelled for an extended period of time. The average discharge burnup of CANDU fuel is about 200 MWh/kgU. A significant number of 37-element bundles have achieved burnups in excess of 400 MWh/kgU. Some of these bundles have experienced failures related to their extended operation. To date, hot-cell examinations have been performed on fuel elements from nine 37-element bundles irradiated in Bruce NGS-A that have burnups in the range of 300-800 MWh/kgU. Most of these have declining power histories from peak powers of up to 59 kW/m. Fission-gas release of up to 26% have been observed and exhibit a strong dependence on fuel power. This obscures any dependence on burnup. The extent of fission-gas release at extended burnups was not predicted by low-burnup code extrapolations. This is attributed primarily to a reduction in fuel thermal conductivity which results in elevated operating temperatures. Reduced conductivity is due, at least in part, to the buildup of fission products in the fuel matrix. Some evidence of hyperstoichiometry exists, although this needs to be further investigated along with any possible relation to CANLUB graphite coating behaviour and sheath oxidation. Residual tensile sheath strains of up to 2% have been observed and can be correlated with fuel power/fission-gas release. SCC-related defects have been observed in the sheath and endcaps of elements from bundles experiencing declining power histories to burnups in excess of 500 MWh/kgU. This indicates that the current recommended burnup limit of 450 MWh/kgU is justified. SCC-related defects have also been observed in ramped bundles having burnups <450 MWh/kgU. Hence, additional guidelines are in place for power ramping extended-burnup fuel. (author). 6 refs, 9 figs, 1 tab.

26169 (IAEA-TECDOC–697, pp. 153-164) **Fission-product release kinetics from CANDU and LWR fuel during high-temperature steam oxidation experiments.** Cox, D.S. (Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs.); Liu, Z.; Elder, P.H.; Hunt, C.E.L.; Arimescu, V.I. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

The kinetics of Cs and Kr releases from high-burnup CANDU and LWR fuel were measured in hot-cell annealing experiments (HCE-2 series) under simulated severe accident conditions. The Zircaloy-clad specimens were heated in an inert environment and then exposed to flowing steam or air at atmospheric pressure between 1350 and 1650 deg. C. A simultaneous measurement of the oxidation rate of the fuel was made during these experiments. Both the CANDU and LWR fuels showed the same qualitative release behaviour. The Kr release kinetics could be divided into four different stages. During heating in inert conditions, a burst-release of Kr was detected starting at 1200 to 1400 deg. C. The initiating temperature and the quantity of gas released in this stage was found to depend on the irradiation history. The second stage occurred only in fuel heated above 1400 deg. C and could also be characterized as a burst-type release, although the peak rate and total quantity released in this stage increased with annealing temperature. A third peak of gas release occurred upon changing to an oxidizing environment. This peak was produced by a temperature escalation in the fuel resulting from exothermal oxidation of the Zircaloy. A final large gas release occurred after most of the Zircaloy cladding was oxidized, and presumably oxidation of the UO_2 was occurring. The kinetics of Cs release were similar to Kr except for lower Cs releases in the first stage, and a delay of several hundred to several thousand seconds relative to Kr, most notably in the first and fourth release stages. Differences and similarities between the CANDU and LWR results are discussed, and some of the HCE-2 data are compared to results from similar experiments conducted at the Oak Ridge National Laboratory. (author). 18 refs, 16 figs, 2 tabs.

26170 (IAEA-TECDOC–697, pp. 165-172) **Thermal conductivity and gas release from SIMFUEL.** Lucuta, P.G. (Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs.); Verrall, R.A.; Hastings, I.J.; Matzke, H. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

SIMFUEL - SIMulated high-burnup UO_2 FUEL - replicates the chemical state and microstructure of irradiated fuel. Non-radioactive elements in amounts equivalent to given burnup compositions are added to UO_2 powder. Thermal properties of UO_2 at high temperature are among the most important parameters in assessing fuel behaviour at high burnup. Changes in thermal conductivity occur in the fuel during irradiation as fission gas bubbles form and solid fission products (dissolved and precipitated) build up. The thermal diffusivity and specific heat of SIMFUEL were measured between 25 and 1500 deg. C, at two laboratories using two different techniques, with good agreement. These data were combined to obtain thermal conductivity. The conductivity of 3 and 8 at% burnup SIMFUEL was lower than for "pure" UO_2 by 29 and 45% at room temperature, and by 6 and 15% at 1500 deg. C. The decrease in thermal conductivity was approximately linear with burnup. An increase in central fuel temperature of about 200 deg. C was roughly estimated from the change in thermal conductivity reduction of 3 at% burnup SIMFUEL for a linear power of 45 kW/m, assuming no influence from gas bubbles. Isochronal and isothermal release of ion-implanted krypton from UO_2 and SIMFUEL specimens were measured under reducing conditions for gas concentrations which led to temporary trapping of the gas due to gas-defect interactions. Results for these conditions showed somewhat higher release rates from SIMFUEL. For example, at 1400 deg. C the release data from UO_2 and 8 at% burnup SIMFUEL corresponded to an increase by a factor of 7 in the effective diffusion coefficient. For comparison, the increase of 200 deg. C, in central temperature 1500 deg. C, would lead to a 3 times larger change in the diffusion coefficient. 27 refs, 7 figs, 1 tab.

26171 (IAEA-TECDOC–697, pp. 193-201) **Improvement of ELESIM CANDU fuel performance analysis code: Fission product gas release, fuel densification and neutron flux depression.** Suk, H.C. (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Hwang, W.; Kim, B.G.; Kim, K.S.; Heo, Y.H. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). 28 April - 1 May 1992. [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

KAERI has developed two major models which are a comprehensive fission gas release model and a mechanistic fuel densification model, and has expanded the ELESIM database of neutron flux depression in fuel. Based on MATPRO-Version 11(Rev.2), it has also updated the material properties such as fuel thermal conductivity, clad elastic moduli and clad thermal expansion used in ELESIM code of which most material properties are originated from MATPRO-Version 9. Using the KAERI developed models, the expanded database, and the updated material properties, KAERI has improved the ELESIM Computer Code and then the improved version of ELESIM has been designated as KAFEPA(KAERI/AECL Fuel Element Performance Analysis). The KAFEPA code was verified through comparison with fission gas release experimental data taken from AECL and KAERI irradiation tests. (author). 25 refs, 6 figs, 1 tab.

26172 (IAEA-TECDOC–697, pp. 183-193) **Modeling CANDU-type fuel behaviour during extended burnup irradiations using a revised version of the ELESIM code.** Arimescu, V.I. (Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs.); Richmond, W.R. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

High burnup database for CANDU fuel includes several cases from both power station and experimental reactor irradiations, with burnups of up to 800 MW.h/kgU. Power history for each of these cases is different, encompassing low steady-state, declining, and power-ramps. This variety offers a good opportunity to check the models of fuel behaviour, and to identify areas for improvement. Main parameters for comparing calculated versus measured data are fission gas release and sheath hoop strain. Good agreement of the two calculated parameters with experimental data indicates that the global behaviour of the fuel element is adequately simulated by our codes. The ELESIM computer code was used as the simulation tool. Models for fission gas release, swelling and fuel pellet expansion were thoroughly analysed. Changes were proposed for both models. Fuel pellet expansion model was modified to account for gaseous swelling, which becomes important at high burnups. Mathematics of the fission gas release model was upgraded for diffusional release of fission gas atoms to the grain boundaries. A revised version of the ELESIM computer code was used to simulate the cases from the high burnup database. Satisfactory agreement was found for most cases. Discrepancies are discussed in view of alternative mechanisms that can operate and be enhanced at high burnup. These include stoichiometry changes with burnup that affects fission gas release, and also outer pellet rim fission gas release by a grain boundary diffusion process. Main conclusion of this study is that the revised version of the ELESIM code is able to simulate with reasonable accuracy high burnup as well as low burnup CANDU fuel. This includes irradiations of steady-state, declining, or ramped fuel power histories with a prolonged hold at high power. However, future improvements to ELESIM are needed to model fuel power histories with short dwell times at a high terminal ramp power. (author). 19 refs, 11 figs.

The primary loop gas of an automatic control system of a nuclear power plant is of great importance as regards conservation and safety of the plant. These gases are produced by dissociation due to radiation effects on heavy water. The system is based on a sample capture equipment, a chromatographic analyzer with its associated electronics, a sample separator and conditioner, a temperature and pressure control system of the transport gas, all included in the reactor building, apart from other supporting instrumentation. (Author).

A program for the transients simulation thermohydraulic calculation without loss of coolant (KWU-ENACE development) to evaluate Atucha I nuclear power plant behaviour is used. The program includes systems simulation and nuclear power plants control bonds with real parameters. The calculation results show a good agreement with the output 'protocol' of various transients of the nuclear power plant, keeping the error, in general, lesser than ± 10% from the variation of the nuclear power plant's state variables. (Author).

The supply of materials to be used in the fabrication of components submitted to pressure destined to Atucha II nuclear power plant must fulfill the quality assurance requirements in accordance with the international standards. With the aim of promoting the national participation in CNA II, ENACE had the need to adapt these requirements to the national industry conditions and to the availability of official entities' qualification and inspection. As a uniform and normalized assessment for the qualification of materials did

not exist in the country, ENACE had to develop a materials suppliers qualification system. This paper presents a suppliers qualification procedure, its application limits and the alternative procedures for the acceptance of individual stock and for the stock materials purchase. (Author).

26178 (INIS-mf–12758, pp. 125-132) **35% of fracture in one of the Embalse nuclear power plant's entrance collectors.** Galia, A.V. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Ingenieria); Marinucci, L.N.M. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of this work is to simulate an accident of a 35% of fracture at the reactor's entrance collector with the FIREBIRD III code, Mod. 1.0, in order to compare the results obtained with those stated in the Safety Report, and besides, to verify the capacity to foresee the steam generator's secondary boundary behaviour on the basis of the actually available models. For this type of fractures, it is expected that this does not basically affect the Heat Transport Primary Loop behaviour since the main heat drain is the fracture. (Author).

26179 (INIS-mf–12758, pp. 133-137) **Loss of energy IV class at 100% of plain power (PP). FIREBIRD III contrast with the mentioned event at 88% of PP occurred at CNE (Embalse nuclear power plant) on February, 23rd., 1984.** Gersberg, S. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Ingenieria); Meneghelli, O.; Raviola, F.J.B. de; Lorenzetti, J.R. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The work consists of two objectives: (a) to simulate with the FIREBIRD III code an electrical energy loss of the IV class at 100% of plain power (PP); (b) contrast of the mentioned event of type IV loss when the plant operated at 88% of PP. In the case of 100% of PP, three kinds of calculation are made: (a) one of them oriented to the reactor's safety concept, that is, where the slower cut system acts; (2) oriented to analyze the STEPBACK effectiveness; (3) the control systems and cut systems act when the corresponding 'set points' are reached. The results compared with those obtained by the Hydna-3 code and other Canadian references, are satisfactory. In the case of 88%, the Embalse nuclear power plant's supplied information each 12 seconds in the TRIP LOG reactor, and each 1 second in the computer list, the necessary data for the simulation are not available. The transient, varying the parameters, delayed in trip and stepback, and the different cut times of feed water to the secondary loop, are analyzed. (Author).

26180 (INIS-mf–12758, pp. 144-148) **Atucha II nuclear power plant digital simulation.** Santome, D. (Investigacion Aplicada SE (INVAP), San Carlos de Bariloche (Argentina)); Rovere, L.A.T. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

This paper describes the start-up of a digital simulation code apt to be performed in real time of Atucha II nuclear power plant, foreseeing its subsequent usage in a Basic Principles Simulator. Adaptability and modification of existing routines and development of modules in order to incorporate the necessary variables dynamics to couple the different modes, were the main tasks. The mathematical model used allows the representation of the following sub-systems: (a) a reactor's core point model, which comprehends the neutronic kinetics, fission and decaying powers, thermal transfer and Xe-poisoning calculation; (b) pressurizer, which considers two sub-systems that may or may not be in thermodynamic equilibrium, both in two phases; (c) coolants and moderators bonds considering separate moderator loops with the aim of introducing asymmetric perturbations; (d) secondary sub-subsystem, which includes the feed water loop, pumps, steam generators and control valves; (e) steam generators; (f) control and safety systems, including power control, steam generators levels, moderator's temperature primary loop system, limitations and protection. (Author).

26181 (INIS-mf–12758, pp. 154-159) **Vibrations measurement at the Embalse nuclear power plant's electrical generator.** Salomoni, R.C. (Comision Nacional de Energia Atomica, Embalse (Argentina). Central Nuclear en Embalse); Belinco, C.G.; Pastorini, A.J.; Sacchi, M.A. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

After the modifications made at the Embalse nuclear power plant's electrical generator to reduce its vibration level produced by electromagnetic phenomena, it was necessary to perform measurements at the new levels, under different areas and power conditions. To this purpose, a work was performed jointly with the 'Vibrations Team' of the ANSALDO Company (the generator constructor) and the Hydrodynamic Assays Division under the coordination and supervision of the plant's electrical maintenance responsible. This paper includes the main results obtained and the instrumentation criteria and analysis performed. (Author).

26182 (INIS-mf–12758, pp. 418-425) **Irradiation program of slightly enriched fuel elements at the Atucha I nuclear power plant.** Casario, J.A. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Desarrollo); Cesario, R.H.; Perez, R.A.; Sidelnik, J.I. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

An irradiation program of fuel elements with slightly enriched uranium is implemented, tending to the homogenization of core at Atucha I nuclear power plant. The main benefits of the enrichment program are: (a) to extend the average discharge burnup of fuel elements, reducing the number of elements used to generate the same amount of energy. This implies a smaller annual consumption of elements and consequently the reduction of transport and replacement operations and of the storage pool systems as well as that of radioactive wastes; (b) the saving of uranium and structural materials (Zircaloy and others). In the initial stage of program an homogeneous core enrichment of 0.85% by weight of U-235 is anticipated. The average discharge burnup of fuel elements, as estimated by previous studies, is approximately 11.6 MW d/kg U. The annual consumption of fuel elements is reduced from 396 of natural uranium to 205, with a load factor of 0.85. It is intended to reach the next equilibrium steps with an enrichment of 1.00 and 1.20% in U-235. (Author).

26183 (INIS-mf–12758, pp. 426-431) **Distribution of equilibrium burnup for an homogeneous core with fuel elements of slightly enriched uranium (0.85% U-235) at Atucha I nuclear power plant.** Sidelnik, J.I. (Comision Nacional de Energia Atomica, Atucha (Argentina). Central Nuclear Atucha I); Perez, R.A.; Salom, G.F. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.*

Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

At Atucha I, the present fuel management with natural uranium comprises three burnup areas and one irradiation path, sometimes performing four steps in the reactor core, according to the requirements. The discharge burnup is 6.0 Mw d/kg U for a waste reactivity of 6.5 m k and a heavy water purity of 99.75%. This is a preliminary study to obtain the distribution of equilibrium burnup of an homogeneous core with slightly enriched uranium (0.85% by weight U-235), using the time-averaged method implemented in the code PUMA and a representative model of one third of core and fixed rod position. It was found a strategy of three areas and two paths that agrees with the present limits of channel power and specific power in fuel rod. The discharge burnup obtained is 11.6 Mw d/kg U. This strategy is calculated with the same method and a full core representation model is used to verify the obtained results. (Author).

26184 (INIS-mf–12758, pp. 437-448) **Results of fuel management at Embalse nuclear power plant. Analysis of performance at other plants.** Paz, A.O. de (Comision Nacional de Energia Atomica, Embalse (Argentina). Central Nuclear en Embalse); Moreno, C.A.; Vinez, J.C. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The operating experience of fuel management at the Embalse nuclear power plant from new core to the present situation (approximately 937 days at full power) is described. The average core burnup is about 4000 MW d/t U and the monthly averaged discharge burnup about 7800 MW d/t U. The neutron flux distribution is calculated by means of program PUMA-C, which is periodically checked by comparison between calculated and measured values of 102 vanadium detectors. A comparison of the performance of other reactors type CANDU 600 (Point Lepreau, Gentilly 2, Wolsung) from the point of view of fuel strategy is also presented. The data to perform the comparison were obtained by means of the CANDU system of information exchange between users (COG). (Author).

26185 (INIS-mf–12758, pp. 449-454) **Operation of Atucha I nuclear power plant with 25 cooling channels without fuel elements.** Perez, R.A. (Comision Nacional de Energia Atomica, Atucha (Argentina). Central Nuclear Atucha I); Sidelnik, J.I.; Salom, G.F. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

In view of the need of removing the irradiation probes from the reactor of Atucha I nuclear power plant, a study about the consequences of operating with 25 channels without their respective fuel elements was performed. This condition was simulated by means of the code PUMA symmetry I and the consequences were analyzed. From the study resulted a program of stepped power reduction of the nuclear plant that would take place during the process of channel emptying. (Author).

26186 (INIS-mf–12758, pp. 455-460) **National supply of reactivity control rods for Embalse nuclear power plant (CNE).** Biondo, C.D. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Ingenieria); Carloni, J.G.; Aba, J.A.; Ruggeri, I.; Arakelian, C.; Rubio, N. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The manufacture and supply on industrial scale of reactivity control rods for CNE (Embalse nuclear power plant) were developed by the National Atomic Energy Commission (CNEA) together with the private industry, as part of a program aimed to the substitution of imported supplies used in the operation of power plants by materials manufactured in Argentina. So far, the control rods were imported from Canada. In this work, the different development stages performed by CNEA and CONUAR S.A. are described, leading to the supply of a set of 21 cobalt rods to be included in a reactor of CNE in order to qualify this component. Among the main activities performed, the following stand out: specifications development, particularly those concerning to cobalt cores, evaluation of design documentation and elaboration of bidding conditions and a plan of manufacture and control. According to the results obtained during the service and the post-irradiation measurements, the design will be reviewed in order to undertake new manufacturing plans. (Author).

26187 (INIS-mf–12758, pp. 432-436) **Economical benefits for the use of slightly enriched fuel elements at the Atucha-I nuclear power plant.** Sidelnik, J.I. (Comision Nacional de Energia Atomica, Atucha (Argentina). Central Nuclear Atucha I); Sosa, M.A. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The fuel represents a very important factor in the operative cost of the Atucha I nuclear power plant. This cost is drastically reduced with the use of fuel elements of slightly enriched uranium. The annual saving is analyzed with actual values for fuel elements with an enrichment of 0.85% by weight of U-235. With the reactor core in equilibrium state the annual saving achieved is approximately 7.5-10 u$s. According to the present irradiation plan, the benefit for the transition period is studied. An analysis of the sensitivity to differential increments in factors determining the cost of fuel elements or to changes in manufacturing losses is also performed, calculating its effect on the waste, the storage of irradiated elements and the amount of UO_2 required. (Author).

26188 (INIS-mf–12758, pp. 576-580) **CNE (central nuclear en Embalse): probabilistic safety study. Loss-of-coolant accidents. Analysis through events sequence.** Layral, S.I. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Ingenieria). Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of this study was to perform for the Embalse nuclear power plant, a probabilistic evaluation of loss-of-coolant accidents (LOCA) to identify the risks associated with them and to determine their acceptability in accordance with norms. This study includes all ruptures in the primary system that produce the automatic activation of 'emergency core cooling system'. Three starting events were selected for the probabilistic evaluation: 100% rupture of an input collector; 5% rupture of an input collector; 1.2% rupture of an input collector. At this stage the evaluation is focussed on the identification and quantization of the main failure sequences that follow a LOCA and lead to an uncontrolled reactor state or 'core meltdown'. The most important contribution to the core meltdown due to LOCA is the failure of supplies that are required for the emergency core cooling system. (Author).

26189 (INIS-mf–12758, pp. 581-585) **CNE (Embalse nuclear power plant): probabilistic safety study. Electric power supply. Events sequence.** Figueroa, N. (Comision Nacional de Energia

Atomica, Buenos Aires (Argentina). Gerencia de Ingenieria). Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The plant response to the occurrence of the starting event 'total loss of electric power supply to class IV and class III' is analyzed. This involves the study of automatical actions of safety and process systems as well as the operator actions. The probabilistic evaluation of starting event frequency is performed through fault-tree techniques. The frequency of occurrence 'loss of electric power supply to class IV (λIV = 0.56/year) and the probability of failure to demand of 'reserve' generating groups (Pd III 6.79 x 10^{-3}) contribute to the mentioned frequency. As soon as the starting event occurs, the reactor power must be reduced to 0%, the fuel must be cooled through the thermo siphon and decay heat has to be removed. The events sequence analysis leads to the conclusion that the non shutting down of the reactor with any of the shutdown systems is 'incredible' (10^{-6}/year). In all cases the fuel is cooled by building the thermo siphon except when a substantial inventory loss exist due to a closure failure of some valve of pressure and inventory control system. The order of magnitude of the failure of decay heat removal through the steam generators is 4 x 10^{-4}. This removal would be assured by the emergency water system. Therefore, the frequency of the sequence of possible core meltdown, when the reactor does not shut down is: $\lambda = 5 \times 10^{-9}$/year and for the failure of heat removal: $\lambda = 2 \times 10^{-6}$/year. (Author).

26190 (INIS-mf–12758, pp. 586-590) **CNE (Embalse nuclear power plant): probabilistic safety study. Loss of service water. Probabilistic evaluation and analysis through events sequence.** Couto, A.J. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Ingenieria); Perez, S.S. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

This work is part of a study on the service water systems of the Embalse nuclear power plant from a safety point of view. The faults of service water systems of high and low pressure that can lead to situations threatening the plant safety were analyzed in a previous report. The event 'total loss of low pressure service water' causes the largest number of such conditions. Such event is an operational incident that can lead to an accident situation due to faults in the required process systems or by omission of a procedure. The annual frequency of the event 'total loss of low pressure service water' is calculated. The main contribution comes from pump failure. The evaluation of the accident sequences shows that the most direct way to the liberation of fission products is the loss of steam generators as heat sink. The contributions to small and large LOCA and electric supply loss are analyzed. The sequence that leads to tritium release through boiling of moderator is also evaluated. (Author).

26191 (INIS-mf–12758, pp. 591-595) **Atucha I nuclear power plant: Probabilistic safety study. Loss-of-coolant accidents.** Perez, S.S. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Ingenieria). Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The plant response to the group of events 'large coolant loss' in order to evaluate the associated risk is analyzed. The event that covers all events of similar sequence due to its evolution features, being also the most demanded, is selected as starting event. The representative event is the 'guillotine type rupture of cold primary branch'. An annual occurrence frequency of 10/year is assumed for this event. The safety systems, when the event occurs, must assure the reactor shutdown and the core cooling, creating a heat sink to remove the decay heat. The annual frequency of core meltdown due to great loss of coolant is obtained multiplying the annual frequency of the starting event by the probability of failure of involved safety systems. By means of failure trees, the following is obtained: (a) probability of failure to demand of the boron injection shutdown system = 4 x 10^{-2}; (b) probability of failure to demand of the high pressure safety injection = 3 x 10^{-3}; (c) probability of emergency cooling system failure = 4.4 x 10^{-2}. Therefore, the three possible sequences of core meltdown have the following frequencies: $\lambda_1 = 4 \times 10^{-6}$/year $\lambda_2 = 3 \times 10^{-7}$/year $\lambda_3 = 4.4 \times 10^{-6}$/year. (Author).

26192 (INIS-mf–12758, pp. 596-600) **CNE (Embalse nuclear power plant): Probabilistic safety study. Loss of steam generators as heat sink. Probabilistic evaluation and analysis through events sequence.** Lapadula, A.M. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Ingenieria). Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of this paper is to analyze and evaluate from a probabilistic point of view the consequences of a set of failure modes that can produce the loss of steam generators as heat sink. This work is part of a probabilistic study about the incidence of the secondary system on the power plant safety. The failure modes or starting events that are of interest in this study were previously identified. When the reactor is operating at full power, they are: (a) guillotine type rupture in drainage lines of steam generators; (b) severe rupture in downstream supply lines of regulating stations; (c) loss of main feeding flow associated with start up failure of auxiliary feeding system. The annual rate of occurrence of those failure modes is determined on the basis of the statistical values obtained from different sources of reliability data, using when necessary the failure-tree technique. The initial plant response, as well as the operator actions tending to create an alternative heat sink are analyzed through events sequence. It is concluded that the secondary system can seriously threaten the plant safety in two situations: loss of main feeding associated with failure of systems that reduce the reactor power and breakage of draining lines associated with omission failure of operator. (Author).

26193 (INIS-mf–12758, pp. 608-614) **Concept and structure of Instrumentation and control of the Atucha II nuclear power plant.** Garzon, D. (Empresa Nuclear Argentina de Centrales Electricas SA (ENACE), Buenos Aires (Argentina)); Roca, J.L. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The general structure of instrumentation and control of Atucha II nuclear power plant as well as the technologies used, are described: concepts of functional decentralization and physical centralization; concept of functional group and functional complex; description of the technologies used (physical support) in the project of plant instrumentation and control; description of the different automation levels on the basis of concepts of control interface, automatism, regulation, group and subgroup controls; principles of signal conditioning; concept of announcement of alarms and state: supervisory computer, description of HAS (Hard wired Alarm System) and CAS (Computer Alarm System); application of the above mentioned structure to the project of another type of plants. Source: OSTI; NTIS (US Sales Only); INIS.

The main results of ENEA (Italian Agency for Energy, New Technologies and the Environment) research activities, developed in collaboration with the General Electric Company, on oxide core optimization for the PRISM (Power Reactor, Innovative Small Module) advanced liquid metal reactor and on its characterization as an actinide burner are reported.

26195 (EUR–14605) **Codification of LMFBR rules and comparison of codes.** Faure, O. (Societe Franco-Americaine de Constructions Atomiques (FRAMATOME), 92 - Courbevoie (France)); Debaene, J.P. Commission of the European Communities, Luxembourg (Luxembourg). 1993. [75p.] Contract RA1-0138F. Source: OSTI; NTIS (US Sales Only); INIS.

The first part of this report presents the basic RCC-MR (regles de conception et de construction des materiels mecaniques des ilots nucleaires, reacteurs a neutrons rapides) design rules and their purpose. The second part is a qualitative comparison between RCC-MR, Code case N47 (ASME) and ETSDG Guide (MONJU Guide), made on the following topics: negligible creep test, ratcheting, creep fatigue, buckling, piping rules. An outline is given on improvements to RCC-MR rules now in progress.

26196 (FEI–2021) **Some problems of statistical analysis of the empirical data on reactor parameters.** Volkov, Yu.V.; Averin, L.V.; Chistozvonova, E.A.; Shejnkman, A.G. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1989. [11p.] (In Russian). Order Number DE93629726. Source: OSTI; NTIS (US Sales Only); INIS.

The article presents a method of interpreting repetitions in empirical data and a method for validating the assumptions of vacant digit positrons in empiric distribution for charts. The data from BN-600 reactor calculation printonts on margint for cladding maximum temperatures and specific linear loads on fuel elements are presented as an illustration of such applications. The determined peculiarities of empiric distributions of such parameters are explained. 2 refs.; 2 figs.

26197 (FEI–2031) **Evaluation of the boundary resonance effects in fast reactors by the first collision probability method.** Bezborodov, A.A.; Savos'kin, M.M.; Tsibulya, A.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1989. [20p.] (In Russian). Order Number DE93629727. Source: OSTI; NTIS (US Sales Only); INIS.

An efficient deterministic approach to the estimation of boundary resonance effects in fast breeder reactors is described, the approach is based on the method of probabilities of first collisions in subgroup representation and implemented in FFPR program. A number of fast breeder systems is investigated. The data are compared with the Monte Carlo method and point to a significant effect of fast boundary regions on criticality of ZPR-111-54 fuel assembly. The investigations of BN-1600 reactor model with heterogeneous core and annular feedstock insertions have revealed small boundary resonance effects and confirm the reliability of forecast of basic functionals derived in serial engineering design. The FF CPR program enables verification of traditional multigroup calculations for various classes of fast breeder reactors. 10 refs.; 6 figs.; 3 tabs.

26198 (FEI–2036) **Test model of high-power fast power reactor in hexagonal geometry: Description and calculational results.** Matveev, V.I.; Bobrov, S.B.; Zinin, A.I.; Ivanov, A.P.; Kolesov, V.E.; Pshakin, G.M.; Seregin, A.S. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1989. [36p.] (In Russian). Order Number DE93629728. Source: OSTI; NTIS (US Sales Only); INIS.

A 3D model of large-power fast breeder power reactor is described in hexagonal geometry. A number of problems is formulated for carrying out test calculations: determination of 'wave-up' enrichments under steady-state refuelling conditions; temperature and power variations; determinations of reactivity effects depending on fuel burnup; determination of control rod efficiency; investigation of energy release field distribution at non-design position of burnup compensators. For the purpose of solving this problems, a 2D model of the reactor is presented in (R,Z) geometry which has been derived from the 3D model through homogenization of certain regions. The results of calculating for this model are presented. The calculations were performed in 2D (R,Z) geometry and in 2D and 3D geometry with hexagonal grid in few-group approximation. 8 refs.; 5 figs.; 18 tabs.

26199 (FEI–2042) **Studying the temperature conditions using a double-circuit model of the fast reactor top chamber.** Opanasenko, A.N.; Romashin, B.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1989. [17p.] (In Russian). Order Number DE93629729. Source: OSTI; NTIS (US Sales Only); INIS.

The article presents the results of an experimental investigation of temperature fields using the model of the FBR upper chamber under different operating conditions. Temperature inhomogeneity in the upper chamber depends significant by on the conditions of coolant removal from the leads of fuel assemblies, and the number of operating loops of the secondary circuit. Temperature stratification of liquid occurs along the height of the chamber under transition to natural circulation. 3 refs.; 11 figs.

26200 (INIS-mf–13547, pp. 103-111) **Development and testing of UO_2-Cr dispersing full for fast reactor application.** Trefilov, V.I. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Zelenskij, V.F.; Ashikhmin, V.P. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

Data on creation of oxide dispersing fuel with chromium matrix are presented. Operating conditions of UO_2-Cr micro fuel element production and their consolidation into fuel cores were worked out. Proposed studies of corrosion resistance of cores in wide temperature range in water, vapour, oxygen, nitrogen gave positive results. Fuel tests in fuel elements of nuclear reactors showed reliable efficiency for fuel elements at deplation more than 10% h.a. 5 refs.; 4 figs.; 3 tabs. (author).

26201 (JAERI-M–93-062) **Application of H_∞ optimal estimator to reactivity estimation of fast breeder reactor.** Suzuki, Katsuo (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Shimazaki, Junya. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 33p. (In Japanese). Order Number DE93508334. Source: OSTI; NTIS; INIS.

In this report a reactivity estimator for a fast breeder reactor is designed using the design method based on H_∞ optimal estimation theory and the estimation results are shown. The H_∞ optimal estimation theory is formulated as a minimax problem where the maximum 'energy' of estimation error over all disturbance trajectories in L_2 functional space is minimized in the sense of H_∞-norm. In the design was used a system model which consists of usual point reactor kinetics equations combined with a state equation of net reactivity driven by fictitious noise/disturbance. Finally, we show by computer simulation that H_∞ estimator gives good results in estimating net reactivity changes caused by various disturbances. (author).

DC (United States). DOE Contract AC02-76CH00016. (CONF-930103–37: 10. symposium on space nuclear power and propulsion, Albuquerque, NM (United States), 10-14 Jan 1993). Order Number DE93013148. Source: OSTI; NTIS; INIS; GPO Dep.

The scattering kernel data for ^{7}LiH have been generated for the first time in the temperature range 50–1000 K. This is based on a phonon distribution function derived from both experimental data and theoretical calculations. A detailed study of the variation of the moderator temperature coefficient $\alpha_m(T)$ with temperature, T, is carried out for a typical space nuclear reactor of the particle bed type. It is established that the moderator temperature coefficient due to chemical binding effects follows the relationship $\alpha_m(T) = C F_v(H)^{1.6}$ where $F_v(H)$ is the volume fraction of bound solid hydrogen and C is a normalization constant which depends on the moderator capture thermal cross section. The value 1.65 is to be compared with 1.54 ± 0.06 derived in a previous study where water scattering kernels are applied. For control and safety reasons, a minimization of this positive component temperature coefficient can be most effective by operating the moderator at high temperatures. Advantages of this approach are outlined. In addition, suggestions are made to render the overall temperature coefficient negative.

26203 (BNL–48562) **A particle bed reactor based NTP in the 112,500 N thrust class.** Ludewig, H.; Powell, J.R.; Lazareth, O.W. Jr.; Todosow, M. Brookhaven National Lab., Upton, NY (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. This paper discusses the application of a Particle bed Reactor (PBR) to a 112,500 N thrust Nuclear Thermal Propulsion (NTP) Engine. The method of analysis is described, followed by a presentation of the results. It is concluded that the PBR would result in a very competitive NTP engine. In addition, due to the high power densities possible with a PBR, high thrust/weight ratios are possible. This conclusion can be used to satisfy a variety of mission goals.

26204 (BNL–48667) **Nuclear Thermal Propulsion engine based on Particle Bed Reactor using light water steam as a propellant.** Powell, J.R.; Ludewig, H.; Maise, G. Brookhaven National Lab., Upton, NY (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930103–40: 10. symposium on space nuclear power and propulsion, Albuquerque, NM (United States), 10-14 Jan 1993). Order Number DE93014336. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In this paper the possibility of configuring a water cooled Nuclear Thermal Propulsion (NTP) rocket, based on a Particle Bed Reactor (PBR) is investigated. This rocket will be used to operate on water obtained from near earth objects. The conclusions reached in this paper indicate that it is possible to configure a PBR based NTP rocket to operate on water and meet the mission requirements envisioned for it. No insurmountable technology issues have been identified.

Benchmark analyses have been performed of Particle Bed Reactor (PBR) critical experiments (CX) using the MCNP radiation transport code. The experiments have been conducted at the Sandia National Laboratory reactor facility in support of the Space Nuclear Thermal Propulsion (SNTP) program. The test reactor is a nineteen element water moderated and reflected thermal system. A series of integral experiments have been carried out to test the capabilities of the radiation transport codes to predict the performance of PBR systems. MCNP was selected as the preferred radiation analysis tool for the benchmark experiments. Comparison between experimental and calculational results indicate very good agreement. This paper describes the analyses of benchmark experiments designed to quantify the accuracy of the MCNP radiation transport code for predicting the performance characteristics of PBR reactors.

26206 (BNL–48700) **Space reactor fuel element testing in upgraded TREAT.** Todosow, M.; Bezler, P.; Ludewig, H.; Kato, W.Y. Brookhaven National Lab., Upton, NY (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930103–36: 10. symposium on space nuclear power and propulsion, Albuquerque, NM (United States), 10-14 Jan 1993). Order Number DE93012524. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The testing of candidate fuel elements at prototypic operating conditions with respect to temperature, power density, hydrogen coolant flow rate, etc., a crucial component in the development and qualification of nuclear rocket engines based on the Particle Bed Reactor (PBR), NERVA-derivative, and other concepts. Such testing may be performed at existing reactors, or at new facilities. A scoping study has been performed to assess the feasibility of testing PBR based fuel elements at the TREAT reactor. initial results suggest that full-scale PBR, elements could be tested at an average energy deposition of ~60–80 MW-s/L in the current TREAT reactor. If the TREAT reactor was upgraded to include fuel elements with a higher temperature limit, average energy deposition of ~100 MW/L may be achievable.

The aim of work on the Rover program at the Los Alamos Scientific Laboratory (LASL, now Los Alamos National Laboratory) beginning in 1955 was the development of a nuclear propulsion rocket engine consisting of a core with many holes in it through which hydrogen at high pressure passed and was heated to high temperature for discharge through a nozzle. A number of generations of graphite based fuel elements were developed. Work was initiated in the late 1960s to explore the potential for longer fuel element life and higher temperature operation by basing the fuel structure on (U, Zr) C. The performance of a small number of such fuel elements in the last reactor tested was good enough that it was decided that (U, Zr)C fuel would be used in the next reactor. Manufacture of these elements was well underway when the Rover program was canceled in January of 1973.

26208 (WHC-SA–1420) **Thulium heat sources for space power applications.** Alderman, C.J. Westinghouse Hanford Co., Richland, WA (United States). May 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-920803–18: Nuclear technologies for space exploration, Jackson, WY (United States), 16-19 Aug 1992). Order Number DE93014145. Source: OSTI; NTIS; INIS; GPO Dep.

Reliable power supplies for use in transportation and remote systems will be an important part of space exploration terrestrial activities. A potential power source is available in the rare earth metal, thulium. Fuel sources can be produced by activating Tm-169 targets in the space station reactor. The resulting Tm-170 heat sources can be used in thermoelectric generators to power instrumentation and telecommunications located at remote sites such as weather stations. As the heat source in a dynamic Sterling or Brayton cycle system, the heat source can provide a lightweight power source for rovers or other terrestrial transportation systems.

26209 (WSRC-TR–92-134) **Data qualification summary for 1985 L-Area AC Flow Tests.** Edwards, T.B.; Eghbali, D.A.; Liebmann, M.L.; Shine, E.P. Westinghouse Savannah River Co., Aiken,

SC (United States). Mar 1992. 124p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93015826. Source: OSTI; NTIS; INIS; GPO Dep.

The 1985 L-Area AC Flow Tests were conducted to provide an extended data base for upgrading the reactor system models employed in predicting normal process water flows. This report summarizes the results of the recently completed, formal, technical review of the data from the 1985 L-Area AC Flow Tests as detailed in document SCS-CMAS-910045. The purpose of that review was to provide corroborating technical information as to the quality (fitness for use) of these experimental data. Reference [1] required three volumes to fully document the results of that Data Qualification process. This report has been prepared to provide the important conclusions from that process in a manageable and understandable format. Consult reference [1] if any additional information or detail is needed. This report provides highlights from that study: an overview of the tests and data, a description of the instrumentation used, an explanation of the data qualification methods employed to review the data, and the important conclusions reached from the study. Reference 1: Edwards, T.B., D.A. Eghbali, M.L. Liebmann, and E.P. Shine, "Data Qualification for 1985 L-Area AC Flow Tests," SCS-CMAS-910045, December 31, 1991.

In Peru, the Regulation for Ionizing Radiation Sources is applied, which establishes the norms and procedures to follow in the nuclear and radioactive installations of the country in order to assure their correct operation as concerns to the nuclear safety and radiological protection, allowing the emission of the respective licenses. As for the nuclear facilities, this authorization includes the Previous License, the Construction License and the Operation License (provisional and definitive) and for radioactive facilities and equipment generating ionizing radiations: the Construction License and the Operation License. The personnel also require a license that can be an operator license (as for nuclear reactors) or a supervisor license (for nuclear and radioactive facilities). In spite of the above mentioned regulation and its long enforcement period, less than 10% of radioactive facilities in this country are licensed, due to different problems which will be solved in the medium term. (Author).

This document is a monthly publication containing descriptions of information received and generated by the US Nuclear Regulatory Commission (NRC). This information includes (1) docketed material associated with civilian nuclear power plants and other uses of radioactive materials, and (2) nondocketed material received and generated by NRC pertinent to its role as a regulatory agency. The following indexes are included: Personal Author, Corporate Source, Report Number, and Cross Reference of Enclosures to Principal Documents.

26215 (NUREG–0940-Vol.12-No.1) **Enforcement actions: Significant actions resolved: Quarterly progress report, January–March 1993: Volume 12, No. 1.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Enforcement. Jun 1993. 455p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

This compilation summarizes significant enforcement actions that have been resolved during one quarterly period (January–March 1993) and includes copies of letters, Notices, and Orders sent by the Nuclear Regulatory Commission to licensees with respect to these enforcement actions. It is anticipated that the information in this publication will be widely disseminated to managers and employees engaged in activities licensed by the NRC, so that actions can be taken to improve safety by avoiding future violations similar to those described in this publication.

26216 (NUREG/CR–5955) **Materials and design bases issues in ASME Code Case N-47.** Huddleston, R.L. (Oak Ridge National Lab., TN (United States)); Swindeman, R.W. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Oak Ridge National Lab., TN (United States). Apr 1993. 34p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/TM–12266). Source: OSTI; NTIS; INIS; GPO.

A preliminary evaluation of the design bases (principally ASME Code Case N-47) was conducted for design and operation of reactors at elevated temperatures where the time-dependent effects of creep, creep-fatigue, and creep ratcheting are significant. Areas where Code rules or regulatory guides may be lacking or inadequate to ensure the operation over the expected life cycles for the next-generation advanced high-temperature reactor systems, with designs to be certified by the US Nuclear Regulatory Commission, have been identified as unresolved issues. Twenty-two unresolved issues were identified and brief scoping plans developed for resolving these issues.

26217 (EUR–14043/6) **Assessment of management alternatives for LWR wastes. Volume 6. Cost determination of the LWR waste management routes (treatment/conditioning/packaging/transport operations).** Thiels, G.M. (Task R and S, Ispra (Italy)); Kowa, S. Commission of the European Communities, Luxembourg (Luxembourg). 1993. [65p.] Contract FI1W/0125-C. Source: OSTI; NTIS (US Sales Only); INIS.

This report deals with the cost determination of a number of schemes for the treatment, conditioning, packaging, interim storage and transport operations of LWR wastes drawn up on the basis of Belgian, French and German practices in this particular area. In addition to the general procedure elaborated for determining, actualizing and scaling of plant and transport costs associated with the various schemes, in-depth calculations of each intermediate management stage are included in this report. This study is part of an overall theoretical exercise aimed at evaluating a selection of management routes for LWR waste based on economical and radiological criteria.

26218 (INIS-GB–481) **Nuclear Electric: the misuse of the subsidy and the case for the immediate closure of Magnox.** Greenpeace, London (United Kingdom). Nov 1992. [9p.] Order Number DE93631647. Source: OSTI; NTIS (US Sales Only); INIS.

The nature and purpose of fossil fuel levy which creates a subsidy for the nuclear industry is discussed. It is claimed that without the subsidy the operation of Magnox and AGR stations generates electricity at a loss. This means that most of the fossil fuel levy is being used to make up Nuclear Electric's losses. The rest is mostly being used to build the Sizewell-B power plant. This is in contrast to the popular belief and understanding that the subsidy is for decommissioning old plants, and cleaning up accumulated spent fuels and other wastes. The economics of the Magnox stations are discussed and Nuclear Electric's claim that closing them would not stop the losses is challenged. (U.K.).

26219 (INIS-mf–13566) **Energy operations policy.** European Bank for Reconstruction and Development, London (United Kingdom). [1993]. [38p.] Order Number DE93631644. Source: OSTI; NTIS (US Sales Only); INIS.

It is reported that energy policy was designed following the European Bank for Reconstruction and Development review of the most pressing energy issues confronting Central and Eastern Europe and the republics of the former Soviet Union. The main features of the policy described in the document set the general framework for the Bank's energy operations. Energy strategies for particular countries are designed as an integral part of the Bank's individual country strategies. Tabs.

26220 (SR/H–540) **[Hanford Department histories]: Accounting Department, Part 2.** [Plant histories]. Hanford Engineer Works, Richland, WA (United States). [1946]. 123p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. Order Number DE93013441. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Stores activities at Hanford have been fundamentally the same as at other du Pont-operated war plants, involving primarily the requisitioning, receiving, warehousing, and dispensing of materials essential to plant operation and maintenance (except basic raw materials). In addition, Stores have been responsible for the shipment of outgoing materials, and the handling of excess materials. These functions have been complicated by the great distances between the various plant areas, and Richland. This document reviews Stores and accounting experience from its inception in December 1943 to July 1, 1945.

26221 (ANL/NPR–92/17) **DIF3D-K: A nodal kinetics code for solving the time-dependent diffusion equation in hexagonal-Z geometry: New Production Reactors Program.** Taiwo, T.A. Argonne National Lab., IL (United States). Oct 1992. 317p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93010996. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The development of a three-dimensional, space- and energy-dependent neutron kinetics capability for hexagonal-Z geometry calculations is described. The code employs a nodal method derived using polynomial approximations to the spatial dependence of the flux within each hexagonal prism node for spatial discretization. The resulting time-dependent nodal equations for the neutron flux and precursor concentration moments are solved using one of two major solution methods, the theta method or the space-tune factorization methods (improved quasi-static, adiabatic, or conventional point kinetics). This report describes the derivation of the time-dependent nodal equations, along with the theta method and the space-time factorization methods available for solving them. The report also provides user application and program implementation information. The user information section provides descriptions of the input data, instructions for executing the code, description of the code output, and summary of code limitations. Sample problem input and output are also provided. A description is given of the code structure (code flow and descriptions of code segments), and instructions are provided for implementing the code on Cray-UNICOS computers and UNIX-based workstations. Information is also provided on implementing DIF3D-K as a neutron kinetics module within an integrated dynamics code.

26222 (INIS-mf–12758, pp. 109-119) **Point kinetics improvements to evaluate three-dimensional effects in transients calculation.** Castellotti, U. (Empresa Nuclear Argentina de Centrales Electricas SA (ENACE), Buenos Aires (Argentina)). Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

A calculation method, which considers the flux axial perturbations in the parameters related to the reactivity within a point kinetics model, is described. The method considered uses axial factors of consideration which act on the thermohydraulic variables included in the reactivity calculation. The PUMA three-dimensional code as reference model for the comparisons, is used. The limitations inherent to the reactivity balance of the point models used in the transients calculation, are given. (Author).

26223 (WSRC-TR–91-499) **Verification and validation action matrix summary for AXLIB4.** Le, T.T. Westinghouse Savannah River Co., Aiken, SC (United States). Aug 1991. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014726. Source: OSTI; NTIS; GPO Dep.

This document identifies the work performed and documentation generated to satisfy action items for the Reactor Physics computer code AXLIB4. Each action item is discussed with the justification for its completion. Specific details of the work performed are not included in this document but are found in references. The validation and verification effort for the AXLIB4 code is completed.

Finite Element Method has been a very popular numerical technique for the stress analysis of structures. One of the major areas that is being addressed in the last two decades in Finite Element Technique, is nonlinear analysis. The application of nonlinear analysis is increasingly felt in analysing components of nuclear reactors, aerospace structures, metal forming processes, etc. Nuclear reactor components such as fuel bundles, coolant channels, seal discs, end fittings require such analysis. A finite element code for thermal viscoplastic analysis of two dimensional structures has been developed. The code is tested against a number of sample problems. Two real life problems are solved using this code, namely creep analysis of sheath of nuclear fuel pin and creep analysis of a pressure vessel. The present report gives the details of the code and the problems solved using this code. (author). 7 refs., figs., 1 appendix.

26225 (DOE/ER/45461–11) **The deterministic prediction of failure of low pressure steam turbine disks.** Liu, Chun; Macdonald, D.D. Pennsylvania State Univ., University Park, PA (United States). Center for Advanced Materials. [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER45461. (CONF-930998–2: Fall committee week of the National Association of Corrosion Engineers, Houston, TX (United States), 26 Sep - 1 oct 1993). Order Number DE93012922. Source: OSTI; NTIS; INIS; GPO Dep.

Localized corrosion phenomena, including pitting corrosion, stress corrosion cracking, and corrosion fatigue, are the principal causes of corrosion-induced damage in electric power generating facilities and typically result in more than 50% of the unscheduled outages. Prediction of damage, so that repairs and inspections can be made during scheduled outages, could have an enormous impact on the economics of electric power generation. To date, prediction of corrosion damage has been made on the basis of empirical/statistical methods that have proven to be insufficiently robust and accurate to form the basis for the desired inspection/repair protocol. In this paper, we describe a deterministic method for predicting localized corrosion damage. We have used the method to illustrate how pitting corrosion initiates stress corrosion cracking (SCC) for low pressure steam turbine disks downstream of the Wilson line, where a thin condensed liquid layer exists on the steel disk surfaces. Our calculations show that the SCC initiation and propagation are sensitive to the oxygen content of the steam, the environment in the thin liquid condensed layer, and the stresses that the disk experiences in service.

Our calculations show that the SCC initiation and propagation are sensitive to the oxygen content of the steam, the environment in the thin liquid condensed layer, and the stresses that the disk experiences in service.

26227 (DOE/ER/45461–21) **Modeling the corrosion behaviors of the heat transport circuits of light water nuclear reactors.** Bertuch, A. (Pennsylvania State Univ., University Park, PA (United States). Center for Advanced Materials); Macdonald, D.D.; Pang, J.; Kriksunov, L.; Arioka, K. Pennsylvania State Univ., University Park, PA (United States). Center for Advanced Materials. [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER45461. (CONF-930825–1: 6. international symposium on environmental degradation of materials in nuclear power systems: water reactors, San Diego, CA (United States), 3-5 Aug 1993). Order Number DE93015033. Source: OSTI; NTIS; INIS; GPO Dep.

To model the corrosion behaviors of the heat transport circuits of light water reactors, a mixed potential model (MPM) has been developed and applied to both boiling water reactors (BWRS) and pressurized water reactors (PWRs). Using the data generated by the GE/UKEA-Harwell radiolysis model, electrochemical potentials (ECPs) have been calculated for the heat transport circuits of eight BWRs operating under hydrogen water chemistry (HWC). By modeling the corrosion behaviors of these reactors, the effectiveness of HWC at limiting IGSCC and IASCC can be determined. For simulating PWR primary circuits, a chemical-radiolysis model (developed by the authors) was used to generate input parameters for the NWM. Corrosion potentials of Type 304 and 316 SSs in PWR primary environments were calculated using the NWM and were found to be in good agreement with the corrosion potentials measured in the laboratory for simulated PWR primary environments.

26228 (EGG-M–92703) **Modeling of a horizontal steam generator for the submerged nuclear power station concept.** Palmrose, D.E.; Herring, J.S. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-930778–2: 1993 RELAP5 international users meeting, Boston, MA (United States), 6-9 Jul 1993). Order Number DE93013665. Source: OSTI; NTIS; INIS; GPO Dep.

A submerged nuclear power station has been proposed as an alternative power station with a relatively low environmental impact for use by both industrialized and developing countries. The station would be placed 10 m above the seabed at a depth of 30–100 m and a distance of 10–30 km from shore. The submerged nuclear power station would be manufactured and refueled in a central facility, thus gaining the economies of factoryfabrication and the flexibility of short-lead-time deployment. To minimize the size of the submerged hull, horizontal steam generators are proposed for the primary-to-secondary heat transfer, instead of the more traditional vertical steam generators. The horizontal steam generators for SNPS would be similar in design to the horizontal steam generators used in the N-Reactors except the tube orientation is horizontal (the tube's inlet and outlet connection points on the tubesheet are at the same elevation). Previous RELAP5 input decks for horizontal steam generators have been either very simplistic (Loviisa PWR) or used a vertical tube orientation (N-Reactor). This paper will present the development and testing of a RELAP5 horizontal steam generator model, complete with a simple secondary water level control system, that accounts for the dynamic flow conditions which exist inside horizontal steam generators.

26229 (ETDE-IT–93-187) **Investigation on stress indices C3, K3, C'3 for gross structural discontinuities of piping systems.** Milella, P.P.; Pino, G.; Ronchi, U.; Capello, R.; Orlandi, S.; Zanaboni, P. ENEA, Rome (Italy). Direzione Sicurezza Nazionale e Protezione Sanitaria; ENEA, Bologna (Italy); Ansaldo SpA, Genoa (Italy). 1992. 7p. (CONF-921003–12: International conference on design and safety of advanced nuclear power plants, Tokyo (Japan), 25-28 Oct 1992). Order Number DE93799274. Source: OSTI; NTIS (US Sales Only); INIS.

The paper presents the first results of a research activity promoted in Italy by ENEA (Italian Agency for Energy, New Technologies and the Environment) and carried out in the framework of the ENEA-ANSALDO consortium, GENESI, aimed at assessing the aging of gross discontinuities such as reducers, transitions and penetrations subjected to severe thermal transients such as those produced by the sudden admittance of steam (or hot water) into piping at ambient temperature, which ran result in low cycle fatigue failure. In particular, the paper addresses the problem of design by rule, as per ASME NB 3600, where stress indices, or intensification factors (SIF) are needed and full-scale testing is mandatory to validate them. Here SIF's are derived through refined 2D-3D finite elements analysis for 20 different geometries, only 9 of which were covered by the ASME Code, the others being without any available SIF. Results indicate that the ASME factors are not always conservative and, that an integrated approach to the problem is required were SIF's evaluated by calculations must be checked on full scale structures and non-destructive examination procedures applied to demonstrate the capability to detect the early appearance of a tiny crack produced by thermal stresses in complex geometries.

26230 (FEI–2009) **Experimental study into stratified coolant flow in power plant elements.** Opanasenko, A.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1989. [12p.] (In Russian). Order Number DE93629673. Source: OSTI; NTIS (US Sales Only); INIS.

The article presents the results of investigations into temperature field and coolant flow structures using the models of mixing chambers, pipelines, annular gaps of vessel-type reactors under stationary and dynamic operation conditions. The results of experimental investigation of coolant temperature stratification using the models of the FBR upper mixing chamber, pipeline and annular gap of WWER-type reactor are given. Frude critical number is determined for occurrence of temperature stratification in pipelines, and dependences are derived for calculating the height of cold liquid jet penetration in a warmer medium and hot liquid wedge length in pipelines. The investigation results show that stratification changes drastically the dynamics and structure of thermohydraulic processes. Time and space scales of different types of secondary flows, their stability are related to averaged flow characteristics and flow microstructure as well. 5 refs.; 6 figs.

26231 (FEI–2015) **Turbulent interchannel momentum exchange in reactor fuel assemblies.** Zhukov, A.V.; Sorokin, A.P.; Titov, P.A.; Ushakov, P.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1989. [21p.] (In Russian). Order Number DE93629674. Source: OSTI; NTIS (US Sales Only); INIS.

A method is proposed for processing the results of experimental hydrodynamic investigations to determine the values of coefficients of momentum interchannel exchange through the mechanism of turbulent exchange in smooth rod bunches; the results of experimental data processing are presented. The obtained data are compared with the results produced by the flare method. The calculated ratio for coefficient of momentum interchannel exchange in smooth rod bunches is derived on the basis of the assumptions about substance exchange. 26 refs.; 4 figs.; 2 tabs.

26232 (IAEA-TECDOC–700, pp. 57-62) **ROMADIS - A rotating machinery diagnosis system.** Ding, Y. (Gesellschaft fuer Anlagen- und Reaktorsicherheit mbH, Garching (Germany)). International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9209356–: Specialists meeting/workshop on the potential of knowledge based systems in nuclear installations, Erlangen (Germany), 21-25 Sep 1992). In *The potential of knowledge based systems in nuclear installations: Report of a specialists' meeting/workshop held in Erlangen, Germany, 21-25 September 1992.* [97p.] Order Number DE93629675. Source: OSTI; NTIS (US Sales Only); INIS.

This paper describes the PC-based software package ROMADIS developed for the rotating machinery diagnosis. It contains advanced signal processing techniques for extracting multi-features from the time records and uses a modified decision tree technique for the knowledge acquisition, the knowledge representation and the failure diagnosis process. It is user-friendly programmed and the diagnostic results are very easy to be verified. (author). 5 refs, 3 figs.

26233 (INIS-mf–12758, pp. 15-16) **'Crud' detection and evaluation during the Embalse nuclear power plant's thermal cycle for powers of 100%.** Fernandez, A. (Comision Nacional de Energia Atomica, Embalse (Argentina). Central Nuclear en Embalse); Rosales, A.H.; Mura, V.R.; Sentupery, C.; Rascon, H. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

This paper describes the 'crud' measurements performed during the Embalse nuclear power plant's thermal cycle for a power of 100% (645 MWe) under different purification conditions. The aim of this work is to optimize the four steam generators' tube plate cleaning in function of the sweeping produced by their purification. (Author).

26234 (INIS-mf–12758, pp. 33-38) **Mechanical damage and corrosion in the primary system purification cooler.** Sainz, R.A. (Investigacion Aplicada SE (INVAP), San Carlos de Bariloche (Argentina)); Fiorini, R.H.; Semino, C.J. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

Through the routine measurements of tritium activity and isotopic content in the exchanger's cooling water, a loss of heavy water was detected. During the decommissioning programmed for October 1986, the equipment was dismantled and the tubes losses were identified through helium fugue tests; subsequently, a 100% inspection of the tubes by atmospheric currents were performed, verifying reductions exceeding 50% of the original width in 70 tubes of the first section at the top plate level. These indications were verified through the study of the two extracted tubes, one of them observing a passing failure where marks appeared at all levels of the support and corrosion plates through splits at the top plates level. The corrosion causes were due to the low cooling flow which results from the primary system's reduction regarding the purification flow design, thus permitting the deposits accumulation. (Author).

26235 (INIS-mf–12758, pp. 63-66) **Development and production of nuclear valves. Forging and welding. Pt. 2.** Bernal Castro, J.B. (Metalurgica Bellucci SA, Lanus (Argentina)); Perez, J.C.; Labonia, R.N. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The first part of this work deals with the obtainment of the austenitic stainless steel DIN 1.4541 (AISI 321) stabilized titanium for Atucha II nuclear valves. The second part presented herein, continued with the development process and part of the production of the bodies' forging and valves leads. This development has been also carried out in the country and a detailed set up of the process with its corresponding Inspection and Assay Program was needed. The last part of this stage has been initiated at the welding process, so it was necessary to develop specific welding procedures to qualify them and use the equipment specially applied to this requirement. The set of assays and criteria certification for the qualifications is presented. (Author).

26236 (INIS-mf–12758, pp. 159-163) **Modal analysis application for dynamic characterization of simple structures.** Pastorini, A.J. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Desarrollo); Belinco, C.G.; Zubiaga,

J. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The knowledge of the dynamic characteristics of a structure helps to foresee the vibrating behaviour under operating conditions. The modal analysis techniques offer a method to perform the dynamic characterization of a studied structure from the vibration modes of such structure. A hammer provided with a loaded cell to excite a wide frequency band and accelerometer and, on the basis of a measurement of the transfer function at different points, various simple structures were given with a dynamic structures analysis (of the type of Fourier's rapidly transformation) and the results were compared with those obtained by other methods. Different fields where these techniques are applied, are also enumerated. (Author).

26237 (INIS-mf–12758, pp. 164-170) **Tensions and displacements calculation produced by a welding process in a nuclear power plant steam generator entrance by the finite element method.** Sanzi, H.C. (Empresa Nuclear Argentina de Centrales Electricas SA (ENACE), Buenos Aires (Argentina)). Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

This paper presents the results obtained from the tensions state and the displacements field of thermal origin, generated by a caloric source during the welding process. All the surfaces in contact with heavy water in a PHWR plant (Reactor of Pressurized Heavy Water) must be of austenitic stainless steel according to standard DIN 1.4550 or must be internally covered with this material. In the case of the primary loop components, -as the steam generator-, the walls of ferritic steel are covered with an austenitic stainless steel cladding. This cladding is applied by the welding process of immersed arc. Special attention is given during calculation, on the deformation produced in the holes of the bolts that link the entrance with the external lead. The distribution of nodal temperatures, as a function of time, is determined by a two-dimensional finite elements model during the welding process and the tension state and the displacement, by means of computational programs, were afterwards calculated. (Author).

26238 (KTM/E-B–124) **RATU - Nuclear power plant structural safety: Evaluation of research programme 1990-1992.** Hedner, G. (Statens kaernkraftsinspektion, Stockholm (Sweden)); Schultz, H.; Unneberg, L. Ministry of Trade and Industry, Helsinki (Finland). Energy Dept. Dec 1992. [30p.] Order Number DE93629676. Source: OSTI; NTIS; INIS.

Finland's energy research programmes.

The evaluation group is of the opinion that the work performed under the RATU programme is generally of high quality, in some areas, especially those related to water chemistry of excellent quality. The personnel gives the impression of being dedicated and enthusiastic, and the administration seems to be very effective. It is obvious that the RATU programme has taken advantage of related contracts and projects funded by different sources. It is the opinion of the valuation group that the investment and human capital have been brought to work very efficiently in all projects. The objectives of the programme and the different projects are formulated in a broad sense. The areas selected for work are however of high relevance to nuclear safety. In some projects not all aspects are addressed by the ongoing work, and further activities may be necessary to meet with the requirements of the authorities. (orig.).

26239 (LA-UR–93-1980) **Computational problems with the binomial failure rate model and incomplete common cause failure reliability data.** Kvam, P.H. Los Alamos National Lab., NM (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9304154–1: Interface computing science and statistics, San Diego, CA (United States), 14-17 Apr 1993). Order Number DE93014346. Source: OSTI; NTIS; GPO Dep.

In estimating the reliability of a system of components, it is ordinarily assumed that the component lifetimes are independently distributed. This assumption usually alleviates the difficulty of analyzing complex systems, but it is seldom true that the failure of one component in an interactive system has no effect on the lifetimes of the other components. Often, two or more components will fail simultaneously due to a common cause event. Such an incident is called a common cause failure (CCF), and is now recognized as an important contribution to system failure in various applications of reliability. We examine current methods for reliability estimation of system and component lifetimes using estimators derived from the binomial failure rate model. Computational problems require a new approach, like iterative solutions via the EM algorithm.

26240 (NUREG/CR–4599-Vol.2-No.2) **Short Cracks in Piping and Piping Welds: Semiannual report, October 1991–March 1992: Volume 2, No. 2.** Wilkowski, G.M. (Battelle, Columbus, OH (United States)); Brust, F.; Francini, R.; Ghadiali, N.; Kilinski, T.; Krishnaswamy, P.; Landow, M.; Marschall, C.W.; Rahman, S.; Scott, P. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Battelle, Columbus, OH (United States). May 1993. 121p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (BMI–2173-Vol.2-No.2). Source: OSTI; NTIS; INIS; GPO.

This is the fourth semiannual report of the US Nuclear Regulatory Commission's Short Cracks in Piping and Piping Welds research program. This 4-Year program began in March 1990. The overall objective of this program is to verify and improve fracture analyses for circumferentially cracked large-diameter nuclear piping with crack sizes typically used in leak-before-break analyses or inservice flaw evaluations. Progress during this reporting period involved: (1) completing two through-wall-cracked pipe experiments and supplementary material property data, (2) an internal circumferential surface-cracked pipe experiment was completed which showed that the R/t effects on the Net-Section-Collapse Predicted loads for surface-cracked pipe to be independent of crack size, (3) the anisotropy investigation showed that pipe dimensions may be as important in determining the out-of-plane crack growth angle as the anisotropy of the toughness, (4) we initiated a probabilistic analysis of LBB to assess the potential changes in the leakage detection criteria in NRC Reg Guide 1.45, and (5) other efforts involved a sensitivity study on the effect of thermal aging of cast stainless steel on the moment-carrying capacity of the pipe as a function of time.

26241 (NUREG/CR–5410) **Statistically based reevaluation of PISC-II round robin test data.** Heasler, P.G. (Pacific Northwest Lab., Richland, WA (United States)); Taylor, T.T.; Doctor, S.R. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Pacific Northwest Lab., Richland, WA (United States). May 1993. 164p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC06-76RL01830. (PNL–8577). Source: OSTI; NTIS; INIS; GPO.

This report presents a re-analysis of an international PISC-II (Programme for Inspection of Steel Components, Phase 2) round-robin inspection results using formal statistical techniques to account for experimental error. The analysis examines US team performance vs. other participants performance,flaw sizing performance and errors associated with flaw sizing, factors influencing flaw detection probability, performance of all participants with respect to recently adopted ASME Section 11 flaw detection performance demonstration requirements, and develops conclusions concerning ultrasonic inspection capability. Inspection data were gathered on four heavy section steel components which included two plates and two nozzle configurations.

26242 (NUREG/CR–6031) **Cavitation guide for control valves.** Tullis, J.P. (Tullis Engineering Consultants, Logan, UT (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Tullis Engineering Consultants, Logan, UT (United States). Apr 1993. 115p. Sponsored by

Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

This guide teaches the basic fundamentals of cavitation to provide the reader with an understanding of what causes cavitation, when it occurs, and the potential problems cavitation can cause to a valve and piping system. The document provides guidelines for understanding how to reduce the cavitation and/or select control valves for a cavitating system. The guide provides a method for predicting the cavitation intensity of control valves, and how the effect of cavitation on a system will vary with valve type, valve function, valve size, operating pressure, duration of operation and details of the piping installation. The guide defines six cavitation limits identifying cavitation intensities ranging from inception to the maximum intensity possible. The intensity of the cavitation at each limit Is described, including a brief discussion of how each level of cavitation influences the valve and system. Examples are included to demonstrate how to apply the method, including making both size and pressure scale effects corrections. Methods of controlling cavitation are discussed providing information on various techniques which can be used to design a new system or modify an existing one so it can operate at a desired level of cavitation.

26243 (ORNL/FTR–4204) **[Life Management of Nuclear Power Plants]: Foreign trip report, February 15–22, 1992.** Pugh, C.E. Oak Ridge National Lab., TN (United States). 6 Mar 1992. 23p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011109. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses travel to attend the regular meeting of the IAEA IWG-LMNPP. This working group is part of the Nuclear Power Division and is primarily concerned with the integrity of primary and secondary systems f light-water reactor power plants. Historically, a special emphasis has been placed on pressure vessel integrity and the influence of neutron radiation. Reports were made by the representatives from each country and organization. The IAEA scientific secretary reported on the specialists' meetings held since the last IWG meeting (March 1990). The calendar of future meetings was identified firmly through 1993 and tentatively through 1995. (The United States will host one specialists' meeting in October 1992.) The traveler's report summarized activities in the US with an emphasis on license renewal. The traveler met with H. Schulz and J. Sievers of GRS to discuss plans for the October specialists' meeting, which is to be held in Oak Ridge and cosponsored by the Fracture Assessment Group (FAG) of the OECD's Committee on Safety of Nuclear Installations (CSNI). Dr. Schulz is Chairman of CSNI/FAG.

26244 (ORNL/FTR–4292) **The collaborative US/Japanese irradiation-effects investigations on material that has been removed from the pressure vessel of the Japanese Power Demonstration Reactor (JPDR): Foreign trip report, May 17–23, 1992.** Corwin, W.R.; Mayfield, M.E. Oak Ridge National Lab., TN (United States). 22 Jun 1992. 16p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011074. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The travelers participated in three site visits, in order to investigate research on integrity of light-water reactor (LWR) pressure vessels. Discussions were held with personnel JAERI about collaborative US-Japanese studies of irradiation effects on material removed from the JPDR. Tentative agreement was reached to provide JPDR vessel pieces to the ORNL for examination of changes in microstructural and fracture properties. The studies at ORNL, to be conducted as part of the Heavy-Section Steel Irradiation (HSSI) Program will complement ongoing studies being conducted by JAERI. Presentations were made to the JAERI staff by W.R. Corwin on results of international assessment of large-scale fracture experiments conducted by the Fracture Assessment Group and M.E. Mayfield on shutdown of Yankee Rowe. During the visit to University of Tokyo, the status of the recent year's and the plans for the next year's work within the EPI Program were presented by the Japanese. The EPI Program is partially funded by the NRC through participation by ORNL. At the meeting with CRIEPI, results from the NRC-coordinated roundrobin on probabilistic failure analysis for pressurized thermal shock were presented by M.E. Mayfield, and discussions were held regarding the level of agreement of calculations performed by CRIEPI participants.

26245 (FEI–2006) **Studying in the fuel-coolant interaction when simulating its return to the accidental package cavity.** Masagutov, R.F.; Kharitonov, S.R.; Kozlov, F.A.; Zagorul'ko, Yu.I.; Rogova, N.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1989. [11p.] (In Russian). Order Number DE93629679. Source: OSTI; NTIS (US Sales Only); INIS.

The article presents the results of investigations into dynamic characteristics of bismuth melt-water interaction when simulating accidents at nuclear reactors with core materials melting and their subsequent interaction with coolant. The simulation of accident interaction was performed at a vertical faility consisting of a water-filled interaction chamber and melting chamber located above it. Bismuth melting and overheating were performed in argon atmosphere. Bismuth melt (0.2-0.5 kg mass) was supplied into water inside a submersible termos. It is ascertained that there is a certain time interval between the beginning of the termos immersion under the water face level and constant of interacting media. A long delay (from 0.3 to 2.1 s) is observed between the initiation of the constant and steam explosion. Steam explosions occurred outside the termos cavity. The coefficient of thermal power conversion into mechanical one during the interaction reached 1-2%. Melt mass growth resulted in a proportional increase of pressure pulsation period. 2 refs.; 3 figs.; 1 tab.

26246 (IAEA-TECDOC–697) **Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.** International Atomic Energy Agency, Vienna (Austria). Apr 1993. [235p.] (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of the meeting was to review the state of the art in fission gas release and fuel rod chemistry related to extended burnup. The meeting was held in a time when national and international programmes on water reactor fuel irradiated in experimental reactors were still ongoing or had reached their conclusion, and when lead test assemblies had reached high burnup in power reactors and been examined. At the same time, several out-of-pile experiments on high burnup fuel or with simulated fuel were being carried out. As a result, significant progress has been registered since the last meeting, particularly in the evaluation of fuel temperature, the degradation of the global thermal conductivity with burnup and in the understanding of the impact on fission gas release. Fifty five participants from 16 countries and one international organization attended the meeting. 28 papers were presented. A separate abstract was prepared for each of the papers. Refs, figs, tabs and photos.

26247 (IAEA-TECDOC–697, pp. 44-52) **Fission gas release behavior of high burnup fuels during power ramp tests.** Aoki, T. (Nuclear Power Engineering Center, Tokyo (Japan)); Koizumi, S.; Umehara, H.; Ogata, K. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

The Nuclear Power Engineering Test Center (NUPEC) conducted the MITI-sponsored Verification Test Program on High Performance Fuel to investigate the ramp behavior of Zr-linear fuels. This paper discusses fission gas behavior by correlating gas release data and pellet microstructural changes. 1 ref., 9 figs, 1 tab., 2 photos.

26248 (INIS-mf–12758, pp. 408-412) **General features of conceptual design for the pilot plant to manufacture fuel rods from mixed oxides.** Quesada, C.A. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Dept. de Combustibles Nucleares); Adeliang, P.; Esteban, A.; Aparicio, G.; Friedenthal, M.; Orlando, O.S. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

This paper conceptually describes: (1) the processes in the manufacturing lines; (2) the distribution of quality controls and glove boxes in manufacturing lines; (3) the Control and Radiological Safety Room; (4) the Dressing Room; (5) the requirements of the ventilation system. The plant will be located in the first floor of the Radiochemical Processes Laboratory building, occupying a surface of 600 m^2. The necessary equipment for the following manufacturing lines will be provided: (a) conversion from Pu(NO3)4 to PuO 2 (through Pu(III)oxalate); (b) manufacture of homogeneous of mixed oxides of U and Pu; (c) manufacture of $(U,Pu)O_2$ pellets; (d) manufacture of fuel rods of mixed uranium and plutonium oxides. (Author).

26249 (INIS-mf–12758, pp. 413-417) **Equipment to weld fuel rods of mixed oxides.** Aparicio, G. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Dept. de Combustibles Nucleares); Orlando, O.S.; Olano, V.R.; Toubes, B.; Munoz, C.A. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

Two welding outfits system T1G were designed and constructed to weld fuel rods with mixed oxides pellets (uranium and plutonium). One of them is connected to a glove box where the loading of sheaths takes place. The sheaths are driven to the welder through a removable plug pusher in the welding chamber. This equipment was designed to perform welding tests changing the parameters (gas composition and pressure, welding current, electrode position, etc.). The components of the welder, such as plug holder, chamber closure and peripheral accessories, were designed and constructed taking into account the working pressures in the machine, which is placed in a controlled area and connected to a glove box, where special safety conditions are necessary. The equipment to weld fuel bars is complemented by another machine, located in cold area, of the type presently used in the fuel elements factory. This equipment has been designed to perform some welding operations in sheaths and mixed oxide rods of the type Atucha I and II. Both machines have a programmed power supply of wide range and a vacuum, and pressurizing system that allows the change of parameters. Both systems have special features of handling and operation. (Author).

2204 Control Systems

Advanced control rooms for future nuclear power plants are being designed utilizing computer-based technologies. The US Nuclear Regulatory Commission reviews the human engineering aspects of such control rooms to ensure that they are designed to good human factors engineering principles and that operator performance and reliability are appropriately supported in order to protect public health and safety. This paper describes a general approach to advanced human-system interface review, development of human factors guidelines to support NRC safety reviews of advanced systems, and the results of a guideline test and evaluation program.

26251 (BNL-NUREG–48658) **Development of guidelines to review advanced human-system interfaces.** O'Hara, J.M. Brookhaven National Lab., Upton, NY (United States). [1993]. 4p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930601–20: American Nuclear Society (ANS) annual meeting, San Diego, CA (United States), 20-24 Jun 1993). Order Number DE93014004. Source: OSTI; NTIS; INIS; GPO Dep.

Advanced control rooms (ACRS) will utilize advanced human-system interface (HSI) technologies that may have significant implications for plant safety in that they will affect the operators overall role in the system, the method of information presentation, and the ways in which operators interact with the system. The US Nuclear Regulatory Commission (NRC) reviews the HSI aspects of control rooms to ensure that they are designed to good human factors engineering principles and that operator performance and reliability are appropriately supported in order to protect public health and safety. The principal guidance available to the NRC, however, was developed more than ten years ago, well prior to these technological changes. Accordingly, the human factors guidance needs to be updated to serve as the basis for NRC review of these advanced designs. The purpose of this paper is to discuss the development, evaluation, and current status of the Advanced HSI Design Review Guideline, hereafter referred to as the "Guideline."

26252 (CONF-921007–29) **Technical basis for acceptance criteria on the susceptibility of digital systems to electromagnetic interference.** Ewing, P.D. (Oak Ridge National Lab., TN (US)); Korsah, K.; Antonescu, C. Oak Ridge National Lab., TN (United States). [1992]. 32p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From 20. water reactor safety information meeting; Bethesda, MD (United States); 21-23 Oct 1992. Order Number DE93015448. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses the development of the technical basis for establishing acceptance criteria on the susceptibility of digital systems to electromagnetic interference (EMI). The effort is sponsored by the US Nuclear Regulatory Commission and stems from the safety-related issues that need to be addressed with the application of digital instrumentation and controls systems in nuclear power plants. Designers of digital circuits are incorporating increasingly higher clock frequencies and lower logic voltage levels, thereby leading to the risk of susceptibility when spurious interference is misinterpreted as legitimate logic. Development of the technical basis for acceptance criteria centers around establishing good engineering practices to ensure that sufficient levels of electromagnetic compatibility (EMC) are maintained between the nuclear power plant's electronic and electromechanical systems. First, good EMC design and installation practices are needed to control the emissions from interference sources and their impact on other nearby circuits and systems. Then, a test and evaluation program is needed to outline the EMI tests to be performed, the associated test methods to be followed, and adequate test limits to ensure that the circuit or system under test meets the recommended guidelines. Test and evaluation should be followed by periodic maintenance to assess whether the recommended EMI control practices continue to be adhered to as part of the routine operation of the nuclear power plant. By following these steps, the probability of encountering safety-related problems associated with EMI will be greatly reduced.

26253 (CONF-930401–15) **Qualification issues for advanced light-water reactor protection systems.** Korsah, K. (Oak Ridge National Lab., TN (United States)); Clark, R.L.; Antonescu, C. Oak Ridge National Lab., TN (United States). [1993]. 13p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From Meeting

on nuclear plant instrumentation, control and man-machine interface technologies; Oak Ridge, TN (United States); 18-21 Apr 1993. Order Number DE93010262. Source: OSTI; NTIS; INIS; GPO Dep.

The instrumentation and control (I&C) systems in advanced reactors will make extensive use of digital controls, microprocessors, multiplexing, and fiber optic transmission. Elements of these advances in I&C have been implemented on some current operating plants. However, the widespread use of the above technologies, as well as the use of artificial intelligence with minimum reliance on human operator control of reactors, highlights the need to develop standards for qualifying the I&C used in the next generation of nuclear power plants. As a first step in this direction, the protection system I&C for present-day plants was compared to that proposed for advanced light-water reactors (ALWRs). An evaluation template was developed by assembling a configuration of a safety channel instrument string for a generic ALWR, then comparing the impact of environmental stressors on that string to their effect on an equivalent instrument string from an existing light-water reactor. The template was then used to suggest a methodology for the qualification of microprocessor-based protection systems. The methodology identifies standards/regulatory guides (or lack thereof) for the qualification of microprocessor-based safety I&C systems. This approach addresses in part issues raised in NRC policy document SECY-91-292, which recognizes that advanced I&C systems for the nuclear industry are "being developed without consensus standards. as the technology available for design is ahead of the technology that is well understood through experience and supported by application standards."

26254 (CONF-9305215–1) **Addressing the susceptibility of digital systems to electromagnetic interference.** Ewing, P.D. (Oak Ridge National Lab., TN (US)); Korsah, K.; Antonescu, C. Oak Ridge National Lab., TN (United States). [1993]. 13p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From IAEA specialists meeting on experience in ageing, maintenance and modernization of instrumentation and control systems for improving nuclear power plant availability; Rockville, MD (United States); 5-7 May 1993. Order Number DE93015434. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses the development of the technical basis for acceptance criteria applicable to the immunization of digital systems against electromagnetic interference (EMI). The work is sponsored by the US Nuclear Regulatory Commission and stems from the safety-related issues that need to be addressed as a result of the application of digital instrumentation and control systems in nuclear power plants. Designers of digital circuits are incorporating increasingly higher clock frequencies and lower logic level voltages, thereby leading to potentially greater susceptibility of spurious interference being misinterpreted as legitimate logic. Development of the technical basis for acceptance criteria to apply to these digital systems centers around establishing good engineering practices to ensure that sufficient levels of electromagnetic compatibility (EMC) are maintained between the nuclear power plant's electronic and electromechanical systems. First, good EMC design and installation practices are needed to control the emissions from interference sources and thereby their impact on other nearby circuits and systems. Second, a verification and validation (V&V) program is needed to outline the EMI tests to be performed, the associated test methods to be followed, and adequate acceptance criteria to ensure that the circuit or system under test meets the recommended guidelines. V&V should be followed by periodic maintenance to assess whether the recommended EMI control practices continue to be adhered to as part of the routine operation of the nuclear power plant. By following these steps, the probability of encountering safety-related instrumentation susceptibility attributable to EMI will be greatly reduced.

26255 (EDF–93-NB-00004) **Human reliability and human factors in complex organizations: epistemological and critical analysis - practical avenues to action.** Llory, A. Electricite de France (EDF), 92 - Clamart (France). Aug 1991. [13p.] (In French). Order Number DE93631492. Source: OSTI; NTIS (US Sales Only); INIS.

This article starts out with comment on the existence of persistent problems inherent to probabilistic safety assessments (PSA). It first surveys existing American documents on the subject which make a certain number of criticisms on human reliability analyses, e.g. limitations due to the scant quantities of data available, lack of a basic theoretical model, non-reproducibility of analyses, etc. The article therefore examines and criticizes the epistemological bases of these analyses. One of the fundamental points stressed is that human reliability analyses do not take account of all the special features of the work situation which result in human error (so as to draw up statistical data from a sufficiently representative number of cases), and consequently lose all notion of the 'relationships' between human errors and the different aspects of the working environment. The other key points of criticism concern the collective nature of work which is not taken into account, and the frequent confusion between what operatives actually do and their formally prescribed job-tasks. The article proposes aspects to be given thought in order to overcome these difficulties, e.g. quantitative assessment of the social environment within a company, non-linear model for assessment of the accident rate, analysis of stress levels in staff on off-shore platforms. The method approaches used in these three studies are of the same type, and could be transposed to human-reliability problems. The article then goes into greater depth on thinking aimed at developing a 'positive' view of the human factor (and not just a 'negative' one, i.e. centred on human errors and organizational malfunctions), applying investigation methods developed in the occupational human sciences (occupational psychodynamics, ergonomics, occupational sociology). The importance of operatives working as actors of a team is stressed.

26256 (IAEA-TECDOC–700) **The potential of knowledge based systems in nuclear installations: Report of a specialists' meeting/workshop held in Erlangen, Germany, 21-25 September 1992.** International Atomic Energy Agency, Vienna (Austria). Apr 1993. [97p.] (CONF-9209356–: Specialists meeting/workshop on the potential of knowledge based systems in nuclear installations, Erlangen (Germany), 21-25 Sep 1992). Order Number DE93629675. Source: OSTI; NTIS (US Sales Only); INIS.

The integration of the knowledge based systems (KBS) with processes is a new challenge for artificial intelligence developments. Integration requires improved robustness of the KBS, using methodologies which cater for building well structured, modular applications, and for verification and validation. The following key points related to KBS development were discussed during the meeting: state of the art in knowledge representation and reasoning; methods for building KBS; tools and computers used for building and implementing KBS; requirements for verification and validation; communication between KBS and the process, and between the KBS and the operators. 9 papers were presented by participants. A separate abstract was prepared for each of the papers. Refs and figs.

26257 (IAEA-TECDOC–700, pp. 17-27) **Expert system application and neural network development for nuclear safety improvement.** Viron, F. de (TRACTEBEL, Brussels (Belgium)); Vlaminck, M. de. International Atomic Energy Agency, Vienna (Austria). Apr 1993. Source: OSTI; NTIS (US Sales Only); INIS.

The basic concept of a Frequency-Based On-Line Expert System (FBOLES) approach for the on-line fault diagnoses of nuclear power plants has been previously presented in our companion papers. This paper reports the status of the software development and some of our experiment results. The main steam and feedwater condensate systems (MSFCS, namely the secondary loop) of a nuclear power plant simulated by the Tsinghua simulator has been selected as a target system of the present stage of development. The knowledge bases for MSFCS has been initially constructed. A total of 62 signals from the simulator have been selected as the on-line evidence for diagnosis. As a software package, FBOLES can perform either the on-line diagnosis where the signals are input from the simulator directly or the off-line diagnosis where the signals are input by users from the keyboard. Also, the information base including the knowledge bases can be modified by users easily and can be compiled by FBOLES into coded format that is really used in diagnosis. (author). 4 refs, 9 figs.

The paper describes the present state and future prospects of the Expert System for Operator Support (ESOS) developed at the Nuclear Research Institute at Rez near Prague (NRI). Special emphasis is put on knowledge acquisition and knowledge base representation means - ERB. ERB is a package of programs, which enables the user to create, edit and compile a knowledge base of the Expert System RECON, to create and edit testing data and to test knowledge base (KB). The knowledge base is displayed in the form of a graph, where nodes represent the rules and arcs represent the relations "PREDECESSOR → SUCCESSOR." The filling of KB is integrated with the design of their graphical representation. Owing to this, the form of the KB representation makes the whole KB more understandable. The filling process of KB corresponds with general methodologies, where in the first step nodes with identifiers and texts are defined, in the second step relations between them are specified, in the third step the predecessor is defined and finally, relations between nodes are concretized. The paper contains a description of the functions offered by the ERB. (author). 2 refs, 5 figs.

26260 (IAEA-TECDOC–700, pp. 77-80) **A personal computer program for emergency operating procedures support.** Salamun, I. (Institut Jozef Stefan, Ljubljana (Yugoslavia)); Mavko, B.; Stritar, A. International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9209356–: Specialists meeting/workshop on the potential of knowledge based systems in nuclear installations, Erlangen (Germany), 21-25 Sep 1992). In *The potential of knowledge based systems in nuclear installations: Report of a specialists' meeting/workshop held in Erlangen, Germany, 21-25 September 1992.* [97p.] Order Number DE93629675. Source: OSTI; NTIS (US Sales Only); INIS.

EmDiSy is the computer code for the presentation of emergency operating procedures. It uses knowledge from the database file and presents it to the operator in different visualization forms. It starts with high priority procedure and then leads the operator through procedures respective to the nuclear power plant condition. Each procedure is represented by six different windows. The first three windows describe the purpose of the procedure, the symptoms and entry conditions of the system and the automatic actions at appointed condition. The next three windows represent a tree of steps through the active procedure, describes action in the active step and represents a 3D picture of the system or 2D picture of status trees. They include parameter values needed in the procedure to describe plant condition. Pictures drawn in 3D parallel projection clearly describe the condition of the system and action that must be taken. In a special window EmDiSy presents connection between procedures. EmDiSy clearly shows to the operator actions that must be taken during emergencies in a nuclear power plant and points into the realistic place of the action. EmDiSy could be extended with the advanced system to give the operator advice respective to nuclear power plant condition. (author). 3 refs, 4 figs.

26261 (IAEA-TECDOC–700, pp. 87-93) **A situation related, mnemonic tool for expert tasks.** Simon, L. (FORWISS, Erlangen (Germany)). International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9209356–: Specialists meeting/workshop on the potential of knowledge based systems in nuclear installations, Erlangen (Germany), 21-25 Sep 1992). Source: OSTI; NTIS (US Sales Only); INIS.

Practical tasks far too complex and responsible to be performed automatically by intelligent systems, such as 'operating nuclear power plants in dangerous situations', require intelligent operation manuals to support human experts. During task performance operation manuals are usually accessed by using included descriptions of task flow. As with simple tasks, the standard way to describe flow of complex expert tasks is to present complete instructional sequences or collections of associations between situations and possible activities. However, both approaches fail to describe adequately expert task flow, and therefore are not able to provide appropriate access to operation manuals for expert tasks. In this article we will present a newly developed formal language for adequately describing the flow of expert tasks, called 'ExpertStruct', which includes an inference engine to compute - given a task description and a present situation - possible continuations of the task. If a description of an expert task based on the language is integrated into a hypertext operation manual, it can provide appropriate, situation-related access to stored information. It acts as a mnemonic tool for monitoring and controlling task flow, which relates itself automatically to the present situation. (author). 20 refs, 4 figs.

26262 (INIS-mf–12758, pp. 601-607) **Instrumentation and control engineering at ENACE (Argentine Nuclear Enterprise of Electric Power Plants S.A.).** Roca, J.L. (Empresa Nuclear Argentina de Centrales Electricas SA (ENACE), Buenos Aires (Argentina)); Garzon, D. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

This paper describes the techniques used in the project of instrumentation and control for the Atucha II nuclear power plant, from the original flow diagram of the system whose instrumentation and control is requested to the functional binary diagrams and control loops, through measurement sheets and other documentation. An account of the organization and handling of this mass of information is given, using an electronic processing system of data file for the project. A brief description of the task implied in the completing and updating of these files defines the scheme in which all the documentation development associated with a given process is included. (Author).

American meeting; first sessions on nuclear power plants. Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

To make evident the incidence of the technology modification due to the increasing automation of energy control plants on man, whose activity is limited to observation and control, with low working metabolism and high attention and concentration. The methodology is fundamentally based on the individual analysis of the factors affecting man. The following will be considered: (a) load volume: the load volume generated by the above mentioned activity depends on the observation period, the number of indicators to be observed and the frequency of control activities; (b) active participation: the lack of active participation due to a motionless task requires a constant yield disposition to develop an unusual activity; (c) monotonous activity: the load is produced by maintaining a suitable physic-mental state through a volition effort; (d) change of disposition: this component, which is not willingly admitted, changes the mechanism of compared functions during the day, following a biological law that depends from the hour; (e) environment influence: the unfavorable physical influences, like climate, lack of light, noise, etc. also affect man. The analysis of mental load is specially important due to its influence on the performance, the accident risk and the safety of the system to be controlled. (Author).

26264 (SR/H–546) **[Project 98-1086, Technical scopes of work, Instrument, February 9, 1959–January 7, 1963].** [Engineering Department project files]. This document provides the scope of work for the procurement and installation of instrumentation for the Heavy Water Components Test Reactor (HWCTR).

26265 (UCRL-JC–110425) **The "glass" control room and human error in the nuclear power plant.** Bennett, C.T.; Kimura, C.Y. Lawrence Livermore National Lab., CA (United States). 15 Oct 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9301102–7: American Nuclear Society (ANS) meeting, Clearwater, FL (United States), 27 Jan 1993). Order Number DE93012597. Source: OSTI; NTIS; GPO Dep.

We discuss the design philosophy that should be applied to a nuclear facility using electronic, "glass" displays for presentation critical information. A brief history of and problems related to the use of electronic displays in the aviation industry is presented, along with the parallel history of the use of electronic displays in the nuclear power industry. These discussions are followed by a discussion of the display guidelines that should be considered to minimize human error, and maximize safety and performance.

26266 (CPL-B–226) **Community emergency response to nuclear power plant accidents: A selected and partially annotated bibliography.** Youngen, G. Council of Planning Librarians, Monticello, IL (United States). Oct 1988. 43p. Source: OSTI; INIS; American Planning Association, 1313 East 60th Street, Chicago, IL 60637 (US).

The role of responding to emergencies at nuclear power plants is often considered the responsibility of the personnel onsite. This is true for most, if not all, of the incidents that may happen during the course of the plant's operating lifetime. There is however, the possibility of a major accident occurring at anytime. Major nuclear accidents at Chernobyl and Three Mile Island have taught their respective countries and communities a significant lesson in local emergency preparedness and response. Through these accidents, the rest of the world can also learn a great deal about planning, preparing and responding to the emergencies unique to nuclear power. This bibliography contains books, journal articles, conference papers and government reports on emergency response to nuclear power plant accidents. It does not contain citations for "onsite" response or planning, nor does it cover the areas of radiation releases from transportation accidents. The compiler has attempted to bring together a sampling of the world's collective written experience on dealing with nuclear reactor accidents on the sate, local and community levels. Since the accidents at Three Mile Island and Chernobyl, that written experience has grown enormously.

26267 (DOE-HMIP-RR–92.110) **Assessment of options for the treatment of Sizewell PWR liquid effluent.** Hornby, J.; Allam, J.; Knibbs, R.H. AEA Technology, Harwell (United Kingdom). 1992. [134p.] Sponsored by Department of the Environment, London (United Kingdom). Her Majesty's Inspectorate of Pollution. Contract PECD-7/9/431;A1/CF/744. Order Number DE93631577. Source: OSTI; NTIS (US Sales Only); INIS.

This report describes the origins of PWR liquid waste streams, their composition and rates of arising. Data has been collected from operational PWRs and estimates obtained for Sizewell B PWR liquid waste streams. Current liquid waste treatment practices are reviewed and assessments made of established and novel treatment techniques which could be applicable to Sizewell B. A short list of treatment options is given and recommendations are made relating to established treatment technologies suitable for Sizewell B and also to development work on more novel treatments which could lead to a reduction in waste disposal volumes. (author).

26268 (DUN–3955) **Fission product release rate from aluminum clad uranium fuel.** Traxler, F.C. Douglas United Nuclear, Inc., Richland, WA (United States). 22 Mar 1968. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012156. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The rate of fission product inventory release to the environment as a result of exposure of uranium fuel to high temperatures should be known to more realistically assess the consequences of a credible accident. To obtain an acceptable experimental evaluation of releases it is necessary to have similar conditions to those which would exist in the reactor. Fission product release rate experiments exploring temperatures below the uranium melting point were performed for Douglas United Nuclear by D. L. Reid of Battelle-Northwest. Data and some conclusions from the initial tests are presented in this report. The intent of distributing this information is to make known results and to record data transmitted in correspondence from Battelle-Northwest to DUN.

26269 (EUR–14043/5) **Assessment of management alternatives for LWR wastes. Volume 5. Assessment of the radiological impact to the public resulting from discharges of radioactive effluents.** Centner, B. (Belgatom SA, Brussels (Belgium)). Commission of the European Communities, Luxembourg (Luxembourg). 1993. [147p.] Source: OSTI; NTIS (US Sales Only); INIS.

This report deals with the assessment of the radiological impact to the public resulting from discharges of radioactive effluents (liquid and gaseous) in connection with the implementation of the Belgian scenario for the management of PWR waste. Both individual and collective doses have been estimated for a critical group of the population living around the nuclear power plants concerned. This study is part of an overall theoretical exercise aimed at evaluating a selection of management wastes for LWR waste based on economical and radiological criteria.

26270 (EUR–14043/7) **Assessment of management alternatives for LWR wastes. Volume 7. Cost and radiological impact associated with near-surface disposal of reactor waste (French concept).** Malherbe, J. (CEA, 75 - Paris (France)). Commission of the European Communities, Luxembourg (Luxembourg). 1993. [48p.] Contract FI1W/0135-F. Source: OSTI; NTIS (US Sales Only); INIS.

This report deals with the determination of the cost and the radiological impact associated with a near-surface disposal site (French concept) for low and medium-level radioactive waste generated during operation of a 20 GWe nuclear park composed of LWRs for 30 years. This study is part of an overall theoretical exercise aimed at evaluating a selection of management routes for LWR waste based on economical and radiological criteria.

26271 (HW–73026) **Production reactor process tube, dummy, and fuel element cladding film and radioactivity studies.** Perrigo, L.D. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 14 Mar 1962. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012070. Source: OSTI; NTIS (US Sales Only); GPO Dep.

During the normal operation of reactors ionic, particulate and colloidal substances in the coolant are activated as they pass through the neutron flux. The parent substances for the activated materials come from several sources: transient corrosion products from the coolant system piping and fuel element cladding, coolant additives and coolant impurities. Previous studies have shown that a major portion of these substances do not simply pass through the neutron flux field but undergo complex sorption phenomena that result in effluent radio-nuclide levels considerably in excess of what would be expected from activation on a once-through basis. This report is being written to outline studies that will provide activity inventory data that will aid in defining radionuclide retention reactions in reactor coolant systems.

26272 (INIS-mf–12758, pp. 534-545) **Influence of precipitations, buildings and over increase of radioactive emission in the population dose calculation under accident conditions.** Conte, M.C. (Empresa Nuclear Argentina de Centrales Electricas SA (ENACE), Buenos Aires (Argentina)). Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The influence of precipitations is analyzed, as well as of buildings and emission over increase on the dosis produced on the population as a consequence of some postulated accidents in Atucha II nuclear power plant. The following conclusions were achieved: the calculations performed without considering the above mentioned effects are conservative, excluding the case in which the precipitation is very close to the emission source. In this case, the maximal difference observed was 20% for class C and 5% for class D, at 1 km from source, with a decreasing difference according to the distance. The doses calculated without building effect were approximately 25% greater than those calculated considering this effect for class E and 40% for class F, at 1 km from the source. The difference decreases with distance and increases with the stability of atmospheric conditions. This behaviour is also observed with the over increase effect. In this case, the maximal observed differences were of one order of magnitude for class E and three orders for class F, at 1 km from the source. (Author).

26273 (NUREG/CR–5247-Vol.2) **RASCAL Version 2.0 workbook: Volume 2.** Athey, G.F. (Athey Consulting, Charles Town, WV (United States)); McKenna, T.J. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Operational Assessment; Athey Consulting, Charles Town, WV (United States). May 1993. 99p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; INIS; GPO; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020.

The Radiological Assessment System for Consequence Analysis, Version 2.0 (RASCAL 2.0) has been developed for use by the NRC personnel who respond to radiological emergencies. This workbook is intended to complement the RASCAL 2.0 User's Guide (NUREG/CR-5247, Vol. 1). The workbook contains exercises designed to familiarize the user with the computer based tools of RASCAL through hands-on problem solving. The workbook is composed of four major sections. The first part is a RASCAL familiarization exercise to acquaint the user with the operation of the forms, menus, on-line help, and documentation. The latter three parts contain exercises in using the three tools of RASCAL Version 2.0: DECAY, FM-DOSE, and ST-DOSE. Each section of exercises is followed by discussion on how the tools could be used to solve the problem.

26274 (NUREG/CR–5778-Vol.3) **New York/New Jersey regional seismic network: Final report for April 1985–September 1992: Volume 3.** Seeber, L. (Columbia Univ., Palisades, NY (US). Lamont-Doherty Earth Observatory); Johnson, D.; Armbruster, J. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Columbia Univ., Palisades, NY (United States). Lamont-Doherty Earth Observatory. Jul 1993. 71p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

For almost 20 years, Lamont-Doherty Earth Observatory has operated the primary network for monitoring earthquake activity in the New York State, northern New Jersey, and northwestern Vermont area, with support by both NRC and the USGS. The primary purpose of this research is directed toward the determination of local seismicity and the possible identification of associated geologic and tectonic features. From April 1985 to September 1992, the network recorded and located 346 regional earthquakes. Scientific activity, primarily in the form of aftershock monitoring, was concentrated upon a number of significant earthquakes: The Ardsley, NY; the Chardon, OH; the Ashtabula, OH; and the Saguenay, Canada earthquakes; in addition to the Summit, NY event. These studies involved the deployment of portable seismographs in the epicentral areas. Many of these sequences were in northeastern North America, but outside the L-DEO seismic network and were not covered by other permanent networks. Spatial correlations between structures and earthquakes were found at a wide range of scales, and systematic searches of archival material were used to improve constraints on historic sources.

26275 (ORNL/FTR–4118) **Modular High-Temperature Gas-Cooled Reactor COMEDIE Fission Product Transport Program: Foreign trip report, October 11–20, 1991.** Kimball, O.F. Oak Ridge National Lab., TN (United States). 5 Nov 1991. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011086. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The COMEDIE loop is an engineering-scale experimental loop that will be operated in the SILOE reactor pool at CENG to obtain an independent data base that can be used to validate MHTGR fission product transport codes. Testing will be done under representative MHTGR conditions with representative components. Designed-to-fail (dtf) fuel particles, under irradiation, will release fission products that will be transported and distributed through the fuel block, a graphite block representing the lower reflector element, and a gas/gas heat exchanger representing the metallic surfaces in the primary circuit of an MHTGR. A depressurization section in the loop produces blowdowns simulating possible depressurization events. The primary purpose of this review meeting was to prepare for the first irradiation test that will start in December 1991 (irradiation will begin in January 1992). All technical and programmatic issues to be solved before the start of the lint irradiation test were resolved.

26276 (ORNL/FTR–4178) **Final irradiation report for the HFR-B1 experiment and postirradiation examinations for HFR-B1: Foreign trip report, October 12–December 30, 1991.** Myers, B.F. Oak Ridge National Lab., TN (United States). 10 Jan 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011054. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses travel to the JRC Petten was for the purpose of collaborating in preparing and writing the final irradiation report for experiment HFR-B1. At the end of the travel, the tasks remaining to be completed are the thermal calculations, corrections to the fission gas release data, and a part of the text. The estimated date of completion of a draft report by JRC is April 1992. Analysis of the experiment can nevertheless be started at present. In preparing data for the calculations, the dimensional change in H-451 graphite was found to be smaller in the presence of water vapor than in its absence. The postirradiation examination of HFR-B1 being conducted at the Forschungszentrum Juelich was reviewed. A new course was set for the hydrolysis experiments. The behavior of fission products was discussed by representatives from Germany, Japan, Russia, and the United States at the technical workshop held in Juelich. A planned International Atomic Energy Agency (IAEA) effort to initiate an international cooperative task on fission product behavior was presented and briefly discussed.

26277 (SSI–92-19) **Quality assurance of radiation monitoring performed of the swedish nuclear industry. Discharges of liquid wastes 1989.** Swedish Radiation Protection Inst., Stockholm (Sweden). Nov 1992. [33p.] (In Swedish). Order Number DE93630788. Source: OSTI; NTIS; INIS.

The swedish nuclear power plants have own administration of some radiation monitoring. These monitoring programs are quality controlled by the Swedish Radiation Protection Institute (SSI). The report presents the results of the quality control 1989. The following were controlled: Interlaboratory comparisons of Sr-90 measurements discharge of liquid wastes 1989. Discharge of plutonium 1988.

26278 (SSI–92-21) **Quality assurance of radiation monitoring performed at the swedish nuclear industry. Discharge of liquid wastes 1990.** Swedish Radiation Protection Inst., Stockholm (Sweden). Dec 1992. [34p.] (In Swedish). Order Number DE93630789. Source: OSTI; NTIS; INIS.

The swedish nuclear power plants have own administration of some radiation monitoring. These monitoring programs are quality controlled by the Swedish Radiation Protection Institute (SSI). The report presents the results of the quality control 1990. The following were controlled: Interlaboratory comparisons of measurements of gamma emitting nuclides in water. Discharge of liquid wastes. Discharge of plutonium.

The future success of the nuclear power option in the US (fission and fusion) depends critically on the continued existence of a healthy national materials-irradiation program. Consideration of the requirements for acceptable materials-irradiation systems in a new neutron source has led the subcommittee to identify an advanced steady-state reactor (ANS) as a better choice than a spallation neutron source. However, the subcommittee also hastens to point out that the ANS cannot stand alone as the nation's sole high-flux mixed-spectrum neutron irradiation source in the next century. It must be incorporated in a broader program that includes other currently existing neutron irradiation facilities. Upgrading and continuing support for these facilities must be planned. In particular, serious consideration should be given to converting the HFIR into a dedicated materials test reactor, and long-term support for several university reactors should be established.

26280 (CONF-930702–21) **Full scale dynamic fracture testing of degraded pipe.** Poole, A.B.; Battiste, R.L.; Clinard, J.A. Oak Ridge National Lab., TN (United States). [1993]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Pressure vessels and piping conference; Denver, CO (United States); 25-29 Jul 1993. Order Number DE93012966. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Oak Ridge National Laboratory (ORNL) has completed a major task for the Department of Energy (DOE) in the demonstration that the primary piping of the New Production Reactor-Heavy Water Reactor (NPR-HWR), with its relatively moderate temperature and pressure, should not suffer an instantaneous double-ended-guillotine-break (DEGB) under design basis loadings and conditions. This paper provides the results of the second pipe test series in this program. In this series, a section of aged 304 stainless steel piping was loaded in fully reversed bending cycles at large loads. An initial flaw size was based on leakage flow testing at pressure and temperature for the NPR-HWR. The detectable leakage flaw was cycled in bending at large loads for 40 cycles. These test results are discussed in this paper.

This document recounts Du Pont's management of the Savannah River Plant. The events covered by this initial volume of the SRP History occurred, in most cases, in the period beginning just prior to release by the Construction Division of the various facilities and ending July 1, 1953. The buildup of the Plant operating organization and the bases for major decisions are described in the sections devoted to the various departments. Basically, the operating organization was patterned after those in the Company's commercial plants of comparable size and diversification. The Company's commercial plant policies and practices had been adopted by the Atomic Energy Division and governed the decisions reached at the Savannah River Plant.

This monthly progress report details activities of the Works Technical Department during the month of February 1963.

26299 (DPW–3660) **[Travel to Argonne National Laboratory to observe critical experiments]: Trip report, October 23, 1951.** Toops, E.C. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). 31 Oct 1951. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–466). Order Number DE93011163. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report describes travel to observe and coordinate the progress of Argonne critical experiments. (FL)

26300 (DPW–3668) **[Proposed training on canning at Hanford].** Dickerson, H.A. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 31 Oct 1951. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–468). Order Number DE93011165. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum discusses a proposal to send two groups of trainees to Hanford for training in the Canning Area. (FL)

26301 (DPW–4358) **Construction progress at Savannah River concerning reactor parts and line boring at the NYX Unit and plenum, top shield and tube welding concerns at the R Unit.** Elliott, J.F. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). 16 Jan 1952. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–436). Order Number DE93011130. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum discusses construction progress at Savannah River concerning reactor parts and line boring at the NYX unit.

26302 (DPW–4477) **Travel to Bendix Aviation Company's plant at Kansas City, Missouri, to observe the machining operations, and associated work for the production of slugs under the uranium experimental program: Trip report.** Hobert, R.H. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 9 Jan 1952. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–463). Order Number DE93011158. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum discusses travel to Bendix Aviation company's plant at Kansas City, Missouri which was made for the purpose of observing the machining operations, and associated work, for the production of slugs under the uranium experimental program.

26303 (DUN–5566-1) **Operations Division single pass reactors semiannual summary report, period ending June 30, 1969.** Prudich, T. Douglas United Nuclear, Inc., Richland, WA (United States). 1 Oct 1969. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012056. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In this semiannual issue the single pass reactor and water plant data are shown for the six-months' period January through June, 1969, (except for C Reactor which is shown for January through April, 1969, because of deactivation at 1610 hours on April 25, 1969) together with data for the three preceding six-months' periods. For comparison purposes the two years of experience will continue to be shown by dropping and adding a six-months' period with each semiannual issue.

26304 (DUN–5566-2) **Operations Division single pass reactors semiannual summary report, period ending December 31, 1969.** Prudich, T. Douglas United Nuclear, Inc., Richland, WA (United States). 11 Feb 1970. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012057. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In this semiannual issued the single pass reactor and water plant data are shown for the six-months' period July through December, 1969 together with data for the three preceding six-months' periods.

26305 (EGG-M–93067) **RELAP5/MOD2.5 simulation results for the Separate Effects Test experiment series, Phase 1.** Gaeta, M.J. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Bollinger, J.S.; Dimenna, R.A. EG and G Idaho, Inc., Idaho Falls, ID (United States); Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93013670. Source: OSTI; NTIS; INIS; GPO Dep.

The Separate Effects Test (SET) facility is a one-fourth linear scale model of a portion of a production reactor at the Savannah River Site. The Phase I configuration is prototypical of a one-sixth sector of the moderator tank and a portion of a single pump suction piping (PSP) loop. The purpose of this work was to perform a preliminary investigation into the suitability of the full-scale SRL reactor modeling methodology to the one-fourth linear scale SET facility. The resulting model will also aid in understanding the experimental results produced by the SET experimental test series. Section 2 gives a brief description of the experimental facility. Section 3 describes the code version of RELAP5 used for this work and the SET input model constructed for the simulations. Section 4 describes the results of the model tuning and the single and two-phase simulations. Sections 5 and 6 contain the conclusions and references respectively.

26306 (FEI–2027) **Experimental testing of the Monte Carlo calculations for prompt neutron lifetime dependence on reactivity of a fast reactor with slowing-down reflector.** Daruga, V.K.; Polevoj, V.B. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1989. [11p.] (In Russian). Order Number DE93629735. Source: OSTI; NTIS (US Sales Only); INIS.

The article presents the results of measuring asymptotic decrement of prompt neutron pulse attenuation in a fast breeder reactor with a slowing down reflector (SR FBR) depending on its subcriticality produced in different ways. The calculations are performed by the Monte Carlo method in 26-group approximation relying on the solution of a quasistationary problem of prompt neutron transport. A good agreement of the calculational and experimental data as regards criticality and their significant divergence with subcriticality growth are noted. A conclusion is made on the appropriateness of the calculation of lifetime in SR FBR using a neutron thermalization model. It is shown that the calculation based only on the solution of the conventionally critical problem disagrees with the experimental data several times. 11 refs.; 3 figs.; 1 tab.

26307 (HW–54942) **Status report – Fuel element machining.** Nickolaus, J.W. Hanford Atomic Products Operation, Richland, WA (United States). 12 Feb 1958. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93014279. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report summarizes the design and development work completed since May, 1957; the current status of fuel element matching problems, and the plans for future modifications to improve machining techniques.

26308 (INIS-mf–12758, pp. 7-14) **HERMET: cell neutronic calculation code for MTR (materials testing reactors) fuels.** Villarino, E.A. (Investigacion Aplicada SE (INVAP), San Carlos de Bariloche (Argentina)); Lecot, C.A.; Giust, F.D. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The HERMET neutronic calculation code was developed for resolution of systems, at a cell calculation level in one-dimensional plain geometry (MTR), preserving its heterogeneous character with or without reflecting boundary conditions and reducing the cost as regards time and machine-memory. This code also includes the burn-up calculation which may be performed with the critical spectra B0, B1 or the one improved by leakages corresponding to the buckling given by the user. The burn-up scheme may be carried out by a transport equation with intermediate stages without flux reevaluation or by a predictor-corrector scheme. (Author).

26309 (INIS-mf–12758, pp. 552-556) **RA-6 reactor's probabilistic safety evaluation. Identification and selection of starting events.** Kay, J. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Seguridad Radiologica y Nuclear); Chiossi, C.; Felizia, E.; Vallerga, H.; Kalejman, G.; Navarro, R.; Caruso, G.J. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

A summary of the 'Identification and selection of starting events' stage of the previous probabilistic safety evaluation of RA-6 reactor is presented. This evaluation was performed to verify if the safety criteria required for the licensing of RA-6 are met and to promote the diffusion of its meaning and usefulness with educational purposes. At this stage the starting events of RA-6 are determined and the probability that such events occur is calculated. The identification and selection of starting events is performed in two steps: determination of proposed starting events and determination of postulated starting events. The proposed starting events are determined by means of the master logic diagram (MLD) method, while the postulated starting events are obtained by grouping the proposed starting events. The simplifying hypothesis required for the application of MLD to the reactor are also formulated. The probability that the proposed and postulated starting events occur is afterwards calculated, adopting different fault models, in accordance with the nature of events that are considered. Conservative hypothesis on the characteristics of these events and the uncertainty of parameter values of those models are also formulated. The numerical values of the above mentioned probabilities are obtained by giving the parameters suitable values that are extracted from specialized publications. (Author).

26310 (JAERI-M–93-038) **Annual report of the JMTR: The JMTR operation and technical development No. 6 (fiscal 1991).** Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 140p. (In Japanese). Order Number DE93508344. Source: OSTI; NTIS; INIS.

The JMTR (Japan Materials Testing Reactor) is a 50 MW tank type reactor, cooled and moderated by light water. It started the irradiation service in 1970. The JMTR has been providing high neutron flux in core positions for irradiation testing of reactor materials and fuels, and for radioisotopes production. In fiscal 1991, the JMTR operated of 5.1 cycles as planned. Extensive irradiation tests, including power ramping tests on LWR fuel rods were carried out. Furthermore, the development of new irradiation techniques and post irradiation techniques such as re-instrumentation of a thermocouple to an irradiated fuel rod and tube joint utilized the shape memory alloys were continued. The study for irradiation performance on fusion reactor blanket was started. For the JMTR core conversion to low-enriched uranium (LEU), the safety review was completed by the competent authorities, and the license was issued. The core of the JMTR will be converted to LEU fuels in 1993. (author).

26311 (JINR-R-3-91-512) **The IBR-2 reactor transients due to uncontrolled decreasing of the auxiliary movable reflector velocity.** Popov, A.K. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1991. [6p.] (In Russian). Order Number DE93629736. Source: OSTI; NTIS (US Sales Only); INIS.

The periodic pulsed reactor transients are calculated at decreasing of the auxiliary movable reflector (AMR) velocity by uncontrolled uncoupling of the AMR with the main movable reflector. At once after breaking the intense drop of power pulse energy takes place. Then in several seconds very large power pulse can appear with its energy several times more than the energy before breaking. The calculations confirm that the appearance of the dangerous large power pulses can be avoided if there is emergency safety system, which acts at decreasing of power pulse energy. 2 refs.; 5 figs.; 2 tabs.

26312 (NMP–92-05) **University Loaned Normal Uranium Slug Disposition Study: University survey responses: Predecisional draft.** Becker, G.W. Jr. Westinghouse Savannah River Co., Aiken, SC (United States). 1 Sep 1992. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93009891. Source: OSTI; NTIS; GPO Dep.

During the 1950's and 1960's, the Atomic Energy Commission loaned rejected natural uranium slugs from the Savannah River Site to United States universities for use in subcritical assemblies. Currently, there are sixty-two universities holding 91,798 slugs, containing about 167 metric tons of natural uranium. It was originally planned that the universities would return the material to Fernald when they no longer required it. Fernald has not received slugs since it was shut down in 1988. The Department of Energy's Office of Weapons and Materials Planning requested that the Planning Support Group develop information to assist them in facilitating the return of the unwanted slugs to one or more of their facilities and develop alternatives for the ultimate disposition of this material. This supplemental report to the University Loaned Normal Uranium Slug Disposition Study documents responses to and summarizes the results of a survey of fifty-eight universities. University contacts and survey responses covering loaned slug descriptions, historical information, radiological data, current status, and plans and schedules are documented.

26313 (SR/H–528) **Historical aspects of plant assistance to Hanford Engineer Works.** Acken, M.F.; Peterson, J.H.; Smith, D.M.; Kay, W.C.; Struthers, G.W.; Faris, B.F.; Apple, R.S.; Curtis, R.E.; Wende, C.W.J.; Gast, P.F.; Dahlen, P.A.; Osterloh, R.H.; Woods, W.K.; Schier, R.J.; Smith, E.A. Hanford Engineer Works, Richland, WA (United States). [1946]. 164p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. Order Number DE93012422. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Although start-up conditions for Hanford were defined on the basis of information obtained at the Metallurgical Laboratory (Chicago) and at Clinton Laboratories, it was anticipated that the plant would require technical assistance in revising and standardizing operating procedures and in following the miscellaneous routine and special projects and tests connected with the various stops of the process. The Separations Engineering (200 Technical) Division of the Technical Department was assigned the responsibility of carrying out this plant assistance work in the 200 Areas. Four groups were established to handle this work, three of these to assist in problems arising in the Canyon (221), Concentration (224), and Isolation (231) Buildings and the fourth to deal with problems arising in connection with equipment design and performance in all three buildings. This memorandum reviews the work of the plant assistance groups in the Canyon and Concentration Buildings, from their inception in September 1944 to August 1, 1945.

26314 (SR/H–541) **[Hanford Department histories]: Accounting Department, Part 1.** [Plant histories]. Hanford Engineer Works, Richland, WA (United States). [1946]. 119p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. Order Number DE93013442. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Accounting Department of the Hanford Engineer Works has been responsible for all accounting and related activities essential to the operation of the plant and of Richland Village. This work has been divided between two primary Divisions: Accounting and Clerical. In common with the practice at other DuPont-operated war plants, the work of the Accounting Division has been that usually handled for commercial plants by the Wilmington Office. This Division also performed certain phases of Construction Division accounting during plant and Village erection. The size and unique character of this project have increased the scope of most of these accounting functions, and have created additional activities not usually encountered (e.g., recruitment advances, Village accounts receivable, etc.). The Clerical Division has been responsible for the time office, purchasing, and the other clerical and related services essential to normal plant operations. This document, Book one, Part one, of the eighteen volume DuPont History reviews the development of the Accounting Department from the start of its work at Hanford (March 1943) to July 1, 1945.

26315 (SR/H–543) **[Project 98-1086, Technical scopes of work, electrical].** [Engineering Department project files]. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). This scope of work describes in detail facilities and equipment for which the Process Group is responsible. It includes process and mechanical equipment in Buildings 770-U, 771-U and machine tools to be provided by Process in Building 704-U. Also listed are over-all service requirements for emergency electric power, water systems and air systems. Drawings, sketches and other process and mechanical data furnished for estimating purposes are listed.

This document, Chapter 13 of "The Hanford Story" discusses the production of Uranium 235 and the research, development, and design of the electromagnetic process utilized in this production.

26329 (WHC-SA–1934) **Operator involvement in plant decision making and self-assessment.** Dugwyler, R.L. Westinghouse Hanford Co., Richland, WA (United States). Apr 1993. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930538–2: 4. conduct of operations workshop: the key to continued success, Tampa, FL (United States), 4-6 May 1993). Order Number DE93016479. Source: OSTI; NTIS; INIS; GPO Dep.

The Fast Flux Test Facility has a history of innovation that goes beyond mere compliance with DOE Conduct of Operations. This innovation fosters excellence at all levels of daily operations. Consistent operator input into management decision making and self-assessment has helped to produce an Operations staff that is proud and professional. A group of operators drafted the Fast Flux Test Facility Operations Professional Code, which serves as a benchmark for excellence. Operator committees have proposed changes as varied as the twelve hour rotating shift schedule, a streamlined reactor operator qualification program and an improved new hire training process. The changes succeeded because they had widespread operator acceptance. Similar committees have initiated staffing and qualification changes to help Operations cope with transforming the plant from an operating to a standby status. Standing committees such as the Operations Review Team (1985 to 1988) and the Operations Performance Enhancement Committee (1990 to present) have provided operators with an independent review of root causes and corrective actions to events. This occurs both for in-plant and other DOE facility events, through a Lessons Learned Program. The committees have also had "management's ear" regarding suggestions for improving safety, efficiency and operator performance. As the Fast Flux Test Facility goes from an operating plant to a plant in standby, one of the primary changes will be to maintain operator interest in continual improvement. The Operations Performance Enhancement Committee can assist in this pursuit – a pursuit of excellence. The purpose of this paper is to relate the successes of operator involvement at the Fast Flux Test Facility from the viewpoint of an Operations Engineer.

26330 (WSRC-MS–92-518) **RELAP5/MOD3 analysis of a heated channel in downflow.** Dimenna, R.A.; Qureshi, Z.H.; Boman, A.L. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930778–3: 1993 RELAP5 international users meeting, Boston, MA (United States), 6-9 Jul 1993). Order Number DE93013575. Source: OSTI; NTIS; INIS; GPO Dep.

The onset of flow instability (OFI) is a significant phenomenon affecting the determination of a safe operating power limit in the Savannah River Site production reactors. Tests performed at

Columbia University for a single tube with uniform axial and azimuthal heating have been analyzed with RELAP5/NPR, Version 0, a version of RELAP5/MOD3. The tests include water flow rates from 3.2 x 10^{-4} - 2.1 x 10^{-3} m^3/s (5 - 33 gpm), Reynolds numbers from 30,000 - 400,000, and surface heat fluxes from 0 - 3.2 x 10^6 w/m^2 (0 - 1,000,000 Btu/hr- ft^2). Pressure drop versus flow rate curves were mapped for both fixed pressure boundary conditions and fixed flow boundary conditions. RELAP5/MOD3 results showed fair agreement with data for both types of boundary conditions, and good internal consistency between calculations using the two different types of boundary conditions. Under single-phase unheated conditions, the code overpredicted the pressure drop by 22 - 34%. Under single-phase heated conditions, the overprediction increased to as much as 55%. For those tests where two-phase conditions were observed at the channel exit, RELAP5 predicted lower flows than seen in the tests before voiding occurred.

26331 (WSRC-MS–93-182) **Acceptance criteria for reactor coolant pumps and valves.** Gupta, N.K.; Miller, R.F.; Sindelar, R.L. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930702–19: Pressure vessels and piping conference, Denver, CO (United States), 25-29 Jul 1993). Order Number DE93012758. Source: OSTI; NTIS; INIS; GPO Dep.

Each of the six primary coolant loop systems of the Savannah River Site (SRS) production reactors contains one reactor coolant pump, one PUMP suction side motor operated valve, and other smaller valves. The pumps me double suction, double volute, and radially split type pumps. The valves are different size shutoff and control valves rated from ANSI B16.5 construction class 150 to class 300. The reactor coolant system components, also known as the process water system (PWS), are classified as nuclear Safety Class I components. These components were constructed in the 1950's in accordance with the then prevailing industry practices. No uniform construction codes were used for design and analysis of these components. However, no pressure boundary failures or bolting failures have ever been recorded throughout their operating history. Over the years, the in-service inspection (ISI) was limited to visual inspection of the pressure boundaries, and surface and volumetric examination of the pressure retaining bolts. Efforts are now underway to implement ISI requirements similar to the ASME Section XI requirements for pumps and valves. This report discusses the new ISI requirements which also call for volumetric examination of the pump casing and valve body welds.

26332 (WSRC-MS–93-262) **Development of flaw evaluation and acceptance procedures for flaw indications in the cooling water system at the Savannah River Site K Reactor.** Tandon, S. (Westinghouse Electric Corp., Pittsburgh, PA (US)); Bamford, W.H.; Cowfer, C.D.; Ostrowski, R. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930702–45: Pressure vessels and piping conference, Denver, CO (United States), 25-29 Jul 1993). Order Number DE93014731. Source: OSTI; NTIS; GPO Dep.

This paper describes the methodology used in determining the criteria for acceptance of inspection indications in the K-Reactor Cooling Water System at the Savannah River Plant. These criteria have been developed in a manner consistent with the development of similar criteria in the ASME Code Section 11 for commercial light water reactors, but with a realistic treatment of the operating conditions in the cooling water system. The technical basis for the development of these criteria called "Acceptance Standards" is contained in this paper. A second portion of this paper contains the methodology used in the construction of flaw evaluation charts which have been developed for each specific line size in the cooling water system. The charts provide the results of detailed fracture mechanics calculations which have been completed to determine the largest flaw which can be accepted in the cooling water system without repair. These charts are designed for use in conjunction with inservice inspections of the cooling water system, and only require inspection results to determine acceptability.

26333 (WSRC-MS–93-287) **Effect of power on demand surface and flow instability for annular geometry fuel elements with upflow of coolant.** Smith, A.C. (Westinghouse Savannah River Co., Aiken, SC (United States)); Blake, J.E; Childerson, M.T.; Ohrn, T.R.; Privette, R.M. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930601–19: American Nuclear Society (ANS) annual meeting, San Diego, CA (United States), 20-24 Jun 1993). Order Number DE93013826. Source: OSTI; NTIS; GPO Dep.

Analytical studies of the effects of power on flow instability in parallel channels with upward flow of coolant, have predicted that the Ledinegg flow instability, encountered as flow is decreased for typical operating power levels, would not be experienced at low power levels. For a system in which the flow of coolant is upward, the increased buoyancy enhances flow in the channel, so that as the void increases, the overall pressure loss decreases. Under this condition, flow instability does not occur. Testing was performed to confirm the predicted behavior and to provide data for benchmarking of computer codes used for predicting the performance of reactor fuel elements. The demand curves traced in these tests are part of the multidimensional demand surface for the test apparatus. The basic coordinates of this surface are flow rate, pressure drop and power. A fourth significant independent variable is system pressure, so that the behavior of the system is represented by a family of Δp-flow-power surfaces for each pressure level. This testing confirmed that, at low power levels comparable to decay heat removal power, the buoyancy effects may become dominant so that the demand curve for the fuel assembly turns downward and flow instability will not occur.

26334 (WSRC-RP–91-1148) **Technical bases of the second generation SARIS core model (Task Number: 90-008-0).** Gregory, M.V. Westinghouse Savannah River Co., Aiken, SC (United States). Nov 1991. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014752. Source: OSTI; NTIS; INIS; GPO Dep.

A methodology has been developed to rigorously derive the constants in the Savannah River Simulator (SARIS) core model from detailed, charge-design, diffusion theory solutions. This methodology is intended to replace the ill-defined, ad hoc iterative process used in the past to generate these constants. Along the development path, three shortcomings of the current core model were identified and corrected. The updated core model with revised constants is termed the second generation core model. In addition, changes in the decay heat and delayed neutron precursor models are also recommended, all in the interest of improving simulator neutronics fidelity.

26335 (WSRC-TR–92-96) **Reactor safety research section probability of heat exchanger leaks.** Cramer, D.S.; Shine, E.P.; Copeland, W.J. Westinghouse Savannah River Co., Aiken, SC (United States). Feb 1992. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014753. Source: OSTI; NTIS; GPO Dep.

Three heat exchangers (HXs) were changed out after the December 1991 leak of Process Water to the Savannah River. This leaves 6 of the original 304 stainless steel heat exchangers which will remain in K-Reactor for restart. This report discusses SRS site specific data which were used to estimate the probability of a leak within a one-year period as a function of leak rate and root cause in these six heat exchangers in conjunction with six new heat exchangers presently in service in K-Reactor. Based on several assumptions and statistical models, SRS data indicate that the total probability of a leak occurring during a one-year period in K-Reactor with 6 original (304 stainless steel) and 6 new (316-L or SEA-CURE) heat exchangers, with a leak rate greater than 20, 40 or 90 pounds/hr, is 0.013, 0.004 or 0.0005, respectively.

26336 (WSRC-TR–92-439) **Further code validation of Technical Specification Bases.** Apperson, C.E.; Webb, R.L. Westinghouse Savannah River Co., Aiken, SC (United States). Sep 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014751. Source: OSTI; NTIS; INIS; GPO Dep.

Personnel from the Applied Physics Group (APG) and from the Reactor Technology Section devised the K-14 reactor restart test program. The primary purpose of that program was to acquire data

which could be used to further validate the computer codes which supported the Technical Specification Bases. The test program was highly successful and a large amount of useful data was obtained. DOE has now requested the schedule and plan for the additional code validation activities. A response to DOE was made in which an outline of WSRC's (Westinghouse Savannah River Co.) planned activities was presented, but specifics were not discussed. This memorandum is intended to provide additional details on these activities. The WSRC plan consists of five major activities. The first activity is to catalog and document the measured data. The second activity is to investigate the radial and axial neutron flux distributions. The results from this task will complement the analyses being performed in the final three activities: steady state reactivity effects, transient reactivity effects, and planned an unplanned shutdowns. Work on these activities is scheduled to be completed by the end of the fiscal year 1993.

26337 (ANL/NPR–92/6) **Molten fuel fragmentation experiments: Stage 2: New Production Reactors Program.** Gabor, J.D.; Purviance, R.T.; Cassulo, J.C.; Spencer, B.W. Argonne National Lab., IL (United States). Jul 1992. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93012143. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Severe accident questions for the Heavy Water Reactor – New Production Reactor (HWR-NPR) include the interaction of the water in the lower plenum with the melt relocating from the core. Important concerns in the melt-water interaction are the depth of pour stream penetration, breakup, quenching, hydrogen generation, and characteristics of the pour stream fragments. The goal of the current experiments discussed in this report was to identify the controlling breakup mechanisms of the flowing pour stream of aluminum alloy melt in water. The fragment size and condition (solidified or molten) can be modeled in analysis of coolability from an understanding of the breakup mechanics. The extent of fragmentation affects other phenomena; i.e., heat transfer, chemical reactions and potential for energetic steam explosions. Therefore various parameters such as alloy composition, water temperature, pour stream velocity, and pour stream geometry resulting from NPR-HWR design considerations which would affect these phenomena were investigated.

26338 (ANL/NPR–92/7) **Fuel/target relocation experiments: New Production Reactors Program.** Spencer, B.W.; Sienicki, J.J.; Gunther, W.H.; Cassulo, J.C. Argonne National Lab., IL (United States). Sep 1992. 160p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93013052. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A series of eleven tests were performed to address the melting, relocation, and channel plugging behavior of surrogate aluminum fuel and target material in essentially full scale elemental subchannel geometry. These tests were based on conditions in a loss of coolant accident (LOCA), with scram, in the reference reactor system which was the Ebasco-design 2500 MWt HWR-NPR and Mark 22I-3 reference fuel assembly design. Test conditions involving channel wall melting ignored the expected functioning of reactor safety features and the exceedingly small probability of an accident progressing to the point of fuel melting. The topic of fuel/target separation during fuel tube melting (by downward draining of melting fuel leaving standing intact, colder target tubes) is a key safety issue for HWR-NPR, because sequence calculations indicate a resulting reactivity transient. This experimental study was planned to focus on fuel melting behavior, especially with respect to involvement of the targets, as a database for modeling in the RELOCATE detailed model and the SAS-HWR integrated accident analysis code.

26339 (ANL/NPR–92/16) **Modeling and analysis of melt pool heat transfer and vessel bottom head dissolution: New Production Reactors Program.** Tan, M.J. (Argonne National Lab., IL (United States)); Cho, D.H.; Cheung, F.B. Argonne National Lab., IL (United States). Sep 1992. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93010995. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Under conditions of failure of the emergency core cooling system in a heavy water production reactor, core meltdown may occur and molten fuel may come into contact with the bottom head of the reactor vessel. A computer code, ACCORD, that features the use of a directional effective thermal conductivity in modeling natural convection in heat-generating liquid pools and the use of a mass transfer coefficient in modeling dissolution of the interior surface of a reactor bottom head into a melt pool has been developed to track the thermal behavior of a melt pool formed inside the bottom head of a reactor vessel and to study the interactions between the melt pool and the bottom head. The discretization scheme for the melt pool is designed specifically for liquid pools bounded from below by curved surfaces. Heat transfer in the melt pool is treated as axisymmetric and twodimensional while that in the bottom head is treated as locally one-dimensional. The temperature distributions in the melt pool and in the bottom head are solved sequentially instead of simultaneously and are coupled through boundary conditions at the interface between the melt pool and the bottom head. The basic equations and their solution method for the ACCORD code are described. The capability of the code is illustrated with calculations using parameters pertaining to the reactor vessel in the original EBASCO full-size-plant design.

26340 (ANL/NPR–93/3) **Estimation of long period ground motions for use in analysis of base-isolated structures: New Production Reactors Program.** Abrahamson, N.A. (Woodward-Clyde Consultants, Pasadena, CA (United States)). Argonne National Lab., IL (United States); Woodward-Clyde Consultants, Pasadena, CA (United States). Sep 1990. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93010894. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Typically, engineering seismology has been concerned with high frequency ground motions. High frequency motions are very complex and are often assumed to be stochastic. Physically, high frequency ground motions are generated by the acceleration or deceleration of the rupture front and by variations in the amount of slip along the fault. The propagation of high frequency waves (including scattering) is affected by the small scale heterogeneities in the crust. Therefore, the high frequency ground motions are sensitive to the fine details of the source process as well as the fine details of the geologic structure. As a result, ground motion simulations using theoretical models based on gross models of the source process and geologic structure do not reliably predict high frequency motions. Successful simulations of high frequency ground motions use stochastic, empirical or semi-empirical models. This report discusses seismic base isolation which is a design method that shifts the response of a structure from high frequencies to moderate or low frequencies depending on the type of isolator used. This shift reduces the effect of the peak acceleration on the structure, but increases the effect of the peak velocity and peak displacements. Therefore, for base-isolated structures, the concern is with the long period ground motions.

26341 (ANL/NPR–93/6) **The foaming of U-Al fuel under simulated reactor accident conditions: New Production Reactors Program.** Neimark, L.A.; Liu, Y.Y. Argonne National Lab., IL (United States). Mar 1993. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93012377. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses postirradiation heating tests which were conducted on segments of UAl_4-Al dispersion fuel plates clad with Al to scope the foaming behavior of such fuels during beyond-design-basis accident scenarios. Four tests investigated maximum temperature, ramp rate, and duration with a liquid phase as parameters in foam formation and stability, Real-time fission-gas release was also determined during the foaming process. Ramp-rate had the most noticeable effect on foam formation and collapse.

26342 (BNL–48697) **Status of nuclear safety R&D in the US.** Bari, R.A. Brookhaven National Lab., Upton, NY (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9304123–1: 8. Korean Atomic Industrial Forum/Korean Nuclear Society/OKAEA annual conference, Seoul (Korea, Republic of), 20-21 Apr 1993). Order Number DE93012523. Source: OSTI; NTIS; INIS; GPO Dep.

The status of nuclear safety research and development in the US is presented with particular emphasis on work performed by Brookhaven National Laboratory. The nuclear safety program in the US encompasses safety of the current generation of operating commercial reactors, safety-related design of the next generation of advanced reactors, and safety activities for the reactors owned by the US Department of Energy. The broad topical areas of safety research include (but are not limited to) severe accidents, reliability/risk assessment, human performance, thermal-hydraulics, plant aging, seismic, and structural studies.

26343 (BNL-NUREG–47879) **Analysis of accidents during the mid-loop operating state at a PWR.** Jo, J.; Lin, C.C.; Mufayi, V.; Neymotin, L.; Nimnual, S. Brookhaven National Lab., Upton, NY (United States). [1992]. 13p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-921007–25: 20. water reactor safety information meeting, Bethesda, MD (United States), 21-23 Oct 1992). Order Number DE93013342. Source: OSTI; NTIS; INIS; GPO Dep.

Studies suggest that the risk of severe accidents during low power operation and/or shutdown conditions could be a significant fraction of the risk at full power operation. The Nuclear Regulatory Commission has begun two risk studies to evaluate the progression of severe accidents during these conditions: one for the Surry plant, a pressurized water reactor (PWR), and the other for the Grand Gulf plant, a boiling water reactor (BWR). This paper summarizes the approach taken for the Level 2/3 analysis at Surry for one plant operating state (POS) during shutdown. The current efforts are focussed on evaluating the risk when the reactor is at mid-loop; this particular POS was selected because of the reduced water inventory and the possible isolation of the loops. The Level 2/3 analyses are conditional on core damage having occurred. Initial results indicate that the conditional consequences can indeed be significant; the defense-in-depth philosophy governing the safety of nuclear power plants is to some extent circumvented because the containment provides only a vapor barrier with no capability for pressure holding, during this POS at Surry. However, the natural decay of the radionuclide inventory provides some mitigation. There are essentially no predicted offsite prompt fatalities even for the most severe releases.

26344 (BNL-NUREG–48657) **Human Factors Engineering Review Model for advanced nuclear power reactors.** O'Hara, J. (Brookhaven National Lab., Upton, NY (United States)); Higgins, J.; Goodman, C.; Galletti, G.: Eckenrode, R. Brookhaven National Lab., Upton, NY (United States). [1993]. 6p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930401–17: Meeting on nuclear plant instrumentation, control and man-machine interface technologies, Oak Ridge, TN (United States), 18-21 Apr 1993). Order Number DE93012525. Source: OSTI; NTIS; INIS; GPO Dep.

One of the major issues to emerge from the initial design reviews under the certification process was that detailed human-systems interface (HSI) design information was not available for staff review. To address the lack of design detail issue. The Nuclear Regulatory Commission (NRC) is performing the design certification reviews based on a design process plan which describes the human factors engineering (HFE) program elements that are necessary and sufficient to develop an acceptable detailed design specification. Since the review of a design process is unprecedented in the nuclear industry. The criteria for review are not addressed by current regulations or guidance documents and. therefore, had to be developed. Thus, an HFE Program Review Model was developed. This paper will describe the model's rationale, scope, objectives, development, general characteristics. and application.

26345 (BNL-NUREG–48890) **Aging assessments: A strategy for today and the future.** Lofaro, R.; Taylor, J. Brookhaven National Lab., Upton, NY (United States). [1993]. 7p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930807–1: 16. biennial conference on reactor operating experience, Upton, NY (United States), 16-18 Aug 1993). Order Number DE93014302. Source: OSTI; NTIS; INIS; GPO Dep.

Aging assessments have been performed for selected nuclear power plant systems under the NRC's Nuclear Plant Aging Research (NPAR) program. These assessments are typically performed by evaluating industry wide data from national databases. The results provide useful information on the typical aging characteristics for the system studied. However, due to the differences in operation and environmental conditions, as well as maintenance practices between plants, the results of the industry wide data analyses may not be representative of specific plant conditions. Therefore, it would be beneficial for utilities to perform their own plant specific aging assessments. This paper discusses an approach that can be used by the utilities to perform an aging assessment of their plant systems. The methodology is based on that used to perform the NPAR system studies at Brookhaven National Laboratory. The reasons for performing a plant specific system level aging assessment are discussed, along with the sources of information that should be used. In addition, a methodology for performing the assessment is presented. Sample charts and tables are included to illustrate the expected products. A discussion is included on what to look for in the available data, how to interpret the findings, and how to implement the results.

26346 (CEA-DES–115) **Reactivity accidents of Super Phenix and EFR reactors.** Natta, M. (CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Dept. d'Evaluation de Surete); Lauret, P.; Moreau, J. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Dept. d'Evaluation de Surete. Mar 1993. [22p.] (In French). (CONF-9209365–: Conference on reactivity accidents of nuclear reactors, Kiev (Russian Federation), 28 Sep - 3 oct 1992). Order Number DE93631525. Source: OSTI; NTIS (US Sales Only); INIS.

In this presentation of reactivity accidents on Super Phenix and EFR project we look first the causes of reactivity insertions and the precautions taken to evade these accidents, then the scenario of the envelope of accidents consequences giving a core fusion and defining the containment.

26347 (CONF-921007–30) **Auxiliary feedwater system aging study.** Kueck, J.D. Oak Ridge National Lab., TN (United States). [1992]. 12p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From 20. water reactor safety information meeting; Bethesda, MD (United States); 21-23 Oct 1992. Order Number DE93015187. Source: OSTI; NTIS; INIS; GPO Dep.

The Phase 1 Auxiliary Feedwater (AFW) System Aging Study, NUREG/CR-5404 V1, focused on how and to what extent the various AFW system component types fail, how the failures have been and can be detected, and on the value of current testing requirements and practices. This follow-on study, which will be provided in full in NUREG/CR-5404 V2, provides a closure to the Phase 1 Study. For each of the component types and for the various sources of component failure identified in the Phase 1 Study, the methods of failure detection were designated and tabulated and the following findings became evident: Instrumentation and Control (I and C) related failures dominated the group of failures that were detected during demand conditions; many of the potential failure sources not detectable by the current monitoring practices were related to the I and C portion of the system; some component failure modes are actually aggravated by conventional test methods; and several important system functions did not undergo any function verification test. The goal of this follow-on study was to categorize and evaluate the deficiencies in testing identified by Phase 1 and to make specific recommendations for corrective action. In addition, this study presents discussions of alternate, state-of-the-art test methods, and provides a proposed Auxiliary Feedwater Pump test at normal operating pressure which should do much to verify system operability while eliminating degradation.

26348 (CONF-921007–31) **Identification and assessment of BWR in-vessel severe accident mitigation strategies.** Hodge, S.A.; Kress, T.S.; Cleveland, J.C.; Petek, M. Oak Ridge National

Lab., TN (United States). [1992]. 19p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From 20. water reactor safety information meeting; Bethesda, MD (United States); 21-23 Oct 1992. Order Number DE93015520. Source: OSTI; NTIS; INIS; GPO Dep.

This paper briefly describes the results of work carried out in support of the US Nuclear Regulatory Commission Accident Management Research Program to evaluate the effectiveness and feasibility of current and proposed strategies for BWR severe accident management. These results are described in detail in the just-released report Identification and Assessment of BWR In-Vessel Severe Accident Mitigation Strategies, NUREG/CR-5869, which comprises three categories of findings. First, an assessment of the current status of accident management strategies for the mitigation of in-vessel events for BWR severe accident sequences is combined with a review of the BWR Owners' Group Emergency Procedure Guidelines (EPGs) to determine the extent to which they currently address the characteristic events of an unmitigated severe accident. Second, where considered necessary, new candidate accident management strategies are proposed for mitigation of the late-phase (after core damage has occurred) events. Finally, two of the four candidate strategies identified by this effort are assessed in detail. These are (1) preparation of a boron solution for reactor vessel refill should control blade damage occur during a period of temporary core dryout and (2) containment flooding to maintain the core debris within the reactor vessel if the injection systems cannot be restored.

26349 (DOE/FTR–93011934) **[INEL factfinding mission to Russia, Ukraine, and eastern Europe regarding nuclear safety]: Foreign trip report, February 1–19, 1993.** Bickel, J.H.; Modro, S.M. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1993. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93011934. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses travel to Russia, Ukraine, and Eastern Europe regarding nuclear safety. In order to obtain better information regarding nuclear safety technical assistance needs in these countries. A series of technical meetings were arranged between the INEL and various organizations in these countries. The trip was partially funded by the IAEA Division of Nuclear Safety (Bickel at VNIIAES) and from internal INEL funds.

26350 (EGG-GEO–10304-Vol.1) **Earthquake ground motion evaluations for the proposed new production reactor at the Idaho National Engineering Laboratory: Volume 1, Deterministic evaluation.** Wong, I. (Woodward-Clyde Consultants, Oakland, CA (United States)); Hemphill-Haley, M.; Sawyer, T.; Youngs, R.; Makdisi, F.; Wells, D.; Coppersmith, K.; Stark, C.; Castro, R.; Chiou, S.; Silva, W.; Bruhn, R.; Daning, Wu.; Kneupfer, P. EG and G Idaho, Inc., Idaho Falls, ID (United States); Woodward-Clyde Consultants, Oakland, CA (United States); Geomatrix Consultants, Inc., San Francisco, CA (United States); Pacific Engineering and Analysis, Inc., El Cerrito, CA (United States). Jun 1992. 298p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93012164. Source: OSTI; NTIS (US Sales Only); GPO Dep.

At the request of EG&G Idaho, Inc. and the Department of Energy, this Volume I report describes and summarizes a deterministic earthquake ground motion evaluation for the proposed New Production Reactor (NPR) at the Idaho National Engineering Laboratory (INEL). The purpose of this evaluation is to provide input into a proposed INEL-NPR Integrated Safety Analysis Report (ISAR) as specified in US Nuclear Regulatory Commission (US-NRC) Regulatory Guide 1.70 for Section 2.5.2 "Vibratory Ground Motion." It should be noted, however, that the intent of the deterministic studies is to address only the most significant earthquake sources relevant to the NPR site rather than all potential seismic sources within 200 miles as required in Regulatory Guide 1.70. It is recognized that other earthquake sources may pose a hazard to the INEL such as the Lost River fault, source of the 1983 moment magnitude (M_w) 6.8 Borah Peak earthquake.

26351 (EGG-M–92638) **Probabilistic based design rules for intersystem LOCAS in ABWR piping.** Ware, A.G. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Wesley, D.A. EG and G Idaho, Inc., Idaho Falls, ID (United States); EQE Engineering Consultants, Irvine, CA (United States). [1993]. 16p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-930702–23: Pressure vessels and piping conference, Denver, CO (United States), 25-29 Jul 1993). Order Number DE93013673. Source: OSTI; NTIS; INIS; GPO Dep.

A methodology has been developed for probability-based standards for low-pressure piping systems that are attached to the reactor coolant loops of advanced light water reactors (ALWRs) which could experience reactor coolant loop temperatures and pressures because of multiple isolation valve failures. This accident condition is called an intersystem loss-of-coolant accident (IS-LOCA). The methodology was applied to various sizes of carbon and stainless steel piping designed to advanced boiling water reactor (ABWR) temperatures and pressures.

26352 (EGG-M–93032) **The NUCLARR databank: Human reliability and hardware failure data for the nuclear power industry.** Reece, W.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 6p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-930243–7: Data banks for risk assessment workshop, Augusta, GA (United States), 2-3 Feb 1993). Order Number DE93013674. Source: OSTI; NTIS; INIS; GPO Dep.

Under the sponsorship of the US Nuclear Regulatory Commission (NRC), the Nuclear Computerized Library for Assessing Reactor Reliability (NUCLARR) was developed to provide human reliability and hardware failure data to analysts in the nuclear power industry. This IBM-compatible databank is contained on a set of floppy diskettes which include data files and a menu-driven system for locating, reviewing, sorting, and retrieving the data. NUCLARR contains over 2500 individual data records, drawn from more, than 60 sources. The system is upgraded annually, to include additional human error and hardware component failure data and programming enhancements (i.e., increased user-friendliness). NUCLARR is available from the NRC through project staff at the INEL.

26353 (EGG-M–93123) **Interpretation of risk significance of passive component aging using probabilistic structural analysis.** Phillips, J.H. (TENERA, L.P., Idaho Falls, ID (United States)); Atwood, C.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 10p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-930702–22: Pressure vessels and piping conference, Denver, CO (United States), 25-29 Jul 1993). Order Number DE93013664. Source: OSTI; NTIS; INIS; GPO Dep.

The probabilistic risk assessments (PRAs) being developed at most nuclear power plants to calculate the risk of core damage generally focus on the possible failure of active components. Except as initiating events, the possible failure of passive components is given little consideration. The NRC is sponsoring a project at INEL to investigate the risk significance of passive components as they age. For this project, we developed a technique to calculate the failure probability of passive components over time, and demonstrated the technique by applying it to a weld in the auxiliary feedwater (AFW) system. A decreasing yearly rupture rate for this weld was calculated instead of the increasing rupture rate trend one might expect. We attribute this result to infant mortality; that is, most of those initial flaws that will eventually lead to rupture will do so early in life. This means that although each weld in a population may be wearing out, the population as a whole can exhibit a decreasing rupture rate. This observation has implications for passive components in commercial nuclear plants and other facilities where aging is a concern. For the population of passive components that exhibit a decreasing failure rate, risk increase is not a concern. The next step of the work is to identify the attributes that contribute to this decreasing rate, and to determine any attributes that would contribute to an increasing failure rate and thus to an increased risk.

26354 (EGG-NERD–8648) **Probability of the iodine spike release rate during an SGTR.** Adams, J.P.; Atwood, C.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1989. 70p. Sponsored by Nuclear Regulatory Commission, Washington, DC

(United States). DOE Contract AC07-76ID01570. Order Number DE93017396. Source: OSTI; NTIS; INIS; GPO Dep.

The Nuclear Regulatory Commission (NRC) requires utilities to determine the response of a pressurized water reactor (PWR) to a steam generator tube rupture (SGTR) as part of the safety analysis for the plant. The SGTR analysis includes assumptions regarding the presence of fission product iodine in the reactor coolant resulting from iodine spikes. Due to uncertainties in the consequences, the NRC has designated this class of accident as a generic safety issue. To get a better understanding of iodine spiking, reactor trip and associated radiochemistry data were collected from 26 PWRs. These data were compared against validation criteria to determine their applicability to an investigation of the magnitude of an iodine spike following a reactor trip. The applicable data and the results of a statistical analysis are presented. Conclusions are made concerning the magnitude of an iodine spike during an SGTR and these are compared with the NRC analysis criteria. The conclusion is made that the iodine release rate specified for analysis of an SGTR is overly conservative and could be reduced significantly while still maintaining adequate protection to the public. The formalism required by the Standard Review Plan in determining the release rate is judged to be inappropriate and an absolute release rate, based on plant electric power, is recommended as a replacement. A value of 0.710 Ci/h*MW(e) is recommended for consideration as a replacement for the current iodine release rate specification for an SGTR with coincident iodine spike.

26355 (EGG-RTAP–10627) **Technical evaluation report, TMI action NUREG-0737 (II.D.1), relief and safety valve testing, Comanche Peak, Unit 2, Docket No. 50-446.** Fineman, C.P. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jan 1993. 35p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. Source: OSTI; NTIS; INIS.

In the past, safety and relief valves installed in the primary coolant system of light water reactors have performed improperly. As a result, the authors of NUREG-0578 (TMI-2 Lessons Learned Task Force Status Report and Short-Term Recommendations) and, subsequently, NUREG-0737 (Clarification of TMI Action Plan Requirements) recommended development and completion of programs to do two things. First, the programs should reevaluate the functional performance capabilities of pressurized water reactor safety, relief, and block valves. Second, they should verify the integrity of the pressurizer safety and relief valve piping systems for normal, transient, and accident conditions. This report documents the review of those programs by EG&G Idaho, Inc. Specifically, this report documents the review of the Comanche Peak, Unit 2, Applicant response to the requirements of NUREG-0578 and NUREG-0737. This review found the Applicant provided an acceptable response reconfirming they met General Design Criteria 14, 15, and 30 of Appendix A to 10 CFR 50 for the subject equipment.

26356 (INIS-mf–12758, pp. 120-124) **Statistical inference of the nuclear accidents occurrence number for the next decade.** Felizia, E.R. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Seguridad Radiologica y Nuclear). Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

This paper aims to give a response using the classical statistical and bayesian inference techniques regarding the common characteristic in the Harrisburg and Chernobyl nuclear accidents: in both reactors, core fusion occurred. In relation to the last mentioned techniques, the most recent developments were applied, based on the decision theory of uncertainty; among others, the principle of maximum entropy. Besides, as a preliminar information on the accidents occurrence frequency with core fusion, the German risk analysis results were used. The estimations predicted for the next decade an average between one or two accidents with core fusion and low possibilities for the 'no accident' event in the same period. (Author).

26357 (JAERI-M–93-027) **Implementation of JAERI's reflood model into TRAC-PF1/MOD1 code.** Akimoto, Hajime (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Ohnuki, Akira; Murao, Yoshio. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1993. 72p. (In Japanese). Order Number DE93508318. Source: OSTI; NTIS; INIS.

Selected physical models of REFLA code, that is a reflood analysis code developed at JAERI, were implemented into the TRAC-PF1/MOD1 code in order to improve the predictive capability of the TRAC-PF1/MOD1 code for the core thermal hydraulic behaviors during the reflood phase in a PWR LOCA. Through comparisons of physical models between both codes, (1) Murao-Iguchi void fraction correlation, (2) the drag coefficient correlation acting to drops, (3) the correlation for wall heat transfer coefficient in the film boiling regime, (4) the quench velocity correlation and (5) heat transfer correlations for the dispersed flow regime were selected from the REFLA code to be implemented into the TRAC-PF1/MOD1 code. A method for the transformation of the void fraction correlation to the equivalent interfacial friction model was developed and the effect of the transformation method on the stability of the solution was discussed. Through assessment calculation using data from CCTF (Cylindrical Core Test Facility) flat power test, it was confirmed that the predictive capability of the TRAC code for the core thermal hydraulic behaviors during the reflood can be improved by the implementation of selected physical models of the REFLA code. Several user guidelines for the modified TRAC code were proposed based on the sensitivity studies on fluid cell number in the hydraulic calculation and on node number and effect of axial heat conduction in the heat conduction calculation of fuel rod. (author).

26358 (JAERI-M–93-045) **Assessment of TRAC-BF1 1D reflood model with CCTF and SCTF data.** Akimoto, Hajime (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Ohnuki, Akira; Murao, Yoshio; Abe, Yutaka. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 137p. Order Number DE93508320. Source: OSTI; NTIS; INIS.

Post test calculations for six selected Cylindrical Core Test Facility (CCTF) and Slab Core Test Facility (SCTF) tests were performed to assess the core thermal hydraulic models of the TRAC-BF1 code during the reflood in a PWR LOCA. A special version of the TRAC code was developed at JAERI by implementing the constitutive package of the TRAC-BF1 code into the TRAC-PF1 code for this assessment. The TRAC-BF1 model predicted well the void fraction at either bottom or top part of the core and overpredicted the void fraction at the center part of the core in the CCTF and SCTF tests performed under so-called licensing conditions. The TRAC-BF1 model overpredicted the clad temperatures at the center part of the core. The TRAC-BF1 model predicted a jump of void fraction where the flow pattern transition between the bubbly/slug flow and the annular/dispersed flow regimes occurred. The jump caused the water mass flow rate to be unstable and resulted in the overprediction of the void fraction at the center part of the core. It was also found that the TRAC-BF1 film boiling model underestimated the heat transfer coefficient in the vicinity of the quench front and caused the quench front propagation to be delayed. These assessment results suggest the following areas should be improved in future to apply the TRAC-BF1 code to the reflood in a PWR LOCA: (1) Core hydraulic model where flow pattern transition occurs, (2) Core heat transfer model in the film boiling regime, especially for the dependence on the distance from the quench front. (author).

26359 (LA-UR–93-807) **Recent developments in the TWODANT system of codes for criticality safety.** Parsons, D.K.; Alcouffe, R.E.; Marr, D.R.; Brinkley, F.W. Los Alamos National Lab., NM (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930907–2: ANS topical meeting on physics and methods in criticality safety, Nashville, TN (United States), 19-23 Sep 1993). Order Number DE93010716. Source: OSTI; NTIS; GPO Dep.

The application of deterministic, discrete ordinates codes to criticality safety problems can be a very useful complement to analyses performed using Monte Carlo methods. This is especially so if there is a need for dose or flux maps of the system or if

configuration perturbations are to be studied. In these latter two situations, it is difficult to obtain reliable Monte Carlo results due to statistical effects. Deterministic calculations are also useful as an independent check and verification of Monte Carlo results. The TWODANT system of discrete ordinates codes' has recently been enhanced for criticality safety analysis. In addition to ONEDANT, TWODANT, and TWOHEX, the TWODANT system now includes TWODANT/GQ and THREEDANT. These two new code modules expand the applicability of the TWODANT system. These new capabilities will be demonstrated on a representative sample of nuclear criticality safety problems. First, TWODANT/GQ and THREEDANT will be described. Salient features of each code module will be discussed. Calculational results obtained by each will be presented and compared with each other and with Monte Carlo results. Finally, some guidelines for the effective use of the TWODANT system on criticality applications will be given.

26360 (NUREG/CR–5305-Vol.2-Pt.1) **Integrated Risk Assessment for the LaSalle Unit 2 Nuclear Power Plant: Phenomenology and Risk Uncertainty Evaluation Program (PRUEP): Appendices A–C: Volume 2, Part 1.** Brown, T.D. (Sandia National Labs., Albuquerque, NM (United States)); Payne, A.C. Jr.; Miller, L.A.; Shiver, A.W.; Higgins, S.J.; Sype, T.T.; Johnson, J.D.; Chanin, D.I. 26362 (NUREG/CR–5759) **Risk analysis of highly combustible gas storage, supply, and distribution systems in PWR plants.** Simion, G.P. (Science Applications International Corp., Albuquerque, NM (United States)); VanHorn, R.L.; Smith, C.L.; Bickel, J.H.; Sattison, M.B.; Bulmahn, K.D. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Issue Resolution; EG and G Idaho, Inc., Idaho Falls, ID (United States). Jun 1993. 220p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (EGG–2640). Source: OSTI; NTIS; INIS; GPO.

This report presents the evaluation of the potential safety concerns for pressurized water reactors (PWRs) identified in Generic Safety Issue 106, Piping and the Use of Highly Combustible Gases in Vital Areas. A Westinghouse four-loop PWR plant was analyzed for the risk due to the use of combustible gases (predominantly hydrogen) within the plant. The analysis evaluated an actual hydrogen distribution configuration and conducted several sensitivity studies to determine the potential variability among PWRs. The sensitivity studies were based on hydrogen and safety-related equipment configurations observed at other PWRs within the United States. Several options for improving the hydrogen distribution system design were identified and evaluated for their effect on risk and core damage frequency. A cost/benefit analysis was performed to determine whether alternatives considered were justifiable based on the safety improvement and economics of each possible improvement.

26363 (NUREG/CR–5966) **A simplified model of aerosol removal by containment sprays.** Powers, D.A. (Sandia National Labs., Albuquerque, NM (US)); Burson, S.B. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Issue Resolution; Sandia National Labs., Albuquerque, NM (United States). Jun 1993. 318p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-76DP00789. (SAND–92-2689). Source: OSTI; NTIS; INIS; GPO.

Spray systems in nuclear reactor containments are described. The scrubbing of aerosols from containment atmospheres by spray droplets is discussed. Uncertainties are identified in the prediction of spray performance when the sprays are used as a means for decontaminating containment atmospheres. A mechanistic model based on current knowledge of the physical phenomena involved in spray performance is developed. With this model, a quantitative uncertainty analysis of spray performance is conducted using a Monte Carlo method to sample 20 uncertain quantities related to phenomena of spray droplet behavior as well as the initial and boundary conditions expected to be associated with severe reactor accidents. Results of the uncertainty analysis are used to construct simplified expressions for spray decontamination coefficients. Two variables that affect aerosol capture by water droplets are not treated as uncertain; they are (1) 'Q', spray water flux into the containment, and (2) 'H', the total fall distance of spray droplets. The choice of values of these variables is left to the user since they are plant and accident specific. Also, they can usually be ascertained with some degree of certainty. The spray decontamination coefficients are found to be sufficiently dependent on the extent of decontamination that the fraction of the initial aerosol remaining in the atmosphere, m_f, is explicitly treated in the simplified expressions. The simplified expressions for the spray decontamination coefficient are given. Parametric values for these expressions are found for median, 10 percentile, and 90 percentile values in the uncertainty distribution for the spray decontamination coefficient. Examples are given to illustrate the utility of the simplified expressions to predict spray decontamination of an aerosol-laden atmosphere.

26364 (NUREG/CR–5983) **Safety aspects of forced flow cooldown transients in Modular High Temperature Gas-Cooled Reactors.** Kroger, P.G. (Brookhaven National Lab., Upton, NY (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; Brookhaven National Lab., Upton, NY (United States). May 1993. 14p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (BNL-NUREG–52355). Source: OSTI; NTIS; INIS; GPO.

During some of the design basis accidents in Modular High Temperature Gas Cooled Reactors (MHTGRs), the main Heat Transport System (HTS) and the Shutdown Cooling System n removed by the passive Reactor (SCS) are assumed to have failed. Decay heat is the Cavity Cooling System (RCCS) only. If either forced flow cooling system becomes available during such a transient, its restart could significantly reduce the down-time. This report used the THATCH code to examine whether such restart, during a period of elevated core temperatures, can be accomplished within safe limits for fuel and metal component temperatures. If the reactor is scrammed, either system can apparently be restarted at any time, without exceeding any safe limits. However, under unscrammed conditions a restart of forced cooling can lead to recriticality, with fuel and metal temperatures significantly exceeding the safety limits.

26365 (NUREG/CR–6013) **Methods used for the treatment of non-proportionally damped structural systems.** Conoscente, J.P. (EQE Engineering Consultants, San Francisco, CA (United States)); Maslenikov, O.R.; Johnson, J.J. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; EQE Engineering Consultants, San Francisco, CA (United States). May

1993. 89p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

Non-proportional or non-classical damping is defined as a form of viscous damping that introduces coupling between the undamped modal coordinates of motion. Such problems have practical applications in the dynamic analysis of soil-structure systems, structure-equipment systems, and structural systems made of materials with different energy dissipation capacities, which is applicable to seismic analysis of nuclear power plants. Presented in this report is a review of the methods most commonly used in structural analysis for the solution of the dynamic response of systems with non-proportional damping. Both rigorous and approximate methods are described. Since rigorous methods usually require large computational efforts, approximate methods using undamped mode shapes are often preferred. In the study described here, the accuracy of three approximate methods was evaluated for three benchmark problems, with various parametric variations. Results were compared with the exact solution for different combinations of structural properties. Based on these results, conclusions and recommendations are presented for the use of the selected approximate methods.

26366 (NUREG/CR–6061) **Determination of the bias in LOFT fuel peak cladding temperature data from the blowdown phase of large-break LOCA experiments.** Berta, V.T. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Hanson, R.G.; Johnsen, G.W.; Schultz, R.R. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1993. 106p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (EGG–2610). Source: OSTI; NTIS; INIS; GPO.

Data from the Loss-of-Fluid Test (LOFT) Program help quantify the margin of safety inherent in pressurized water reactors during postulated loss-of-coolant accidents (LOCAs). As early as 1979, questions arose concerning the accuracy of LOFT fuel rod cladding temperature data during several large-break LOCA experiments. This report analyzes how well externally-mounted fuel rod cladding thermocouples in LOFT accurately reflected actual cladding surface temperature during large-break LOCA experiments. In particular, the validity of the apparent core-wide fuel rod cladding quench exhibited during blowdown in LOFT Experiments L2-2 and L2-3 is studied. Also addressed is the question of whether the externally-mounted thermocouples might have influenced cladding temperature. The analysis makes use of data and information from several sources, including later, similar LOFT Experiments in which fuel centerline temperature measurements were made, experiments in other facilities, and results from a detailed FRAP-T6 model of the LOFT fuel rod. The analysis shows that there can be a significant difference (referred to as bias) between the surface-mounted thermocouple reading and the actual cladding temperature, and that the magnitude of this bias depends on the rate of heat transfer between the fuel rod cladding and coolant. The results of the analysis demonstrate clearly that a core-wide cladding quench did occur in Experiments L2-2 and L2-3. Further, it is shown that, in terms of peak cladding temperature recording during LOFT large-break LOCA experiments, the mean bias is 11.4 $\pm$ 16.2K (20.5 $\pm$ 29.2° F). The best-estimate value of peak cladding temperature for LOFT LP-02-6 is 1,104.8 K. The best-estimate peak cladding temperature for LOFT LP-LB-1 is 1284.0 K.

26367 (NUREG/IA–0092) **Assessment of RELAP5/MOD2 computer code against the Net Load Trip Test data from Yong-Gwang, Unit 2.** Arne, N. (Korea Electric Power Co., Taejeon (KR)); Cho, S.; Lee, S.H. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Korea Electric Power Co., Taejon (Korea, Republic of); Korea Inst. of Nuclear Safety, Taejon (Korea, Republic of). Jun 1993. 64p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

The results of the RELAP5/MOD2 computer code simulation for the 100% Net Load Trip Test in Yong-Gwang Unit 2 are analyzed here and compared with the plant operation data. The control systems for the control rod, feedwater, steam generator level, steam dump, pressurizer level and pressure are modeled to be functioned automatically until the power level decreases below 30% nuclear power. A sensitivity study on control rod worth was carried out and it was found that variable rod worth should be used to achieve good prediction of neutron power. The results obtained from RELAP5/MOD2 simulation agree well with the plant operating data and it can be concluded that this code has the capability in analyzing the transient of this type in a best estimate means.

26368 (NUREG/IA–0095) **RELAP5 assessment using LSTF test data SB-CL-18.** Lee, S. (Korea Inst. of Nuclear Safety, Taejon (Korea, Republic of)); Chung, B.D.; Kim, H.J. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Korea Inst. of Nuclear Safety, Taejon (Korea, Republic of). May 1993. 216p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

A 5 % cold leg break test, run SB-CL-18, conducted at the Large Scale Test Facility (LSTF) was analyzed using the RELAP5/MOD2 Cycle 36.04 and the RELAP5/MOD3 Version 5m5 codes. The test SB-CL-18 was conducted with the main objective being the investigation of the thermal-hydraulic mechanisms responsible for the early core uncovery, including the manometric effect due to an asymmetric coolant holdup in the steam generator upflow and downflow side. The present analysis, carried out with the RELAP5/MOD2 and MOD3 codes, demonstrates the code's capability to predict, with sufficient accuracy, the main phenomena occurring in the depressurization transient, both from a qualitative and quantitative point of view. Nevertheless, several differences regarding the evolution of phenomena and affecting the timing order have been pointed out in the base calculations. The sensitivity study on the break flow and the nodalization study in the components of the steam generator U-tubes and the cross-over legs were also carried out. The RELAP5/MOD3 calculation with the nodalization change resulted in good predictions of the major thermal-hydraulic phenomena and their timing order.

26369 (NUREG/IA–0104) **RELAP5/MOD3 assessment using the Semiscale 50% Feed Line Break test S-FS-11.** Lee, E.J. (Korea Inst. of Nuclear Safety, Taejon (Korea, Republic of)); Chung, B.D.; Kim, H.J. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Korea Inst. of Nuclear Safety, Taejon (Korea, Republic of). Jun 1993. 175p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

The RELAP5/MOD3 5m5 code was assessed using the 1/1705 volume scaled Semiscale 50% Feed Line Break (FLB) test S-FS-11. Test S-FS-11 was designed in three phases: (a) blowdown phase, (b) stabilization phase, and (c) refill phase. The first objective was to assess the code applicability to 50% FLB situation, the second was to evaluate the FSAR conservatisms regarding SG heat transfer degradation, steam line check valve failure, break flow state, and peak primary system pressure, and the third was to validate the EOP effectiveness. The code was able to simulate the major T/H parameters except for the two-phase break flow and the secondary convective heat transfer rate. The two-phase break flow had still deficiencies. The current boiling heat transfer rate was developed from the data for flow inside of a heated tube, not for flow around heated tubes in a tube bundle. Results indicated that the assumption of 100% heat transfer until the liquid inventory depletion was not conservative, the failed affected steam generator main steam line check valve assumption was not either conservative, the measured break flow experienced all types of flow conditions, the relative proximity to the 110% design pressure limit was conservative. The automatic actions during the blowdown phase were effective in mitigating the consequences. The stabilization operation performed by operator actions were effective to permit natural circulation cooldown and depressurization. The voided secondary refill operations also verified the effectiveness of the operations while recovering the inventory in a voided steam generator.

26370 (NUREG/IA–0120) **Assessment of the turbine trip transient in Cofrentes NPP with TRAC-BF1.** Castrillo, F. (Hidroelectrica Espanola, Madrid (Spain)); Gomez, A.; Gallego, I. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Union Electrica, SA, Madrid (Spain). Jun 1993. 65p. Sponsored by Nuclear Regulatory Commission,

Washington, DC (United States). (EST-SIAN–22). Source: OSTI; NTIS; INIS; GPO.

This report presents the results of the assessment of TRAC-BF1 (G1-J1) code with the model of C. N. Cofrentes for simulation of the transient originated by the manual trip of the main turbine. C. N. Cofrentes is a General Electric designed BWR/6 plant, with a nominal core thermal power of 2894 Mwt, in commercial operation since 1985, owned and operated by Hidroelectrica Española, S. A. The plant incorporates all the characteristics of BWR/6 reactors, with two turbine driven FW pumps. As a result of this assessment a model of C. N. Cofrentes has been developed for TRAC-BF1 that fairly reproduces operational transient behavior of the plant. A special purpose code was generated to obtain reactivity coefficients, as required by TRAC-BF1, from the 3D simulator.

26371 (NUREG/IA–0123) **Application of full power blackout for C. N. Almaraz with RELAP5/MOD2.** Lechas, A.L. (C. N. Almaraz I y II, Madrid (ES)). Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Central Nuclear de Almaraz, Madrid (Spain). Jun 1993. 98p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (ICSP–AL-BOUT-R). Source: OSTI; NTIS; INIS; GPO.

The analysis group of Almaraz Nuclear Power Plant has developed a model of the plant with RELAP 5/MOD.2/36:04. This model is the result of the work-experience on the code RELAP 5/MOD.1/ that was the standard code during the period 1984–1989. Different solutions were adopted in the network to implement the RELAP 5/ MOD.1/CY computer code. The first complete calculation of an accident (normal power blackout) was undertaken. All calculations presented in this report were performed on a computer CDC Cyber 180/830. The CPU time versus real time event was 22.6.

26372 (ORNL/FTR–4256) **Travel to collect data on boiling water reactor (BWR) instability events in Sweden and Spain: Trip report, May 4–14, 1992.** March-Leuba, J.A. Oak Ridge National Lab., TN (United States). 26 May 1992. 15p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011083. Source: OSTI; NTIS (US Sales Only); GPO Dep.

There is a high level of activity in the area of boiling water reactor (BWR) stability in Europe, which is due in part to the higher number of instability events that have been observed in Europe. (Only three instabilities have been observed in the United States.) Most of these European events have occurred during special stability testing, but some of them have occurred unexpectedly and have resulted in either automatic or manual scrams. In the United States two events have been unexpected (LaSalle and Vermont Yankee), and one (Vermont Yankee) occurred during special stability tests. In general, BWR stability is considered in Europe to be more an operational problem than a safety problem. Significant emphasis is placed on having operator awareness and appropriate instrumentation so that unstable oscillations will be easily recognized and suppressed. Most Swedish BWRs use (or plan to use in the near future) stability monitors to avoid possible areas of instability during startup and load-following operations.

26373 (ORNL/NPR–92/64) **Pipe break testing of primary loop piping similar to Department of Energy's New Production Reactor-Heavy Water Reactor: Final report.** Poole, A.B.; Battiste, R.L.; Clinard, J.A. Oak Ridge National Lab., TN (United States). Jan 1993. 159p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013423. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report provides information about and results from specific tests completed at Oak Ridge National Laboratory (ORNL) in support of the Department of Energy's (DOE's) New Production Reactor-Heavy Water Reactor (NPR-HWR) program. The report also provides detailed analytical studies completed by Battelle Columbus Laboratory and Argonne National Laboratory. All of this information is presented in a demonstrationthat the primary piping of the NPR-HWR, with its relatively moderate temperature and pressure should not suffer an instantaneous double-ended-guillotine-break (DEGB) under design basis loadings and conditions.

26374 (SAND–90-0234, pp. 1.1-1.5) **Introduction.** Bergeron, K.D. Sandia National Labs., Albuquerque, NM (United States). Jan 1993. (NPRW-SA–0234). In *Ex-vessel severe accident review for the Heavy Water New Production Reactor.* 372p. Order Number DE93010608. Source: OSTI; NTIS (US Sales Only).

The Introduction provides an overview of the Department of Energy's plans for design, construction, and startup of a Heavy Water New Production Reactor (HW-NPR) and or a Modular High Temperature Gas-Cooled New Production Reactor (MHTGR-NPR) and the need to review applicable accident information for plants of this type. The goals of the report are reviewed. The organization of the eight chapters of this report is outlined. Phenomena addressed include molten core-concrete interactions, fuel-coolant interactions, and gas combustion. 3 refs., 1 fig.

26375 (SAND–90-0234, pp. 2.1-2.10) **A rationale for studying severe accidents.** Bergeron, K.D. Sandia National Labs., Albuquerque, NM (United States). Jan 1993. (NPRW-SA–0234). In *Ex-vessel severe accident review for the Heavy Water New Production Reactor.* 372p. Order Number DE93010608. Source: OSTI; NTIS (US Sales Only).

This chapter assesses the value of an NPR severe accident program and explores the importance of the program with regard to the appropriate level, structure, and timing of the DOE/NP severe accident program. Section 2 reviews the unique needs of the NPR severe accident program. Section 3 describes the users of information generated by the NPR severe accident program. Section 4 evaluates the impact of regulatory uncertainty on long-range planning of the NPR severe accident program. Section 6 describes the interface of the NPR severe accident program with design activities. Section 6 discusses the interface of probabilistic risk assessment with accident information. Section 7 summarizes the important points presented in the chapter. 1 ref.

26376 (SAND–90-0234, pp. 3.1-3.19) **In-vessel melt progression in the HW-NPR.** Gauntt, R.O.; Kelly, J.E. Sandia National Labs., Albuquerque, NM (United States). Jan 1993. (NPRW-SA–0234). In *Ex-vessel severe accident review for the Heavy Water New Production Reactor.* 372p. Order Number DE93010608. Source: OSTI; NTIS (US Sales Only).

Perhaps the greatest uncertainty with respect to melt progression in the HW-NPR is the ultimate choice for the fuel design. It is expected that in-vessel melt progression processes will have a major effect on fission product release and containment loads. Hence, understanding the processes associated with core melt progression is extremely important for understanding severe accidents in the HWR. Some methods of designing-out recriticality potential as well as some alternative mitigating strategies are discussed. This chapter reviews the SRS melt progression technology base in Section 2, focusing on LWR/HW-NPR differences. Hydrogen generation in U/Al fuels is described is Section 3. In Section 4, debris coolability and lower vessel wall melt-through are assessed. Section 5 summarizes the findings of the chapter and draws conclusions regarding in-vessel melt progression in the HW-NPR. 23 refs., 2 figs., 1 tab.

26377 (SAND–90-0234, pp. 4.1-4.117) **Prevention and mitigation of core debris interactions with concrete.** Powers, D.A.; Bradley, D.R.; Chu, T.Y.; Copus, E.R. Sandia National Labs., Albuquerque, NM (United States). Jan 1993. (NPRW-SA–0234). In *Ex-vessel severe accident review for the Heavy Water New Production Reactor.* 372p. Order Number DE93010608. Source: OSTI; NTIS (US Sales Only).

The behavior of core materials once they have escaped the reactor coolant system and have begun to interact with structural material in a reactor containment during a severe accident hypothesized to occur in the HW-NPR is discussed in this chapter. The discussions concentrate on the interactions of core materials with concrete. A principal thrust of this chapter is to provide bases for the design of the HW-NPR that prevents or mitigates core material interactions outside the reactor coolant system and thus eliminates or mitigates the loads on the reactor containment and the radioactivity releases associated with the interactions. A summary review of the findings of the light-water reactor (LWR) research on ex-vessel core debris interactions is presented as is a review of results obtained to date in the work sponsored by the Savannah

River Site on ex-vessel interactions of debris. A review of strategies for mitigating or preventing ex-vessel core debris interaction is presented. The chapter concludes with a discussion of two options that appear to be attractive means for preventing or mitigating core debris interactions with concrete in the HW-NPR. Data needed to implement these options are described in the final section of the chapter. 133 refs., 47 figs., 10 tabs.

26378 (SAND–90-0234, pp. 5.1-5.65) **Molten fuel-coolant interactions.** Berman, M.; Beck, D.F.; Nelson, L.S.; Young, M.F. Sandia National Labs., Albuquerque, NM (United States). Jan 1993. (NPRW-SA–0234). In *Ex-vessel severe accident review for the Heavy Water New Production Reactor.* 372p. Order Number DE93010608. Source: OSTI; NTIS (US Sales Only).

When a hot liquid (fuel) comes into contact with a cold liquid (coolant), a variety of different fuel-coolant interactions (FCIs) can occur. For the heavy water reactor (HWR), the coolant of interest is water. The FCIs can range from quiescent boiling to explosive fragmentation of the fuel and rapid steam generation. This section discusses past FCI research in general and also as it pertains to the safety of the New Production Reactor (NPR) under severe accident conditions. Some mitigative and preventative strategies that might enhance NPR safety without requiring extensive research to reduce phenomenological uncertainties are also discussed. 158 refs., 8 figs., 1 tab.

26379 (SAND–90-0234, pp. 6.1-6.54) **Hydrogen distribution and combustion.** Tieszen, S.R.; Sherman, M.P.; Slezak, S.E.; Stamps, D.W.; Tills, J.L. Sandia National Labs., Albuquerque, NM (United States). Jan 1993. (NPRW-SA–0234). In *Ex-vessel severe accident review for the Heavy Water New Production Reactor.* 372p. Order Number DE93010608. Source: OSTI; NTIS (US Sales Only).

Hydrogen combustion is important because it can affect both safety-related equipment and containment integrity. The focus of this chapter is on hydrogen distribution and combustion that is relevant to the HW-NPR. Conditions are described when hydrogen combustion can occur. The consequences of hydrogen combustion are assessed. Various strategies for eliminating the threat of combustion or mitigating its consequences are discussed. 131 refs., 14 figs.

26380 (SAND–90-0234, pp. 7.1-7.31) **Additional containment threats and mitigation strategies.** Williams, D.C.; Breeding, R.J. Sandia National Labs., Albuquerque, NM (United States). Jan 1993. (NPRW-SA–0234). In *Ex-vessel severe accident review for the Heavy Water New Production Reactor.* 372p. Order Number DE93010608. Source: OSTI; NTIS (US Sales Only).

This chapter briefly discusses several issues pertinent to containment and mitigation. Sections 2 and 3 are devoted to discussions of accident sequences in which the containment is defeated at the outset, either because the accident sequence involves a release path bypassing the containment or because the containment is not isolated properly. Section 4 discusses threats posed by missiles which could be generated in certain energetic events: recriticality, steam explosions, and hydrogen detonations. Section 5 discusses FCI-driven fuel dispersal phenomena, in which steam generated by fuel-coolant interactions (FCI) may disperse fuel debris into the containment and thereby heat and pressurize the containment atmosphere and/or threaten containment liner integrity by direct contact with hot debris. Section 6 discusses slow overpressurization of the containment, which may eventually occur if containment heat removal is lost for long time periods (days). In each of these sections mitigation strategies are briefly addressed. Section 7 discusses the concept of designing the containment so that relatively rigorous deterministic analysis can demonstrate that it will withstand any credible severe accident threat, without resort to probabilistic arguments. Finally, Section 8 summarizes the most important points developed in this chapter. 27 refs., 3 figs.

26381 (SAND–90-0234, pp. 8.1-8.35) **Computer codes and accident analysis.** Bergeron, K.D.; Kelly, J.E. Sandia National Labs., Albuquerque, NM (United States). Jan 1993. (NPRW-SA–0234). In *Ex-vessel severe accident review for the Heavy Water New Production Reactor.* 372p. Order Number DE93010608. Source: OSTI; NTIS (US Sales Only).

This chapter deals with calculational methods in general; hence there there is no specific phenomenological focus, and no discussion of mitigative design strategies. The goal of this chapter is to take advantage of many years of experience gained in the past concerning severe accident computer code development and use, and to provide guidelines for those who develop NPR severe accident codes, those who apply the codes to specific accident analyses, and those who must interpret the significance of the results. Section 2 describes the most important uses of these codes and explains the logic behind the "two-tier" approach for code development. Section 3 is a brief discussion of the impact of uncertainty on the development and use of codes. Section 4 explains the purpose and structure of systematic procedures to control the development, distribution, and use of these codes as they evolve in time. Finally, Section 5 illustrates how accident analyses using system-level severe accident codes can qualitatively change perceptions about dominant effects, sometimes predicting results which are initially counter-intuitive, but upon inspection result from synergistic effects which can only be seen in an integrated analysis. 22 refs., 3 figs., 2 tabs.

26382 (SAND–91-1544) **NPR/FCI EXO-FITS experiment series report.** Rightley, M.J.; Beck, D.F.; Berman, M. Sandia National Labs., Albuquerque, NM (United States). Jan 1993. 148p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (NPRW-SA–91-3). Order Number DE93013950. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses a test series investigating intermediate-scale ex-vessel fuel-coolant interaction (FCI) phenomena for aluminum melt materials which has been completed at Sandia National Laboratories (SNL), Albuquerque, NM. These tests were conducted for the Department of Energy's Office of New Production Reactors as part of the HWR Engineering Development Plan (EDP, WBS element 1.9.3-1). This document is the final report on the first phase of testing at SNL and represents completion of milestone 1.9.3 C of the EDP. The experiments, known as the NPR/FCI EXO-FITS Test Series, were conducted between 10 May 1990 and 30 January 1991 at the Explosive Dynamics Laboratory at SNL.

26383 (SAND–92-2774) **Containment loads scoping calculations for severe nuclear reactor accidents.** Williams, D.C. (Sandia National Labs., Albuquerque, NM (United States)); Gregory, J.J.: Tieszen, S.R.; Tills, J.L. Sandia National Labs., Albuquerque, NM (United States); Tills (Jack) and Associates, Inc., Albuquerque, NM (United States). Feb 1993. 185p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (NPRW-SA–90-5). Order Number DE93015608. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Scoping calculations are reported for the assessment of containment loads in the Heavy Water-New Production Reactor. Classes of loads considered include both design basis accident loads and severe accident loads. In the former category, loads following a large-break loss-of-coolant accident and loads associated with long-term heat removal with only passive heat removal systems operating are analyzed. Potential severe accident loads considered include blast loads associated with hydrogen detonation, rapid pressurization loads associated with energetic events, and long-term thermal and pressure loads with only passive heat removal systems operating following a severe accident. The latter include analysis of alternate designs with a refractory-lined dry cavity. The analyses presented include parametric and phenomenological sensitivity studies that provide insights into how the loads depend upon certain details of the accidents and/or the plant design. Given additional design-specific information, which was not available at the time of this study, the results will provide insight as to the severity of the containment loads that may result from specific accident sequences. In addition, the results provide some guidance as to how certain design features can be used to minimize the threat to containment integrity associated with loads of the types considered.

26384 (SAND–93-1067C) **Preliminary nuclear safety assessment of the NEPST (Topaz II) space reactor program.** Marshall, A.C. Sandia National Labs., Albuquerque, NM (United States). [1993]. 8p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9305179–1: 2. specialists conference and short course on

thermionic energy conversion, Goteborg (Sweden), 3-7 May 1993). Order Number DE93012853. Source: OSTI; NTIS; INIS; GPO Dep.

The United States (US) Strategic Defense Initiative Organization (SDIO) decided to investigate the possibility of launching a Russian Topaz II space nuclear power system. A preliminary nuclear safety assessment was conducted to determine whether or not a space mission could be conducted safely and within budget constraints. As part of this assessment, a safety policy and safety functional requirements were developed to guide both the safety assessment and future Topaz II activities. A review of the Russian flight safety program was conducted and documented. Our preliminary nuclear safety assessment included a number of deterministic analyses, such as; neutronic analysis of normal and accident configurations, an evaluation of temperature coefficients of reactivity, a reentry and disposal analysis, an analysis of postulated launch abort impact accidents, and an analysis of postulated propellant fire and explosion accidents. Based on the assessment to date, it appears that it will be possible to safely launch the Topaz II system in the US with a modification to preclude water flooded criticality. A full scale safety program is now underway.

26385 (UCRL-JC–110275-Rev.1) **A human reliability analysis of the University of New Mexico's AGN- 201M nuclear research reactor: Revision 1.** Brumburgh, G.P. (Lawrence Livermore National Lab., CA (United States)); Heger, A.S. Lawrence Livermore National Lab., CA (United States). 15 Oct 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9301102–3-Rev.1: American Nuclear Society (ANS) meeting, Clearwater, FL (United States), 27 Jan 1993). Order Number DE93012475. Source: OSTI; NTIS; INIS; GPO Dep.

During 1990–1991, a probabilistic risk assessment was conducted on the University of New Mexico's AGN-201M nuclear research reactor to address the risk and consequence of a maximum hypothetical release accident. The assessment indicated a potential for consequential human error to precipitate Chis scenario. Subsequently, a human reliability analysis was performed to evaluate the significance of human interaction on the reactor's safety systems. This paper presents the results of that investigation.

26386 (WINCO–11908) **SHEAN (Simplified Human Error Analysis code) and automated THERP.** Wilson, J.R. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. (CONF-9302122–1: GOCO database meeting, Augusta, GA (United States), 2-3 Feb 1993). Order Number DE93014904. Source: OSTI; NTIS; INIS; GPO Dep.

One of the most widely used human error analysis tools is THERP (Technique for Human Error Rate Prediction). Unfortunately, this tool has disadvantages. The Nuclear Regulatory Commission, realizing these drawbacks, commissioned Dr. Swain, the author of THERP, to create a simpler, more consistent tool for deriving human error rates. That effort produced the Accident Sequence Evaluation Program Human Reliability Analysis Procedure (ASEP), which is more conservative than THERP, but a valuable screening tool. ASEP involves answering simple questions about the scenario in question, and then looking up the appropriate human error rate in the indicated table (THERP also uses look-up tables, but four times as many). The advantages of ASEP are that human factors expertise is not required, and the training to use the method is minimal. Although not originally envisioned by Dr. Swain, the ASEP approach actually begs to be computerized. That WINCO did, calling the code SHEAN, for Simplified Human Error ANalysis. The code was done in TURBO Basic for IBM or IBM-compatible MS-DOS, for fast execution. WINCO is now in the process of comparing this code against THERP for various scenarios. This report provides a discussion of SHEAN.

26387 (WSRC-MS–92-370-Rev.1) **A comparison of response spectrum and direct integration analysis methods as applied to a nuclear component support structure: Revision 1.** Bryan, B.J.; Flanders, H.E. Jr. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930702–16-Rev.1: Pressure vessels and piping conference, Denver, CO (United States), 25-29 Jul 1993). Order Number DE93011778. Source: OSTI; NTIS; INIS; GPO Dep.

Seismic qualification of Class I nuclear components is accomplished using a variety of analytical methods. This paper compares the results of time history dynamic analyses of a heat exchanger support structure using response spectrum and time history direct integration analysis methods. Dynamic analysis is performed on the detailed component models using the two methods. A nonlinear elastic model is used for both the response spectrum and direct integration methods. A nonlinear model which includes friction and nonlinear springs, is analyzed using time history input by direct integration. The loads from the three cases are compared.

26388 (WSRC-MS–93-048) **The application of modern safety criteria to restarting and operating the USDOE K-Reactor.** Dimenna, R.A.; Taylor, G.A.; Brandyberry, M.D. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9306189–1: NE '93: 4th annual scientific and technical conference of the Nuclear Society: nuclear energy and human safety, Nizhni Novgorod (USSR), 28 Jun - 2 jul 1993). Order Number DE93016175. Source: OSTI; NTIS; INIS; GPO Dep.

The United States Department of Energy's (USDOE's) K-reactor, a defense production reactor located at the Savannah River Site in Aiken, South Carolina, was shut down in the summer of 1988 for safety upgrades to bring it into conformance with modern safety standards prior to restart. Over the course of the succeeding four years, all aspects of the 35-year old reactor, including hardware, operations, and analysis, were upgraded to ensure that the reactor could operate safely according to standards similar to those applied to modern nuclear reactors. This paper describes the decision making processes by which issues were identified, priorities assigned, and analysis improved to enhance reactor safety. Special emphasis is given to the probabilistic risk assessment (PRA) decision making processes used to quantify the risks and consequences of operating the K-reactor, the analytical hierarchy process (AHP) used to identify key phenomena, and modifications made to the RELAP5 computer code to make it applicable to K-reactor analysis. The success of the project was demonstrated when the K-reactor was restarted in the summer of 1992.

26389 (WSRC-RP–92-445) **Functional Analysis and Thermal-Hydraulics Program Plan.** Paik, I.K.; Lord, R.; Parks, B. Westinghouse Savannah River Co., Aiken, SC (United States). 27 Mar 1992. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93016136. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to set forth the Program Plan for the Functional Analysis and Thermal-Hydraulics (FA&TH) Program (herein after referred to as the "Program") for the 5 year period covering fiscal years 1992 thru 1996. Specifically, the actions planned by the Safety Analysis Group (SAG) of the Reactor Safety Research Section within SRTC will be identified, defined, and a schedule and resource projection presented. This document will be used by the Reactor Safety Research Section management as the baseline definition for the Program's scope, schedule and cost. Annual budget and staffing requests will be submitted based on this approved baseline. Status reporting and progress monitoring will be performed against this approved baseline. This Program plan will be revised as needed to reflect the changes that come about due to Program redirection. The Program's primary mission is to provide further assurance that the Savannah River Site K-Reactor is designed, modified, operated and maintained in a safe, cost-effective manner through application of functional analysis methodology and continued development of thermal hydraulic support capabilities. It is envisioned that the Program will continue throughout the operating life of K-Reactor and have a permanent staff of eight: one lead and seven engineers. The Program has two primary elements; (1) functional analysis, and (2) thermal-hydraulics. Functional analysis is the first element of the formal Systems Engineering Process. Systems Engineering methodology is commonly applied in both commercial and military programs, particularly where the needs of the program involve complex interrelationships between hardware,

software, personnel, and support facilities. It has been extensively used in development of military systems, and in the commercial sector in the development of designs for nuclear power reactors.

26390 (WSRC-RP–92-720) **Steam explosion analysis in support of the SRS reactor safety assessment.** Vonderfecht, B.E.; Smith, D.C. Westinghouse Savannah River Co., Aiken, SC (United States). 9 Oct 1992. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014750. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the application of two steam explosion models in support of the Probabilistic Risk Assessment (PRA) for the Savannah River Reactors. Theoretical models are required to estimate steam explosion yields in terms of kinetic energy, pressure shock and steam generated by the event. These quantities are used in the PRA to determine fission product barrier integrity in the reactor confinement following a hypothetical steam explosion. The basic preconditions for a steam explosion are that hot molten material come into contact with water, and that the material's temperature be high enough to both support film boiling at its surface, and remain molten until an explosion is initiated. In a number of PRA accident sequences, aluminum-uranium debris will be hot enough to participate in a steam explosion. The high pressure vapor produced, the shock waves, and the kinetic energy of material can all do destructive work on structures surrounding the explosion site. Fuel melting is possible during several postulated severe accident scenarios for the SRS reactors. In many cases, water will exist in the reactor primary system and/or on the confinement building floor. Steam explosions must be characterized by a few significant parameters that can be addressed in the PRA. These parameters are the quantity of steam produced, and the amount of mechanical work performed. The model must be both computationally efficient and realistic. The present work employs a bounding model based on the assumption of thermodynamic equilibrium within the explosion and a non-equilibrium model which accounts for irreversible processes to achieve more realistic results.

26391 (WSRC-RP–92-1136) **Probabilistic treatment of a long-term shutdown event with peak xenon and failed rods: Task: PRA.** Topp, S.V. Westinghouse Savannah River Co., Aiken, SC (United States). Sep 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014755. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes PRA techniques used to estimate the frequency of occurrence of a chain of events postulated under Section 15.4.4.2 of the K-Reactor SAR, "Other Reactivity Additions During Shutdown." This scenario is related to the requirements in Technical Specification 3.1.3, "Reactivity Requirements-Shutdown."

26392 (WSRC-TR–91-372-Rev.2) **GAM-HEAT: A computer code to compute heat transfer in complex enclosures: Revision 2.** Cooper, R.E.; Taylor, J.R. Westinghouse Savannah River Co., Aiken, SC (United States). Dec 1992. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014724. Source: OSTI; NTIS; GPO Dep.

This report discusses the GAM_HEAT code which was developed for heat transfer analyses associated with postulated Double Ended Guilliotine Break Loss Of Coolant Accidents (DEGB LOCA) resulting in a drained reactor vessel. In these analyses the gamma radiation resulting from fission product decay constitutes the primary source of energy as a function of time. This energy is deposited into the various reactor components and is re-radiated as thermal energy. The code accounts for all radiant heat exchanges within and leaving the reactor enclosure. The SRS reactors constitute complex radiant exchange enclosures since there are many assemblies of various types within the primary enclosure and most of the assemblies themselves constitute enclosures. GAM-HEAT accounts for this complexity by processing externally generated view factors and connectivity matrices as discussed below, and also accounts for convective, conductive, and advective heat exchanges. The code is structured such that it is applicable for many situations involving heat exchange between surfaces within a radiatively passive medium.

26393 (WSRC-TR–91-430) **Verification, validation, and benchmarking report for AXLIB4: A processor to generate JOSHUA records of axial power shape versus time.** Le, T.T. Westinghouse Savannah River Co., Aiken, SC (United States). Jul 1991. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93016125. Source: OSTI; NTIS; INIS; GPO Dep.

AXLIB4 is a transient one-dimensional diffusion theory calculation written to provide JOSHUA records of assembly axial power shapes versus time at start and end of subcycle while safety rods are falling during a scram. The WIGGLE program written by R. E. Pevey provides the diffusion theory calculation. AXLIB4 is not a stand-alone code and is connected to LLAP through an EXECUTE statement and JOSHUA interface libraries. The input data are passed to AXLIB4 from a driver routine (LLAP) and from interface JOSHUA records linking the code to the driver routine database. This report concerns the verification and validation of AXLIB4. The verification was performed to determine if AXLIB4 was using the correct theory and that all the subroutines function as required. The validation was performed by comparing the results of the code with the analytical solutions of test problems. The first test problem is a heterogeneous calculation using a pre-accident power profile (includes end-fittings); this problem is designed to test the calculation of total and decay heat assembly powers input versus time, and the initial power shape calculation. The second test problem is a homogeneous problem designed to test the initial and transient power shape calculational ability. These two test problems and their analytical solutions are repeated from the Benchmarking Report for WIGGLE written by R. E. Pevey. Since the results of these two benchmark solutions were identical to the analytical solutions, it is the conclusion of this study that AXLIB4 was correctly implemented and is ready to submit to SCMS.

26394 (WSRC-TR–92-029) **Uninstrumented assembly airflow testing in the Annular Flow Distribution facility.** Kielpinski, A.L. Westinghouse Savannah River Co., Aiken, SC (United States). Feb 1992. 360p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93016841. Source: OSTI; NTIS; GPO Dep.

During the Emergency Cooling System phase of a postulated large-break loss of coolant accident (ECS-LOCA), air enters the primary loop and is pumped down the reactor assemblies. One of the experiments performed to support the analysis of this accident was the Annular Flow Distribution (AFD) experiment, conducted in a facility built for this purpose at Babcock and Wilcox Alliance Research Center in Alliance, Ohio. As part of this experiment, a large body of airflow data were acquired in a prototypical mockup of the Mark 22 reactor assembly. This assembly was known as the AFD (or the I-AFD here) reference assembly. The I-AFD assembly was fully prototypical, having been manufactured in SRS's production fabrication facility. Similar Mark 22 mockup assemblies were tested in several test facilities in the SRS Heat Transfer Laboratory (HTL). Discrepancies were found. The present report documents further work done to address the discrepancy in airflow measurements between the AFD facility and HTL facilities. The primary purpose of this report is to disseminate the data from the U-AFD test, and to compare these test results to the I-AFD data and the U-AT data. A summary table of the test data and the B&W data transmittal letter are included as an attachment to this report. The full data transmittal volume from B&W (including time plots of the various instruments) is included as an appendix to this report. These data are further analyzed by comparing them to two other HTL tests, namely, SPRIHTE 1 and the Single Assembly Test Stand (SATS).

26395 (WSRC-TR–92-335) **USH cooling via Septifoils.** Spatz, T.L. Westinghouse Savannah River Co., Aiken, SC (United States). Nov 1992. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014746. Source: OSTI; NTIS; INIS; GPO Dep.

Following a hypothetical Loss of Coolant Accident (LOCA) the moderator level in the reactor tank would decrease. The current operating procedure with the new Type Q Septifoil is to maintain Septifoil cooling during a LOCA. With the Type Q Septifoil the coolant flows up the Septifoil to ports above and just below the Poison Plate where it is discharged into the reactor tank. The

coolant would then spray from the top of the Septifoil, splashing onto the Universal Sleeve Housings (USH) which house the assemblies, and enhance the cooling of the assemblies. The goal of the experiments performed in the HTL under Task Plan 92-062-1 was to determine the flow rate down the outside of the USH as a function of Septifoil flow. Information on USH cooling is necessary in the calculation of Gamma Heating Power Limits for K Reactor. This task (92-062-1) parallels a similar task (90-074-1) which was performed to redesign the Septifoil (Type Q) and verify its performance. The facility that was used was the same test facility as that used by the previous task, namely Poison Plate Flow Test Rig. A relationship between the flow rate inside a Septifoil to the water collected by an USH is presented. The test apparatus consisted of three Septifoils, each surrounded by six USHs. The geometry is prototypic of the reactor. Supplemental testing was performed after a preliminary investigation of the early results showed a drop in the USH collection flow rate near a Septifoil flow rate of about 7 GPM. The supplemental data supported the earlier data at low flow rate (<10 GPM) an expanded the range of data to 20 GPM by resolving nonprototypic issues.

26396 (WSRC-TR–93-0094) **Seismic II over I Drop Test Program results and interpretation.** Thomas, B. Westinghouse Savannah River Co., Aiken, SC (United States). Mar 1993. 379p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014761. Source: OSTI; NTIS; INIS; GPO Dep.

The consequences of non-seismically qualified (Category 2) objects falling and striking essential seismically qualified (Category 1) objects has always been a significant, yet analytically difficult problem, particularly in evaluating the potential damage to equipment that may result from earthquakes. Analytical solutions for impact problems are conservative and available for mostly simple configurations. In a nuclear facility, the "sources" and "targets" requiring evaluation are frequently irregular in shape and configuration, making calculations and computer modeling difficult. Few industry or regulatory rules are available on this topic even though it is a source of considerable construction upgrade costs. A drop test program was recently conducted to develop a more accurate understanding of the consequences of seismic interactions. The resulting data can be used as a means to improve the judgment of seismic qualification engineers performing interaction evaluations and to develop realistic design criteria for seismic interactions. Impact tests on various combinations of sources and targets commonly found in one Savannah River Site (SRS) nuclear facility were performed by dropping the sources from various heights onto the targets. This report summarizes results of the Drop Test Program. Force and acceleration time history data are presented as well as general observations on the overall ruggedness of various targets when subjected to impacts from different types of sources.

26397 (YJT–90-16) **Microearthquakes in the Baltic shield: Seismotectonic analysis for nuclear power plant in the Loviisa area, South-eastern Finland.** Saari, J. (Imatran Voima Oy, Vantaa (Finland)). Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Nov 1990. [35p.] Order Number DE93630654. Source: OSTI; NTIS; INIS.

Microearthquake observations are used to study the local seismicity and seismotectonics in the Precambrian rapakivi granite, in the Loviisa area, SE Finland. The study area, around the nuclear power plant in Loviisa, is limited within a radius of 100 km. The results from local microearthquake network in the Loviisa area are presented. During six years of measuring, there were 29 micro- and ultra-microearthquakes (ML = 0.1 - 1.2) in the area. The events identify active faults in the area. The results are discussed with the framework of local seismotectonic interpretation. The estimated value of the peak slip is an important parameter connecting microearthquakes to geodynamical processes. The peak slip gives approximation to the size of seismic and aseismic movement in a certain fault and thus also an indication of ongoing tectonic processes. The movements in the active fault may continue for thousands of years. (orig.).

2401 Power Systems

26398 (CONF-921273–) **Workshop on electric utility systems modeling.** Prasad, R.; Kittur, R.; Walker, R.; Marten, D. Energy Consultants, Inc., Las Cruces, NM (United States). [1992]. 274p. Sponsored by USDOE Federal Energy Regulatory Commission, Washington, DC (United States). From Workshop on electric utility systmes modeling; Las Cruces, NM (United States); 15-17 Dec 1992. Order Number DE93013924. Source: OSTI; NTIS.

The primary objective of this workshop is to obtain a clear understanding of the various details involved in developing electric utility models from public-domain information. The workshop is aimed at providing a thorough tutorial and a hands-on exercise in developing a set of relational databases that can be used to analyze the behavior of selected power systems. Because of several modeling details that can be utility-specific, issues that are common among all systems need to be addressed. These common issues include: Data collection from public-domain sources; generation of connectivity diagrams; generation/load/tie-line MW assignments; parameter database creation (.DAT); development of one-line database (.OL); development of geographic database (.GEO); error-checking between databases; development of power-flow data files (.DCD and IEE); and power-flow analysis.

26399 (LBL–32231) **Transmission planning in the era of integrated resource planning: A survey of recent cases.** Baldick, R.; Kahn, E.P. Lawrence Berkeley Lab., CA (United States). Sep 1992. 171p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015242. Source: OSTI; NTIS; GPO Dep.

State action is critical to the expansion of the high-voltage transmission network, because regulated utilities must seek approval from utility commissions for proposals to site new lines. It is the purpose of this report to survey the regulatory treatment of issues that are unique to or ubiquitous in transmission planning and use. The authors review recent transmission siting cases to examine how the issues are presented to and resolved by state regulatory commissions and to provide a perspective for more general discussion of transmission policy. Their primary focus is on planning issues. Transmission capacity expansion is not typically treated in integrated resource planning. It is usually assumed that there is adequate transmission to achieve any particular plan. The authors believe that one important reason for this omission is the inherent complexity of transmission system expansion. Regulators and competitors may be at a serious disadvantage in negotiating or adjudicating specific transmission proposals with utilities, who generally have greater knowledge of both general technological considerations and case specifics. This problem of asymmetric information must be addressed at some level in planning or dispute resolution. However, they observe that explicit consideration of the information problem is absent from most regulatory and technical analysis of transmission. The goal of this survey is to share knowledge about the problems facing state regulators over the siting of new transmission facilities, and help to define constructive approaches to them.

26400 (DOE/EIA–0455(91)) **Electric plant cost and power production expenses 1991.** USDOE Energy Information Administration, Washington, DC (United States). Office of Coal, Nuclear, Electric and Alternate Fuels. 13 May 1993. 160p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93013929. Source: OSTI; NTIS; GPO; INIS; GPO Dep.

Electric Plant Cost and Power Production Expenses is prepared by the Survey Management Division; Office of Coal, Nuclear, Electric and Alternate Fuels (CNEAF); Energy Information Administration (EIA); US Department of Energy. This publication presents electric utility statistics on power production expenses and construction costs of electric generating plants. Data presented here are intended to provide information to the electric utility industry, educational institutions, Federal, State, and local governments, and the general public. These data are collected and published to fulfill data collection and dissemination responsibilities of the Energy Information Administration (EIA), as specified in the Federal Energy Administration Act (Public Law 93-275), as amended.

26401 (LBL–33046) **In situ Raman spectroscopy of lithium electrode surface in ambient temperature lithium secondary battery: Final report.** Tachikawa, Hiroyasu (Jackson State Univ., MS (United States). Dept. of Chemistry). Lawrence Berkeley Lab., CA (United States). Sep 1992. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015238. Source: OSTI; NTIS; GPO Dep.

Raman spectroscopy was used to characterize surface layers on lithium electrodes in different solvents such as propylene carbonate (PC), dimethyl carbonate (DMC), diethyl carbonate (DEC), and polyethylene glycol 400 dimethyl ether (PEG400DME). Both DMC and DEC were used singly, and also mixed with either methyl acetate (MA) or methyl formate (MF). The Raman spectra showed that passive films formed on the Li surface in different solvents may have different chemical structures, which changed during the charging and discharging processes. Raman spectroscopy was also applied to characterize zinc electrode surfaces in alkaline solutions. The results suggested that ZnO and $Zn(OH)_2$ formed on the Zn electrode when a passive potential was applied. A solid film of fullerene C_{60}, which could be used as a cathode in Li rechargeable batteries, was examined in the PEG400DME solution by both electrochemical and Raman spectroscopy. Cyclic voltammograms (CVs) showed five redox peaks which suggested the formation of C_{60}^{-}, C_{60}^{2-}, C_{60}^{3-}, C_{60}^{4-}, and C_{60}^{5-}. Raman spectra obtained from a thin C_{60} film indicated that the thin fulleride film dissolved in the PEG400DME/$LiClO_4$ solution at negative potentials.

26402 (NEI-DK–1197) **Lithium accumulators: Final report.** Hennesoe, E.; Lambine, T.-L.; Mogensen, M. Risoe National Lab., Roskilde (Denmark). Materials Dept. Mar 1993. 261p. (In Danish). Contract EM-1443/88-2;Contract ENS-1443/89-2. Order Number DE93500356. Source: OSTI; NTIS.

EFP-88; EFP-89.

The publication contains two research reports on lithium accumulators. One describes research carried out on two different types of lithium batteries in glass and stainless-steel-can where the impedance was measured for several years and fitted for the circuit model LR(Q(R(C(RQ)))). In the other research project electrodes of sputtered Ni and stainless steel in electrolytes of type $LiAlCl_4,nSO_2$ ($2.3 \leq n \leq 4.1$) and 1.5M $LiAlCl_4$ in SO_2Cl_2 were tested using cyclic voltametry, frequency analysis, SEM, EDAX and X-ray diffraction. (AB).

26403 (NEI-DK–1197, pp. 1-143) **Precipitation of LiCl and Li from SO_2- and SO_2Cl_2-catholyte: Working report on Li accumultor project.** Lambine, T.-L. Risoe National Lab., Roskilde (Denmark). Materials Dept. Mar 1993. (In Danish). Contract EM-1443/88-2;Contract ENS-1443/89-2. In *Lithium accumulators: Final report.* 261p. Order Number DE93500356. Source: OSTI; NTIS.

EFP-88; EFP-89.

Electrodes of sputtered Ni and stainless steel (SS) in electrolytes of type $LiAlCl_4,nSO_2$ ($2.3<n<4.1$) and 1.5M $LiAlCl_4$ in SO_2Cl_2 are tested using cyclic voltametry, frequency analysis, SEM, EDAX and X-ray diffraction. In case of cyclic voltametry the nucleation potential is found independent of the type of catholyte. By precipitating 500 mum Li thread shaped Li is formed. This is more noticeable using $LiAlCl_4,nSO_2$ than $LiAlCl_4,SO_2Cl_2$. Nucleation potential is lower for Ni than for SS, and the current increases more rapidly when the nucleation potential is reached. So Ni is evaluated as more suitable for anodes than SS. The solid electrolyte interface (SEI) shortly after a step to 0 mV vs. Li/LiCl was thinner using n=2.6 than n=4.1. Addition of 2 w% PVC lead to the sinking of the nucleation potential by 30-50 mV and SEI thickness decreased after the step to 0 mV. However electrodes from the PVC experiments reacted extremely exothermly by the following dismounting in argon atmosphere. (au) (12 refs.).

26404 (NEI-DK–1197, pp. 1-131) **Lithium accumulator: Report on work carried out 1992-3.** Hennesoe, E. Risoe National Lab., Roskilde (Denmark). Materials Dept. Mar 1993. (In Danish). Contract EM-1443/88-2;Contract ENS-1443/89-2. In *Lithium accumulators: Final report.* 261p. Order Number DE93500356. Source: OSTI; NTIS.

EFP-88; EFP-89.

The impedance of different types of Li-batteries in glass and stainless steel can have been measured for several years and fitted for the circuit model LR(Q(R(C(RQ)))). The result is interpreted according to 5 models. The most reliable model assumes a primary layer having a constant thickness determinated by the tunneling effect and a porous secondary layer which has a significant electrolyte content that, along the surface of the primary layer is very open, but perpendicular to the surface has a rather blocked porous structure. Older cells that are regenerated with heavy loads show a low impedance with values that are in agreement with the hypothesis on an open structure between the primary and the secondary layer so that the latter will separate itself. Microcalorimetry has been shown to be suitable for determining the electron conductivity of the LiCl-layer, values are 3E-13 to 8E-11 S/cm. Comparing with the growth of the LiCl-layer it is shown that only 10% of the LiCl formed by self discharge is precipitated into the layer. (au).

26405 (NEI-DK–1208) **Organic electrolytes for sodium batteries.** Vestergaard, B. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Kemisk Lab. A. Apr 1993. 238 p.p. Order Number DE93500397. Source: OSTI; NTIS.

The aim was to develop new electrolyte mixtures. 1-methyl-3-ethyl-imidazolium chloride (MEICl) mixed with aluminum chloride was the standard of reference. The new electrolytes should be utilized with sodium in room temperature batteries. Several triazolium chloride derivates were prepared, including 1-ethyl-4-methyl-1,2,4-triazolium chloride, 1,4-dimethyl-1,2,4-triazolium chloride, 1,2-dimethyl-1,2,3-triazolium chloride and 1-methyl-3-paramethoxy,benzyl-1,2,3-triazolium chloride. Other nitrogen containing ring systems like 1,2-dimethyl-pyrazolium chloride, 3-methyl-thiazolium chloride and MEICl were synthesized. An attempt to prepare 1,4-dimethyl-tetrazolium chloride was successful. Recrystallization procedures and the melting point or decomposition temperature for the salt are also described. $AlCl_3$ was added to the organic chloride salts and the reactions reported. Conductivity of 14dm124tcl:$AlCl_3$ and the 1m3pmb123tcl:$AlCl_3$ is compared with the MEICl:$AlCl_3$ system. Conductivities of the pure salts 14dm124tcl, 1e4m124tcl and 3mtzcl are listed. Voltammograms of < 3 mole % of 14dm124tcl in NaCl:$AlCl_3$ melts at 160-170 deg. C indicated that 14dm124tcl acted as a reversible anode in these melts. Results of AC-impedance measurements of sodium in basic MEICl:$AlCl_3$ melts are reported as internal cell resistance versus time. The resistance must be considered too big for battery applications (> 20000Ω after 1 hour). Results of AC-impedance

measurements of Neosepta^R an- or cation exchange membranes are given. Battery experiments with Na/Nasicon/$FeCl_3$:MEICl:$AlCl_3$/Mo showed a reduction of Fe^{3+} to Fe^{2+} by the electrolyte. 100% utilization of the formed Fe^{2+} cathodic capacity was possible. (AB) (142 refs.).

This combination glossary and list of acronyms and abbreviations was compiled to provide the user a ready reference to System Safety Development Center (SSDC) terms. The acronyms are from the publication INEL Acronyms published by the Technical Publications Group. This group updates these acronyms periodically; the version used in this report was dated October 1992.

26407 (DOE/CR–0016) **Semiannual report to Congress on Inspector General audit reports for the period October 1, 1992 to March 31, 1993.** USDOE Office of Inspector General, Washington, DC (United States). May 1993. 25p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

Report to The Secretary.

This is the Secretary of Energy's eighth Semiannual Report to Congress to be submitted under the Inspector General Act of 1978, as amended. Pursuant to the Inspector General Act Amendments of 1988 (Public Law 100-504), agency heads are to report to Congress on the status of final action taken on audit report recommendations. This report complements a report prepared by the Department's Office of Inspector General (IG) that provides information on audit reports issued during the period and on the status of management decisions made on IG audit reports. During the period covered by this report, October 1, 1992, to March 31, 1993, the Department took final action on six contract and financial assistance audit reports. At the end of the period only four reports awaited final action. With regard to operational, financial, and preaward audits, final action was taken on 15 reports, resulting in 95 audit reports needing final action at the end of the period. This report has three sections. The first outlines significant audit accomplishments achieved by the Department during the reporting period. The second section contains the statistical tables that illustrate the status of final action on IG audit reports. The third lists the audit reports that are one year or more past management decision and have not completed final action. This section also provides the status of corrective actions on each of these reports.

26408 (DOE/EIA–0035(93/04)) **Monthly energy review, April 1993.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. 28 Apr 1993. 160p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012827. Source: OSTI; NTIS; GPO; GPO Dep.

Energy production during January 1993 totaled 5.7 quadrillion Btu, a 3.3-percent decrease compared with the level of production during January 1992. Coal production decreased 9.9 percent, petroleum production dropped 3.9 percent, and natural gas production increased 0.5 percent. All other forms of energy production combined were up 4.9 percent from the level of reduction during January 1992. Energy consumption during January 1993 totaled 7.7 quadrillion Btu, 0.4 percent above the level of consumption during January 1992. Coal consumption increased 2.2 percent, natural gas consumption was up 1.3 percent, and petroleum consumption dropped 2.8 percent. Consumption of all other forms of energy combined increased 5.1 percent compared with the level 1 year earlier.

26409 (DOE/ER/75760–1) **SET Careers Program: An interactive science, engineering, and technology career education exhibit: Annual progress report, September 1, 1992–October 31, 1993.** Cole, P.R. New York Hall of Science, NY (United States). 31 Mar 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER75760. Order Number DE93014095. Source: OSTI; NTIS; GPO Dep.

The New York Hall of Science, in response to the national crisis in education and employment in science and engineering, is developing and pilot testing a unique, interactive, video-based, hypermedia series on energy-related and other science and engineering careers for middle and junior high school students. Working in collaboration with the Consortium for Mathematics and its Applications (COMAP) and the Educational Film Center (EFC), this pilot-demonstration phase will last 14 months, during which time the basic design, production, and testing of eight science and engineering career modules (video and software) will be completed and installed as an interactive educational exhibit at the New York Hall of Science. This career education package will then be distributed to other science technology centers nationwide.

26410 (DOE/ER/75773–1) **[Michigan Technological University Pre-Service Teacher Enhancement Program]: Progress performance report.** Anderson, C.S.; Yarroch, W.L. Michigan Technological Univ., Houghton, MI (United States). 27 Apr 1993. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER75773. Order Number DE93013538. Source: OSTI; NTIS; GPO Dep.

The Michigan Technological University Teacher Education Program received funding from the US Department of Energy for the purpose of providing capable and suitably inclined, MTU Engineering and Science students a chance to explore high school level science and mathematics teaching as a career option. Ten undergraduate students were selected from nominations and were paired with mentor teachers for the study. This report covers the experience of the first ten nominees and their participation in the program.

26411 (DOE/IG–0001/93) **Office of Inspector General semiannual report to Congress, October 1, 1992–March 31, 1993.** USDOE Office of Inspector General, Washington, DC (United States). Apr 1993. 68p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

Report to The Secretary.

This Office of Inspector General Semiannual Report to the Congress covers the period from October 1, 1992, through March 31, 1993. The report summarizes significant audit, inspection and investigative accomplishments for the reporting period. Much of the work performed by the Office of Inspector General during this period was in areas relating to the material weaknesses identified by the previous Secretary in his Federal Managers' Financial Integrity Act letter to the President or in areas designated as "high risk" by the Office of Management and Budget. These "high risk" areas are identified and covered in this Semiannual Report to Congress, as is the other work done by the Office of Inspector General in response to mandated or legislated requirements. During this reporting period, the Office of Inspector General issued 96 audit reports. As a result of reviews of contract costs, the Office of Inspector General determined that $3.7 million in costs were either questionable or unsupported. Management committed to taking corrective actions which the Office of Inspector General estimates will result in a more efficient use of funds totaling $153 million. For reports issued during the period, the Office of Inspector General made recommendations that, when implemented by management, could result in $105 million being put to better use.

26412 (ORNL/FTR–4170) **Executive conference on energy technology policy for sustainable development: Comparing long-term approaches: Foreign trip report, December 6–17, 1991.** Fulkerson, W. Oak Ridge National Lab., TN (United States). 26 Dec 1991. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011091. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the conference (Energy Technology Policy for Sustainable Development: Comparing Long-Term Approaches) and he chaired the Keynote session. He also visited the University of Utrecht to discuss work they are doing on CO_2 sequestering and other energy technology and energy policy analyses. The NOVEM

conference was noteworthy both for its focus and because some interesting recommendations came out. Among the recommendations were that OECD nations are underinvesting in energy technology R&D given the greenhouse changes and that the underinvestment was most pronounced for energy efficiency and renewables which were underfunded compared to nuclear and fossil. The recommendations covered energy technologies, what to do about constraints to adopting energy technologies which are more compatible with sustainable development, and energy policy and analytical tools.

26413 (DOE/FTR–93013011) **Travel to Paris, France to attend the IAEE meeting and to present a paper on the method and the results of import substitution using alternative import vectors for the United States, France and Japan: Foreign trip report, May 17–24, 1992.** Roop, J.M. Pacific Northwest Lab., Richland, WA (United States). 20 Jun 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93013011. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This is a trip report submitted after attendance at the IAEE meeting in France in May 1992. Notable items included a talk on the importance of politics in the pricing of oil and other plenary sessions on energy conservation, barriers to conservation investments, energy development in third world countries, community empowerment programs, and the out-sourcing of energy-intensive production. The meeting included with an OECD/IEA Expert Workshop on Life-cycle Analysis of energy systems.

26414 (CONF-9303181–1) **Purity and danger: Protection of Native American religious sites and knowledge in federal development.** Treitler, I.E. (Tennessee Univ., Knoxville, TN (United States). Energy, Environment and Resources Center). Oak Ridge National Lab., TN (United States). 3 Mar 1993. 18p. Sponsored by USDOE Federal Energy Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From Society for Applied Anthropology meeting; San Antonio, TX (United States); 10-14 Mar 1993. Order Number DE93015483. Source: OSTI; NTIS; GPO Dep.

Social Impact Assessment (SIA) is the process by which the impacts of development projects on the social structure and culture of the potentially affected community are determined. This case study reports on the author's experience as a participant in the interaction between the Federal Energy Regulatory Commission (the Commission) and Native American Tribes concerned with the potential outcomes of the Commission's actions. Past and ongoing efforts of the Commission to develop assessment and analysis procedures that give priority to the Native American socio-cultural values are reviewed. Any generalizations drawn from this case study must be at a very broad, even theoretical level, and must be tested for each tribal population and each environmental context. Because the work is in progress, the efficacy of some of the methods documented has not been fully tested. The goal of this case study is to submit a preliminary evaluation of the interactions between the Commission and concerned Tribes in the project area.

26415 (DOE/FTR–93013562) **[Travel to Belarus and Russia to engage in bilateral discussions on a broad range of human resources topics]: Foreign trip report, April 13–26, 1992.** Sieber, H.A. Westinghouse Hanford Co., Richland, WA (United States). 1992. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93013562. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The trip was arranged to bring together a team of human resources management specialists from throughout the United States to visit Belarus and Russia. The delegation's purpose was to engage in bilateral discussions with foreign counterparts covering a broad range of human resources topics. Participation represented another avenue to demonstrate US support for the political, social and economic developments taking place within the former Soviet Union.

26416 (INIS-mf–13550) **Investing for a better environment.** European Bank for Reconstruction and Development, London (United Kingdom). 1993. [26p.] Order Number DE93631657. Source: OSTI; NTIS (US Sales Only); INIS.

To address the broad range of environmental issues in central and eastern Europe, including the former Soviet Union, the European Bank for Reconstruction and Development has adopted a twofold operational strategy: a regional programme approach and a project-based approach. The Bank is undertaking studies of environmental legislation and standards, and of training, liability and public participation requirements in the countries where it operates. It has also initiated environmental assessments in sectors where future investment projects are anticipated. The principal objectives of this work are to assist the countries of central and eastern Europe, those who wish to invest in these countries and Bank staff in their environmental appraisal work.

26417 (INIS-mf–13551) **Environmental management: The bank's policy approach.** European Bank for Reconstruction and Development, London (United Kingdom). 1992. [15p.] Order Number DE93631658. Source: OSTI; NTIS (US Sales Only); INIS.

In order to play a leadership role in the environmental recovery of central and eastern Europe, the Bank will pursue the following policy priorities: assistance to the countries of operations in environmental policy formulation, including the development of effective legal and regulatory instruments, the adoption of appropriate emissions and effluents standards and the creation of the institutional and human resources capacity to monitor and enforce them; promoting the use of a variety of economic instruments to address the underlying cause of environmental degradation and the adoption of market-based techniques in environmental management programmes; encouraging the development of an environmental goods and services industry in the countries of operations, of commercially viable investments in environmental technologies and pollution prevention and control, and by funding environmental infrastructure projects; initiation of, or support for, special studies and programmes to address regional and national environmental problems and to promote environmental education within the population and institutions of the countries of operations; adoption of adequate environmental assessment, management planning, audit and monitoring procedures throughout its activities; and promoting the adoption and implementation of procedures for provision of information to, and consultation with, all levels of government and the general public - especially potentially affected parties - concerning environmental matters.

26418 (NUTEK-R–92-43) **Electricity market under change: A study of electric power markets in Eastern Europe, CIS and the Baltic states.** Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). Nov 1992. [92p.] (In Swedish). Order Number DE93631659. Source: OSTI; NTIS; INIS.

The electric power sector of the countries and their many problems are described. Statistical data on supply and demand pieces, primary energy use et cetera are given. A brief overview of the economical situation, and a discussion of nuclear power safety in the area are presented. (34 refs., 7 figs., 37 tabs.).

USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930488–1: 10. symposium on training of nuclear facility personnel, Nashville, TN (United States), 25-29 Apr 1993). Order Number DE93009956. Source: OSTI; NTIS; INIS; GPO Dep.

In a multi-purpose research laboratory, innovation and creativity are required to satisfy the training requirements for hazards to people and the environment. A climate that encourages excellence in research and enhances hazard minimization skills is created by combining technical expertise with instructional design talent.

26420 (CONF-930276–Summ.) **Industry/Department of Energy workshop on chemical safety: Summary and highlights.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Deputy Assistant Secretary for Safety and Quality Assurance. May 1993. 46p. Sponsored by USDOE, Washington, DC (United States). From Department of Energy (DOE)/industry workshop on chemical safety; Germantown, MD (United States); 10-11 Feb 1993. Order Number DE93014702. Source: OSTI; NTIS; GPO Dep.

As part of the US Department of Energy (DOE) Office of Environment, Safety and Health (EH) oversight responsibilities under Secretary of Energy Notice 6D, the Office of Safety and Quality Assurance (EH-30) routinely evaluates the adequacy and effectiveness of line organization nonnuclear safety programs and processes, particularly where occupational safety can be affected. As a result of safety concerns raised in several forums, including Tiger Team Assessments and Technical Safety Appraisals, reviews of chemical incidents at DOE facilities, identification of safety issues by external DOE oversight organizations, and the EH oversight evaluation of Program Secretarial Officers' safety analysis programs, EH has determined that chemical safety is a key area requiring further evaluation. This workshop summary provides insight into the safety culture and management policies of leading US chemical companies. This summary also suggests some actions by the Department of Energy for improving its own safety activities. As part of the workshop, representatives of the chemical industry discussed the programs their companies have carried out to reduce or eliminate the use of highly hazardous chemicals as much as possible. The chemicals focused on for elimination or risk reduction included chlorine, ammonia, hydrogen fluoride, and sulfur dioxide.

26421 (CONF-930570–1) **Integrating Natural Resource Damage Assessment and environmental restoration activities at DOE facilities.** Bascietto, J.J. (Dept. of Energy, Washington, DC (US). RCRA/CERCLA Div.); Dunford, R.W.; Sharples, F.E.; Suter, G.W. II. Oak Ridge National Lab., TN (United States). [1993]. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 2. annual Federal environmental restoration conference and exhibition; Washington, DC (United States); 25-27 May 1993. Order Number DE93015424. Source: OSTI; NTIS; GPO Dep.

Environmental restoration activities are currently under way at several sites owned by the US Department of Energy (DOE) under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended. DOE is the CERCLA lead response agency for these activities. Section 120(a) of the Superfund Amendments and Reauthorization Act also subjects DOE to liability under Section 107 of CERCLA for natural resource damages resulting from hazardous substance releases at its sites. The Natural Resource Damage Assessment (NRDA) process, by which natural resource injuries are determined and compensatory monetary damages are calculated, is not well known or understood by DOE staff and contractors involved in environmental restoration activities. Nevertheless, natural resource liabilities are potentially a significant source of additional monetary claims for CERCLA hazardous substance releases. This paper describes the requirements of NRDA and explains how to integrate the NRDA and CERCLA Remedial Investigation/Feasibility Study processes, in order to more quickly restore environmental services at the lowest total cost to the public. The first section of the paper explains the statutory and regulatory mandates for the NRDA process. The second section briefly describes the four phases of the NRDA process, while the third section examines the three steps in the assessment phase in considerable detail. Finally, the last section focuses on the integration of the CERCLA and NRDA processes.

26422 (DOE/EH–0322) **Environment, safety and health progress assessment of the Brookhaven National Laboratory (BNL).** USDOE, Washington, DC (United States). Feb 1993. 277p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93013900. Source: OSTI; NTIS; GPO Dep.

This report documents the result of the US Department of Energy (DOE) Environment, Safety and Health (ES&H) Progress Assessment of the Brookhaven National Laboratory (BNL) in Upton, New York. The initial site visit was conducted from December 8 through December 11, 1992, and the onsite assessment was conducted from January 25, 1993, through February 5, 1993. This Progress Assessment included a selective review of the ES&H management systems and programs with principal focus on the Office of Energy Research (ER), the Office of Science and Technology (ST), the Chicago Field Office (CH), the Brookhaven Area Office (BHO), and the site contractor, Associated Universities, Inc. (AUI). The ES&H Progress Assessments are a part of the DOE's continuing effort to institutionalize line management accountability and the self-assessment process throughout DOE and its contractor organizations. The purpose of the BNL ES&H Progress Assessment is to provide senior DOE management with an independent assessment of the adequacy and effectiveness of the DOE and contractor management structures, resources, and systems to address ES&H issues and requirements with the June 1990 Tiger Team Assessment of BNL as the baseline from which progress was measured.

26423 (DOE/ER/60759–T1) **Ecology for a changing earth: Final report.** Brown, J.H. (New Mexico Univ., Albuquerque, NM (United States)); Roughgarden, J. Stanford Univ., CA (United States). 6 Feb 1990. 17p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract FG03-89ER60759. Grant BSR-8821458. Order Number DE93016365. Source: OSTI; NTIS; INIS; GPO Dep.

To forecast the ecological impact of global change, research initiatives are needed on the explicit role of humans in ecological systems, and on how ecological processes functioning at different spatial and temporal scales are coupled. Furthermore, to synthesize the results of ecological research for Congress, policymakers, and the general public, a new agency, called the United States Ecological Survey (USES) is urgently required. Also, a national commitment to environmental health, as exemplified by establishing a National Institutes of the Environment (NIE), should be a goal.

26424 (DOE/FTR–93012248) **Radioactive waste management and environmental restoration issues in England: Foreign trip report, January 24–29, 1993.** Whitfield, R.P. (USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States)); King, W.H.H.; Adams, W.D.; Craig, J.R. Jr.; Whitfield, H.K.; Dyer, R.S. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). 26 Feb 1993. 8p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012248. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of the trip was to gain an understanding of British regulations (and the evolution of these regulations) which permit recycling of previously radioactive-contaminated materials to the British economy; to review the British approach to the application of environmental regulations to nuclear cleanup activities; to observe the British method of communicating controversial information to the public; and to tour various facilities where radioactive waste management and environmental restoration activities are conducted.

26425 (ECE/ENVWA–30) **Contribution to the ministerial conference "environment for Europe", Lucerne, Switzerland, 28-30 April 1993. As adopted by the Senior Advisers to ECE Governments on Environmental and Water Problems on 19 March 1993.** United Nations Economic Commission for Europe (ECE), Geneva (Switzerland). 1993. [17p.] Order Number DE93630852. Source: OSTI; NTIS (US Sales Only); INIS.

The Ministerial Conference "Environmental for Europe", held in Dobris Castle in June 1991, underlined the need to develop an environmental programme for Europe which would serve as the framework for improved coordination of national and international

efforts in Europe. The Expert Group for the second Ministerial Conference "Environment for Europe", to be hosted by the Government of Switzerland in Lucerne from 28 to 30 April 1993, invited the Senior Advisers to propose initial elements for such a programme. The Senior Advisers were also invited to assess progress in the implementation of the conclusions and recommendations of the Bergen, Dublin and Dobris Conferences, to consider the relevant implications of the United Nations Conference on Environment and Development (UNCED), and to prepare draft elements for a Ministerial Declaration for the Lucerne Conference. The present document, prepared in the light of the discussions held and the various documents considered, was adopted by the Senior Advisers to ECE Governments on Environmental and Water Problems at their sixth session in Geneva, 16-19 March 1993 (ECE/ENVWA/29, para. 18).

26426 (ECE/ENVWA–30(add.1)) **Contribution to the ministerial conference "environment for Europe", Lucerne, Switzerland, 28-30 April 1993. Proposals for inclusion in the ministerial declaration: Transmitted by the Senior Advisers to ECE Governments on Environmental and Water Problems to the Expert Group for the Conference pursuant to the decision taken at their sixth session (ECE/ENVWA/29, para. 18).** United Nations Economic Commission for Europe (ECE), Geneva (Switzerland). 1993. [4p.] Order Number DE93630853. Source: OSTI; NTIS (US Sales Only); INIS.

Proposals for inclusion in the Ministerial Declaration, transmitted by the Senior Advisers to ECE Governments on Environmental and Wastes Problems to the Expert Group for the Conference pursuant to the decision taken at their sixth session in Geneva, 16-18 March 1993.

26427 (ETDE/JP-mf–93798681) **Symposium on global environmental conservation and air pollution prevention technology.** 20 Jan 1993. 94p. (In Japanese). Order Number DE93798681. Source: OSTI; NTIS; Available from The Society of Chemical Engineers, Japan, 6-19, Kohinata 4-chome, Bukyo-ku, Tokyo, Japan.

This paper states technologies for prevention of air pollution and CO2 separation/recovery in coal conversion and refuse incineration. For desulfurization in a coal fluidized bed combustor, Ca ion exchanged brown coal is used to increase efficiency and lower cost. In circulating fluidized bed combustion, a high desulfurization rate, 90%, is obtained even if the Ca/S ratio is 1. NOx emission behavior is grasped by chemical bond pattern of nitrogen in coal. Report is made on NOx and SOx emission behaviors in a 50MW fluidized bed demonstration boiler and a course of the measures taken. As to flue gas desulfurization/denitrification/dedusting, a semi-dry simplified desulfurizer, dry simultaneous desulfurization/denitrification by electron beams under coexistence with ammonia gas, etc. are described as technology directed to developing countries which are useful for energy conservation, agriculture and improvement of technical bases. The paper introduces prevention of dioxin emission in the dust collected by the refuse incinerating electrostatic precipitator and measures against NOx, HCl and mercury in flue gas. The developmental status of CO_2 absorption/separation, physical adsorption method, and membrane separation is described, but there are still a lot of technical and economical problems.

26428 (ETDE/JP-mf–93798681, pp. 1-6) **Global engineering of biology and air pollution.** Suzuki, M. (The University of Tokyo, Tokyo (Japan). Institute of Industrial Science). 20 Jan 1993. 94p. (In Japanese). In *Symposium on global environmental conservation and air pollution prevention technology.* Order Number DE93798681. Source: OSTI; NTIS (US Sales Only).

The environmental problem is posed by negative feedback which is imposed by the change in environment by human activity. The problem scalewise has a gradational structure from the molecular level to the global one and is extremely systematic. As chemical industry is good at having access to such a problem, necessity was pointed out of grasping the aspect of air pollution as generated and developed, composing its synthetic model of substance circulation and correctly comprehending the influence of each of all the factors. For example, the change in soil, vegetation, CO2 and other global systems is classified by a scale composed of time and space. As is the case with acid rain, necessity must be recognized of the ground on which the production, influence evaluation and control of causing substances can be studied through discussion on the same table. It is judged necessary to establish the method in which comprehension and future prediction of different phenomena can be made by a synthetic model taking the biological and oceanic functions into consideration as well as possible control of production mechanism from the human activity. 8 figs., 1 tab.

26429 (ETDE/JP-mf–93798681, pp. 66-74) **Foundation for CO2 separating and recovering technologies.** Nagahama, K. (Tokyo Metropolitan University, Tokyo (Japan)). 20 Jan 1993. 94p. (In Japanese). In *Symposium on global environmental conservation and air pollution prevention technology.* Order Number DE93798681. Source: OSTI; NTIS (US Sales Only).

CO2 causing global warming, discharged from general industries has relatively high concentration. This paper explains a phase equilibrium relation and its theory as the foundation for technologies to separate and recover mainly CO2. Separating and recovering technologies may include the following processes. A physical absorption process that dissolves gases under low temperatures and high pressures, followed by depressurization to regenerate the gas absorbed liquid. The process requires a partial gas pressure of more than several atmospheric pressures in the absorption stage, and has a problem of absorbing heavy hydrocarbon simultaneously. A chemical absorption process uses a reversible reaction with amines, for example, to perform an absorption at about 40°C and regenerate amine liquid at about 120°C. A distillation process has a difficulty in application because it requires subzero liquefaction, but has a possibility in the case where liquid CO2 is required. An adsorption process uses often a pressure swing method using zeolite or activated carbon. A membrane separation process is also available, but it requires a huge membrane area if a great amount of gas is to be treated. 5 refs., 7 figs., 6 tabs.

26430 (ETDE/JP-mf–93798681, pp. 75-80) **Current situation in CO2 absorbing and separating pilot plant.** Uchiyama, M. (The Tokyo Electric Power Co. Inc., Tokyo (Japan)). 20 Jan 1993. 94p. (In Japanese). In *Symposium on global environmental conservation and air pollution prevention technology.* Order Number DE93798681. Source: OSTI; NTIS (US Sales Only).

This paper describes the T electric power company's efforts to preserve global environment, taking a CO2 absorbing and separating pilot plant as a main example. Results of the past efforts in the electric utility industry to reduce CO2 emission are shown clearly in the annual change and figures per unit power generation amount for CO2 generation. However, further reduction in emission by 20% to 25% is required to achieve the agreement reached at the UN Environmental Development Conference to restore the CO2 emission level to that in 1990 by the end of the 1990's. Independent researches are being moved forward at each electric utility company. At T Company, indoor tests and bench scale experiments are continued, as well as a test on exhaust gases (containing CO2 at about 11%) from a coal burning boiler (with an output equivalent to 165 MW) using a pilot plant of the absorption process with a capacity of 1000 m^3N/h. Several kinds of absorbents were selected from among amine-based absorbents, which are subjected to the test sequentially. About 4.6 tons of CO2 can be recovered per day. Discussions will continue on different factors. 8 refs., 6 figs., 2 tabs.

26431 (ETDE/JP-mf–93798681, pp. 81-88) **Summary of PTSA-CO2 separating technologies.** Shibagaki, T. (Hokuriku Electric Power Co. Inc., Toyama (Japan)). 20 Jan 1993. 94p. (In Japanese). In *Symposium on global environmental conservation and air pollution prevention technology.* Order Number DE93798681. Source: OSTI; NTIS (US Sales Only).

Electric utility companies are moving forward researches on possibilities of CO2 separating technologies. This paper introduces a CO2 separating technology using a physical adsorption process and a PTSA-CO2 separating technology using a circulating fluidized bed system worked on by the H electric power company. A process to carry out adsorption under pressurization and desorption under depressurization is called a PSA process. A process to perform adsorption under low temperatures and desorption under high temperatures is called a TSA process. The PSA process has better economic effects and operability than the TSA process. However, because even the PSA process has technical and

economic problems in increasing capacities, a bench plant of circulating fluidized bed system (treating 2 m^3 per hour) was built newly to continue demonstration tests. This process desorbs zeolite particles having adsorbed CO2 using an adsorption riser under normal pressure by flowing and returning the particles into a desorption riser under depressurization. The process requires no such complex mechanism as a switching device and can be expanded easily. The test has come to a stage of having obtained results of circulating flow for 500 hours. 9 refs., 11 figs., 5 tabs.

26432 (ETDE/JP-mf–93798906) **Prospect on new energies.: Global warming.** Institute of Applied Energy, Tokyo (Japan). Mar 1991. 26p. (In Japanese). Order Number DE93798906. Source: OSTI; NTIS; Available from The Institute of Applied Energy, 14-2, Nishishinbashi 1-chome, Minato-ku, Tokyo, Japan.

This paper reports surveys on global warming carried out by the General Energy Engineering Research Institute of Japan. An international agreement has been reached on prohibiting manufacture of fluorocarbon that destructs the stratosphere. Fluorocarbon has an influence not only on ozone layer destruction, but also on global warming with an intensity next to CO2. Substitutive fluorocarbons are also demanded of a reivew in this point. The CO2 greenhouse effect is caused mainly from burning fossil fuels. An assumption of collecting, transporting, and treating half of the current annual discharge amount of 20 billion tons would involve an exorbitant amount of expense. There could no other ways but to suppress its use. Even converting fuels to natural gases and restricting use of fossil fuels may impose an immeasurable effect on the human society. No answer to this important problem has been presented because of complexity in the conditions of relevant countries, not to speak of that in developing countries. Efforts should be paid on solving the problems under international cooperations, and comprehensive strategies must be moved forward while determining changes in social and economic conditions. At the same time, consciousness of all of the people in the world on the problems is important. 8 refs., 12 figs., 2 tabs.

26433 (IEE-SR–239) **Analysis on factors affecting energy consumptions and CO2 emissions and their regional and sectoral differences.** Institute of Energy Economics, Tokyo (Japan). 1 Mar 1993. 244p. (In Japanese). Order Number DE93798888. Source: OSTI; NTIS; Available from The Institute of Energy Economics, Dai 10 Mori Biru, 18-1, Toranomon 1-chome, Minato-ku, Tokyo, Japan.

Regional and sectoral characteristics of energy consumption and CO2 emissions in different countries are clarified by constructing a framework for analysis which is common to both developed and developing countries. As a basis of the analysis, cases are estimated of maintaining/fixing the energy demand structure in 1973 and of maintaining the economic growth before 1973, and through comparisons with actual changes, optional effects of energy conservation, fuel conversion, etc. are comparatively analyzed in the framework common to each country. In developed countries economy has slowed down, and energy conservation and petroleum substitution have been promoted. Resultantly CO2 emission has been controlled. Energy conservation effects are large particularly in the industrial sector in Japan. In the former Soviet Union and East European countries where economy pattern is shifting, there are characteristically seen economic stagnation and lowered energy efficiency/energy inefficiency, which will cause the problems if the economy is irrationally activated. In developing countries, economy is growing and energy consumption is markedly increasing. There, more CO2 control measures should be taken. It is necessary to study option of CO2 emission control measures according to character of each country. 136 figs., 35 tabs.

26434 (NEDO-ITE–9111) **Survey of the present status of substances influencing the global environment (methane, freon and nitrous oxide) and the measures against them.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 90p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93799056. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

Following 1990, a survey is made on effects of methane, freon and nitrous oxide on the global environment. Besides arrangement of additional literature, the survey is conducted also on the measures taken from an industrial aspect. The present tackling with the environment problem on governmental and nongovernmental levels is described with regard mainly to the measures against global warming and destruction of ozone layer. With respect to CO2 which is a gas most responsible for the greenhouse effect, various studies are made at home and abroad, but CO2 measures are difficult to be taken in connection with economical development. Emission of other greenhouse effect gases like methane, freon and nitrous oxide has to be also reduced at the same time. Proposed are control of methane by development of paddy water management technique, control of nitrous oxide by improvement of fertilizer, and reduction of methane from livestock intestines by improvement of animal feed. It is effective to promote introduction of the technique of fluidized bed boilers to the coal-thermal power generation in developing countries. Measures against methane emitted from reclaimed sites are also mentioned. It is important to evaluate the measures against other substances affecting the environment as well as the above-mentioned gases and to integrate responsibility, burden and policy guidance. 37 refs., 13 figs., 14 tabs.

26435 (PSI–93-02) **The economics of global warming.** Pillet, G. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Hediger, W.; Kypreos, S.; Corbaz, C. Paul Scherrer Inst. (PSI), Villigen (Switzerland). May 1993. [165p.] Order Number DE93631663. Source: OSTI; NTIS; INIS.

The global warming threat is challenging the world community to both international cooperation and national policy action. This report focuses on the necessity to alternate between "global and national climate policies". The Swiss perspective is at issue. The economic rationales for comparing national climate policy options are analyzed. This report explicitly focusses on the fundamental role of the normative framework and the related environmental-economic requisites for establishing an efficient national climate policy and computing a "carbon tax". Finally, the latest results of the energy and greenhouse gas scenarios for Switzerland, elaborated on within the network of the IEA/ETSAP Project, Annex IV, "Greenhouse Gases and National Energy Options: Technologies and Costs for Reducing Emissions of Greenhouse Gases", illustrate Switzerland's difficulties in reducing greenhouse gas emissions at "reasonable cost" compared with other countries. This should make Switzerland very sensitive to the implementation of efficient environmental-policy instruments and international cooperation. (author) figs., tabs., refs.

26436 (SAND–93-0466C) **Waste minimization/pollution prevention at R&D facilities: Implementing the SNL/NM Process Waste Assessment Program.** Kjeldgaard, E.A. (Sandia National Labs., Albuquerque, NM (United States)); Stermer, D.L.; Saloio, J.H. Jr.; Lorton, G.A. Sandia National Labs., Albuquerque, NM (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930483–8: 9. waste minimization and pollution prevention conference, San Francisco, CA (United States), 13-15 Apr 1993; TTC–1253). Order Number DE93012860. Source: OSTI; NTIS; INIS; GPO Dep.

The Sandia National Laboratories, New Mexico (SNL/NM) Process Waste Assessment (PWA) program began formally on November 2, 1992. This program represents the first laboratory-wide attempt to explicitly identify and characterize SNL/NM's waste generating processes for waste minimization purposes. This paper describes the major elements of the SNL/NM PWA program, the underlying philosophy for designing a PWA program at a highly diverse laboratory setting such as SNL/NM, and the experiences and insights gained from five months of implementing this living program. Specifically, the SNL/NM PWA program consists of four major, interrelated phases: (1) Process Definition, (2) Process Characterization, (3) Waste Minimization Opportunity Assessment, and (4) Project Evaluation, Selection, Implementation, and Tracking. This phased approach was developed to Provide a flexible, yet appropriate, level of detail to the multitude of different "processes" at SNL/NM. Using a staff infrastructure of approximately 60 Waste

Minimization Network Representatives (MinNet Reps) and consulting support, the SNL/NM PWA program has become the linchpin of even more progressive and proactive environmental, safety, and health (ES&H) initiatives such as: (1) cradle-to-grove material/waste tracking, (2) centralized ES&H reporting, and (3) detailed baselining and tracking for measuring multi-media waste reduction goals. Specific examples from the SNL/NM PWA program are provided, including the results from Process Definition, Process Characterization, and Waste Minimization Opportunity Assessments performed for a typical SNL/NM process.

26437 (TVA-Circ.–Z-321) **Some impacts of the 1990 Clean Air Act and state clean-air regulations on the fertilizer industry.** Breed, C.E.; Kerns, O.S. National Fertilizer and Environmental Research Center, Muscle Shoals, AL (United States). [1992]. 16p. Sponsored by Tennessee Valley Authority, Knoxville, TN (United States). (CONF-920815–23: 204. American Chemical Society (ACS) national meeting, Washington, DC (United States), 23-28 Aug 1992). Order Number DE93014197. Source: OSTI; NTIS; INIS.

The Clean Air Act amendments of 1990 will intensify national efforts to reduce air pollution. They will have major impacts on governmental agencies and on industrial and commercial facilities throughout the country. As with other industries, it is essential for fertilizer dealers and producers to understand how these changes to the Clean Air Act can significantly change the way they do business. This paper is proffered as an overview of ways in which the 1990 amendments to the Clean Air Act may impact the fertilizer industry. The nonattainment, toxics, and permit provisions of the amended act will be three areas of particular concern to the fertilizer industry. Implementation of the new regulatory requirements of this legislation promises to be a long and onerous process for all concerned. However, it appears that state and local regulations may have a much more profound impact on the fertilizer industry than the new Clean Air Act.

26438 (CONF-9305151–, pp. 7, Paper 9) **Academic freedom.** Padgett, K.M. (Los Alamos National Lab., NM (US)). USDOE Office of Administration and Management, Washington, DC (United States). [1993]. DOE Contract W-7405-ENG-36. From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. In *Fifteenth Department of Energy Computer Security Group training conference: Mission possible: Connected and protected.* 244p. Order Number DE93011853. Source: OSTI; NTIS.

The American Heritage Dictionary defines Academic Freedom as "Liberty to pursue and teach relevant knowledge and to discuss it freely without restriction from school or public officials or from other sources of influence." In its untarnished form, academic freedom means that a researcher is free to pursue his research without political interference from the academic bureaucracy. This article discusses how the practice of research laboratories doing research for the business community as well as hiring Washington lobbyists to get appropriations has generated a conflict of interest in research. The author proposes that academic freedom is a complex idea when utilised by research laboratories that can no longer pursue purely academic research. The dangers of present-day research posed by perceptions of what is ethical in the laboratory environment are explored. 2 refs.

26439 (DOE/FTR–93011657) **A trip to Hungary to present a paper on bioremediation and to attend the international symposium on environmental contamination in central and eastern Europe: Foreign trip report, October 10–October 19, 1992.** Leo, A.T. Sandia National Labs., Livermore, CA (United States). 4 Nov 1992. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DR00789. Order Number DE93011657. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this trip was to participate in a forum for the transfer and exchange of technologies are applicable in addressing the near-term and long-term environmental needs of Central and Eastern Europe countries. The major emphasis was on identifying and assessing technology transfer and exchange opportunities. Sandia presented a paper: A Systematic Approach for the Design and Application of in Situ Bioremediation. Only limited, informal, contacts with other participants were made.

26440 (NUTEK-B–93-1) **IEA Bioenergy. Annual report 1992.** Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). 1993. 67p. Order Number DE93500865. Source: OSTI; NTIS.

At the end of 1992 fifteen countries or organisations participated in the collaboration on Bioenergy: Austria, Belgium, Canada, Denmark, Finland, Italy, Japan, Netherlands, New Zealand, Norway, Sweden, Switzerland, United Kingdom, United States and CEC. There are four Task Annexes to the Implementing Agreement the period 1992-94: Efficient and Environmentally-Sound Biomass Production Systems; Harvesting and Supply of Woody Biomass for Energy; Biomass Utilization; and The Conversion of Municipal Solid Waste Feedstock to Energy. The achievements from the old Tasks are summarized, and information on the content and progress of the new Tasks are given in this report, as well as lists of published articles and reports.

There is a widely held perception among policy makers, food industries and some governments that consumers would be reluctant to accept irradiated food. This opinion has given opposition groups the basis upon which to make the further claim that consumers would reject such food. Indeed, some opinion polls conducted in some Western countries tend to support this claim. It should be noted that these polls were conducted in countries where no irradiated food was available at the retail level. It is clear from these polls that the majority of consumers had never heard of food irradiation much less knew the benefits which they may expect from it. Initially, most consumers appeared to confuse irradiated food with food contaminated with radionuclides (radioactive food). However, when provided with factual information on food irradiation, higher percentages of consumers appeared to be more willing to buy irradiated food. The situation was quite different when marketing trials of irradiated food were conducted in several countries in the past 5 years, often at the place where non-irradiated food of the same kind were available. These trials conducted in countries such as France, U.S.A., Bangladesh, China, Philippines and Thailand showed that, when consumers had informed choices, they preferred to buy irradiated food, probably on the basis of their higher quality or perceived greater safety. Details of marketing trials of different irradiated food items conducted in the past 5 years will be described. (author). 21 refs, 1 tab.

The International Organization of Consumers Union (IOCU) remains opposed to the wider use of irradiation in food processing, and has yet to be convince that all the long-term safety concerns have been addressed. It remains skeptical, as do consumers generally, that food irradiation is being promoted primarily in the public interest rather than in the interests of other parties. It remains concerned about the monitoring, control and prevention of abuse of the process. Those promoting irradiation should satisfy the genuine and legitimate concerns of IOCU and consumers worldwide; they are still some way from achieving this.

Source: OSTI; NTIS (US Sales Only); INIS.

New technologies are becoming increasingly difficult to introduce. Consumers are concerned about new technologies; they are more aware of mistakes made in introducing them and, therefore, have become apprehensive, particularly regarding food preservation techniques. However, it is enlightening to compare the problems faced today with food irradiation with those experienced several decades ago during the commercialization of pasteurization. Many of the objections to the two preservation processes are identical - e.g. an excuse for the sale of "dirty" food; takes the "life" out of food; diminishes the nutritive value; favours the growth of harmful bacteria; increases food prices. Consumer concerns on food irradiation focus on safety, wholesomeness, cost benefit, information and freedom of choice. In many countries, as well as internationally, consumer organizations are invited to participate in deliberations on food research, food standards and the regulation of new technologies, including food irradiation. Such consultation will be time consuming, but will lead to greater consensus on commercialization of food technologies and the necessary controls. The food irradiation consensus document, elaborated at the 1988 International Conference on "Acceptance, Control of and Trade in Irradiated Food", describes several actions required to achieve consumer acceptance. Better public information was underlined at the Conference. To date, consumer acceptance, has been based primarily on consumer research polls. However, marketing trials are a better indicator of acceptance since consumers can experience the benefits of irradiation - e.g. better flavour, longer storage. Marketing trials over the past seven or eight years in many countries have demonstrated that consumers, when given a choice, will purchase irradiated foods. (author). 7 refs.

26444 (IAEA-TECDOC–696, pp. 175) **Acceptance of food irradiation by the food industry - Problems and prospects.** Tape, N. World Health Organization, Manila (Philippines). Regional Office for the Western Pacific; Joint FAO/IAEA Div. of Nuclear Techniques in Food and Agriculture, Vienna (Austria). Mar 1993. Source: OSTI; NTIS (US Sales Only); INIS.

Regulatory and safety aspects of the process, equipment, and cost factors, as well as obtaining consumer acceptance are factors which have contributed to the slowness of the commercialization of food irradiation. But there are still other factors equally important in determining the rate of commercialization. They are the pragmatic questions asked by food processors themselves. Will irradiation serve my particular needs? How much will it cost? Is it safe for consumer, customers and employees? What regulations will apply and how much will they cost me? What public relations aspects, including local community attitudes, will I need to address? What will consumers think of my product and how can I find out in advance? What liability issues are involved and are they greater or less than existing ones? Response to these questions will vary considerably. The benefits must be large indeed, if existing capital investment in competitive technology is to be replaced by irradiation. The marketplace does not embrace expensive changes easily or rapidly. Situations in which irradiation may compete are those where there are few established competitive processes, where irradiation provides a unique advantage, where existing processes are inadequate or old, or where a less energy intensive process is required. (author). (abstract only).

26445 (IAEA-TECDOC–697, pp. 19-22) **The energy dilemma.** Hatcher, S.R. (Atomic Energy of Canada Ltd., Ottawa, ON (Canada)). International Atomic Energy Agency, Vienna (Austria). Apr 1993. (CONF-9204252–: Technical committee meeting on fission gas release and fuel rod chemistry related to extended burnup, Pembroke (Canada), 28 Apr - 1 may 1992). In *Fission gas release and fuel rod chemistry related to extended burnup: Proceedings of a technical committee meeting held in Pembroke, Ontario, Canada, 28 April - 1 May 1992.* [235p.] Order Number DE93628297. Source: OSTI; NTIS (US Sales Only); INIS.

In his opening address Mr. Hatcher, President and Chief Executive Officer, Atomic Energy of Canada Limited considers different economical, social and environmental aspects of 'energy dilemma' which presents huge energy demands on the one hand and concerns about a healthy environment on the other hand.

26446 (IAEA-TECDOC–701) **Nuclear and conventional baseload electricity generation cost experience.** International Atomic Energy Agency, Vienna (Austria). Apr 1993. [63p.] Order Number DE93629794. Source: OSTI; NTIS (US Sales Only); INIS.

The experienced costs of electricity generation by nuclear and conventional plants and the expected costs of future plants are important for evaluating the economic attractiveness of various power projects and for planning the expansion of electrical generating systems. The main objective of this report is to shed some light on recent cost experience, based on well authenticated information made available by the IAEA Member States participating in this study. Cost information was provided by Canada (Ontario Hydro), Czechoslovakia, Hungary, India, the Republic of Korea and Spain. Reference is also made to information received from Brazil, China, France, Russia and the United States of America. The part of the report that deals with cost experience is Section 2, where the costs of both nuclear and fossil fired plants are reviewed. Other sections give emphasis to the analysis of the major issues and relevant cost elements influencing the costs of nuclear power plants and to a discussion of cost projections. Many of the conclusions can also be applied to conventional plants, although they are usually less important than in the case of nuclear plants. 1 ref., figs and tabs.

26447 (PSI–124) **Reactors 2000: consultation on the technical and economical requirements connected with the possible realization of nuclear installations in Switzerland after the year 2000: Report of the committee.** Haldi, P.A. (ed.) (Paul Scherrer Inst. (PSI), Villigen (Switzerland)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Jul 1992. [178p.] (In French). Order Number DE93629799. Source: OSTI; NTIS; INIS.

In 1989 the OECD started a consultation on the development of nuclear reactors of small and medium size (SMR). The present study is part of the Swiss contribution to this international work. Beyond this primary goal, without being limited solely to SMRs, but exclusively in the Swiss framework, the study attempts to determine a profile for reactors which could be built in Switzerland after the year 2000. The study "Reactors 2000" is based on two polls which were conducted among about 70 persons from concerned

professional circles (industry, utilities, scientific groups, energy policy makers, safety authorities, public organizations) in June 1990 and February 1991. A large majority of the persons interviewed think that - Switzerland should not jeopardize its energetic future by phasing out all activity in the nuclear field, based on circumstances which could be only temporary, - Switzerland should continue its activities in the nuclear field in order to maintain the necessary know-how and a sufficient number of highly qualified specialists both for the safe operation of the existing plants and for the continuation of the development of nuclear technology, - for future plants the goal of an even higher safety level should be aimed for, although, according to the explicit comments of many interviews, today's reactors are considered to be sufficiently safe, - future nuclear power plants should be designed in such a way that the possibility of a severe accident necessitating an evacuation of the Swiss population could be excluded, - Switzerland should participate in international projects, in order to maintain contact to the international development of nuclear technology; on the other hand, it should avoid any single-handed effort (including in the domain of small heating reactors). (author).

2908 Heat Utilization

26448 (VF-UB–93-3) **Biofuel-fired electricity and heat generation in a large district heating system - system studies using the Martes energy system model.** Ryding, B. Vattenfall AB, Vaellingby (Sweden). Jan 1993. 53 p.p. (In Swedish). Order Number DE93500935. Source: OSTI; NTIS; INIS.

The aim of the present study was to study the possibilities of introducing biofuel-fired co-generation of heat and electricity in the Umeaa district heating system. The study was conducted using the Martes energy system model. Results obtained and conclusions reached should also be of interest for other district heating systems. The annual cost of heat production for district heating with and without biofuel-fired cogeneration of heat and electricity was studied for the period 1992 until 2012. Two types of biofuel-fired cogeneration of heat and electricity were studied. One used only biofuel whereas the other used both biofuel and domestic waste. Initially, the cost was lowest for the system used at present in Umeaa, i.e., without simultaneous cogeneration of heat and electricity. After 1994, however, the district heating system with cogeneration of heat and electricity using only biofuel has the lowest cost. The assumed development of the electricity price is of great importance for the competitive ability of cogeneration of heat and electricity. The greater the capacity for electricity, the more it will benefit from a high price of electricity. The study was conducted using data considered to be reasonable in the future. Assessments made on future developments are, however, very difficult since there are numerous factors involved. Sensitivity studies of parameters considered to be of greatest importance for the competitive ability of cogeneration of heat and electricity need to be further studied. These are energy taxation and environmental tariffs, as well as the development of the prices of fuel and electricity. (52 refs., 19 tabs.).

2910 Conservation

26449 (ENEA-RT-INN–92-18) **NORME: Multi-media information system in support of technology utilization and transfer Italian program guidelines for financial assistance.** Gandini, A.G.; Bargellini, M.L.; Fontana, F.; Lo Tenero, B.; Ponzelli, E.; Dell'Universita, F. ENEA, Casaccia (Italy). Area Energia e Innovazione. May 1992. 50p. (In Italian). (RT/INN–92-18). Order Number DE93799210. Source: OSTI; NTIS (US Sales Only).

This module describes the information system, 'Norme', a support to industries (enterprises). This multi-media system contains all the information about the financial facilities and incentives supporting innovation (technology utilization and transfer, especially with regard to energy conservation) which are offered by Italian national, regional and provincial laws. It describes the conceptual and physical structure of the informative system, the typology of the data and functions.

26450 (ENEA-RTI-STUDI-ENE–92-02) **MePER (Methodology in support of Regional Energy Programming) sample survey and requests for participation in Piemonte Region energy conservation assistance programm (law No. 308/82).** D'Aguanno, C. ENEA, Casaccia (Italy). 1992. 58p. (In Italian). (RTI/STUDI-ENE–92-2). Order Number DE93799204. Source: OSTI; NTIS (US Sales Only).

The ENEA (Italian Agency for New Technology, Energy and the Environment) MePER (Methodology in support of Regional Energy Programming) support information system for Italian regional energy balance assessments allows energy planners to obtain a clear picture of sectoral energy efficiency trends and requirements. This paper compares MePER information on the energy supply and demand situation in the industrial sector of the Region of Piemonte with statistical information based on requests by local industrial firms for financial assistance in the implementation of energy conservation interventions. The mechanics of this assistance follows the provisions of Italian energy conservation Law No. 308/82. The aim of this comparative study is to identify areas for possible improvements with regard to effective energy conservation, reveal industrial energy consumption trends, and to gauge the effectiveness of MePER as a functional tool suitable for real time regional energy program management.

26451 (ETDE-IT–93-174) **Public intervention in promotion of energy conservation and in development of renewable energy resources: Italian experience.** D'Angelo, E.; Romerio, R. ENEA, Rome (Italy). Direzione Studi. 1992. 22p. (CONF-920906–4: 15. congress of the World Energy Council (WEC): energy and life, Madrid (Spain), 20-25 Sep 1992). Order Number DE93799193. Source: OSTI; NTIS (US Sales Only).

In Italy, a law passed in 1982 provided financial incentives for energy saving and the development of renewable energy resources. The incentives are administered partly by the Ministry of Industry and partly by the regional governments. This was the first time the Government had turned to financial incentives and regional decentralization to reduce energy consumption and increase the use of renewable sources in the industrial, residential and agricultural sectors. Following an initial period of inevitable legal, regulatory, administrative and technical problems, the law has been widely applied; of the many projects submitted, a great many, mainly in the industrial sector, have received funding from both the Ministry and the Regions. A quantitative assessment shows that in terms of actual energy savings, the results appear significant and encouraging, though it must be pointed out that the assessment was based on design data for projects that have been approved and funded, not completed projects. No less important than the quantitative results is the progress made in decentralizing decision-making in the field of energy. This process, initiated by the 1982 law, was confirmed by a statute passed last year which streamlines the procedures for approving projects and disbursing funds.

26452 (LBL–31469) **Analysis of federal policy options for improving US lighting energy efficiency: Commercial and residential buildings.** Atkinson, B.A.; McMahon, J.E.; Mills, E.; Chan, P.; Chan, T.W.; Eto, J.H.; Jennings, J.D.; Koomey, J.G.; Lo, K.W.; Lecar, M.; Price, L.; Rubinstein, F.; Sezgen, O.; Wenzel, T. Lawrence Berkeley Lab., CA (United States). Dec 1992. 346p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015281. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy (DOE) has recognized the opportunity to achieve energy, economic, and environmental benefits by promoting energy-efficient lighting through federal policies, including lighting standards, financial incentives, and information programs. To assist in this process, the Office of Conservation and Renewable Energy's Office of Codes and Standards invited Lawrence Berkeley Laboratory to assess prospective national impacts for a variety of policy options. Some progress has already been made in developing lighting policies at both the federal and state levels. The US DOE's Office of Building Technologies has evaluated lighting efficiency incentives as part of its analysis for the National Energy Strategy. Fluorescent and incandescent lamp

standards are included in the national Energy Policy Act of 1992 (P.L. 102-486, October 24, 1992). A few states have analyzed or implemented lamp and luminaire standards. Many policy-related issues merit further investigation. For example, there is considerable debate over issues such as mandatory or voluntary standards versus component labeling and other education-oriented strategies. Several different technologies are involved that interact with each other-lamps (incandescent, compact fluorescent, and HID), ballasts (for fluorescent and HID lamps), and fixtures with reflectors and lenses. Control systems and operation patterns must also be considered (timers, automated dimming, or occupancy sensors). Lighting applications are diverse, ranging from offices, restaurants, hallways, hospital operating rooms, to exterior lights. Lighting energy use influences heating and cooling requirements in buildings. Successful lighting system design must also address interactions between architectural design elements and daylighting availability. Proper system installation and ongoing operation and maintenance are crucial. The economic aspects of the preceding points must also be considered for policy making.

Energy markets are influenced by world oil prices, macroeconomic growth, and weather. This report focuses on the influence of these assumptions on energy supply, demand, and prices in the United States and other major energy-consuming countries.

26454 (NEDO-P–9129, pp. 11-142) **Field survey of information on energy policy in the Pacific region.: China as a whole.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. (In Japanese). In *Field survey of information on energy policy in the Pacific region.* 205p. Order Number DE93799052. Source: OSTI; NTIS.

Report is made on results of a survey on the energy situation in China. This paper relates to the whole of China, and separate papers deal with the regions of Central China and East China. The basic target of China is elasticity coefficients of primary energy more than 0.5 and those of electric power more than 0.1. In 1990, the latest year of the 7th 5-year plan, production of primary energy attained the target: 1.08 billion tons in raw coal which is 9% over the target, 138 million tons in crude oil, and 15.2 billion m^3in natural gas. The generated energy from the hydroelectric and thermal power generation attained 618 billion kWh which is 12.3% over the target. Coal reserve is 4 trillion tons within the depth of 1500m. The total oil resource in the inland and continental shelfs is 33 trillion m^3. It is presently urgent to develop more electric power because of its shortage. Development and promotion is planned to be made also of the nuclear power generation and the new energy power generation. 23 figs., 46 tabs.

26455 (NEDO-P–9129, pp. 143-168) **Field survey of information on energy policy in the Pacific region.: Central China region (Provinces of Henan, Hubei, Hunan and Jianxi).** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. (In Japanese). In *Field survey of information on energy policy in the Pacific region.* 205p. Order Number DE93799052. Source: OSTI; NTIS.

The paper reports the results of a survey of the energy situation of the Central China region. The population of the region is 231.62 million. The installed capacity of the Central China power network is 20.29 million kW. About 80% of the power consumption are for the industrial use. On completion of Sanhsia Dam in the Sanhsia development plan, the reservoir capacity will be 30.3 billion m^3, the world's largest scale. On completion of Sanhsia hydroelectric power plant (18-year construction period), generated energy to be obtained will be 17.68 million kW (26 units x 680,000 kW), the world's largest scale. Annual generated energy in all China will reach 1.2 trillion kWh in 2000, and among them demand in Central and East China regions is 384 billion kWh in expectation of an increase of approximately 200 billion kWh during the 1990-2000 term. The effect of power generation at Sanhsia power plant is considerable since their annual generated energy is 67.7 billion kWh in a plan by the water reservoir level of 150m and 94.8 billion kWh in a plan by that of 180m. The total investment made in the Sanhsia project is expected to be over 100 billion gen. 7 figs., 7 tabs.

26456 (NEDO-P–9129, pp. 169-181) **Field survey of information on energy policy in the Pacific region.: East China region (Shanghai city, provinces of Zhejiang, Jiangsu and Anhui).** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. (In Japanese). In *Field survey of information on energy policy in the Pacific region.* 205p. Order Number DE93799052. Source: OSTI; NTIS.

The paper reports the results of a survey of the energy situation of the East China region. The population of the region is 180 million. Electric power consumption is 109.7 billion kWh, 85.6% of which are for the industrial use. The maximum power has a feature of 'peak in summer'. The installed capacity with more than 500kW in the East China power network totals 22.13 million kW in 1990, 89% of which are the thermal power generation. Among three provinces and one city to be supplied, Shanghai city has only thermal power plants. The installed capacity of thermal power plants is 1,625,000kW in Jianbi which is the largest, 1,300,000kW in Xuzhou and 1,200,000kW in Shidongkou No.2 plant. The generated energy in the East China power network in 1990 totals 109.1 billion kWh, 95.4% of which are occupied by the thermal power generation. The installed capacity of thermal power plants shows an increase of 11.2% during implementation of the 7th 5-year plan. The number of a hydroelectric power plant with more than 150,000kW is five. The capacity of hydroelectric power generation is 2.44 million kW which is 11% of the East China power network. 1 fig., 4 tabs.

26457 (IEE-SR–240) **Status-quo of energy-related taxation systems in developed countries and economic instrumets for environmental preservation.** Institute of Energy Economics, Tokyo (Japan). 1 Mar 1993. 401p. (In Japanese). Order Number DE93798889. Source: OSTI; NTIS; Available from The Institute of Energy Economics, Dai 10 Mori Biru, 18-1, Toranomon 1-chome, Minato-ku, Tokyo, Japan.

Energy-related taxation systems in developed countries are investigated including moves toward introduction of environmental taxes to energy. The energy taxation system has become substantial in the public finance in which taxes are shifting from direct to indirect ones. Energy consumption tax revenues in the U.S. and Europe form a half of the specific consumption tax receipts. Patterns of energy taxation, which is mainly for transportation use fuel, are largely different in country. In North European countries introduction of the carbon tax was reported one after another from 1990 to 1991. The introduction was conducted in a trend of strengthening of the indirect tax and is ranked as an economic means to internalize the external environmental cost. EC proposes an environmental tax which mixes the energy tax and the carbon tax at the 1:1 ratio as one of the policies to stably keep CO2 emission in 2000 at the same level as in 1990. Circumstances in each country on the internationally common environmental tax, which also aims at securing funds for developing countries, are complicated, and therefore it is necessary to have discussions fully considering international cooperation. 101 figs., 109 tabs.

26458 (NEDO-P–9129) **Field survey of information on energy policy in the Pacific region.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 205p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93799052. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

As a part of the survey of energy policy information in the Pacific region, report is made mainly on the electric power supply situation in China. The generated power showed a 7.5% growth in the 1980s and was 137,890MW in power plant capacity and 621.3 billion kWh in generated energy in 1990. Electric power consumption is 78.7% of the total consumption in the whole industry, and per capita consumption is 526 kWh. Among the total power plant capacity of thermal and hydroelectric power generation, the thermal power generation shows 73.9% and hydroelectric 26.1%. In a 10 year plan until 2000, power sources which can provide more than 10,000 MW/year are planned to be newly installed and to be comprised of coal-fired (63%), hydroelectric (30%), nuclear (3%) and oil-fired (4%) power generation. Coal has already been used mostly as a substitute of petroleum. Power generation of renewable energy such as wind, geothermal and photovoltaic energy has been developed along with a small hydroelectric power generation to promote electrification in remote areas. Measures to be taken for the environmental policy have been delayed because of a lack of funds though necessity of the policy is admitted. Damages by acid rain are reported. 34 figs., 63 tabs.

26459 (NEI-DK–1193) **Duties as instruments of control: Incitements of duties payment and taxation conditions related to road transport.** Cowiconsult Raadgivende Ingenioerer A/S, Lyngby (Denmark). Feb 1993. 62p. (In Danish). Order Number DE93500106. Source: OSTI; NTIS.

In relation to Danish governmental efforts to reduce energy consumption and negative environmental impacts originating from the transportation sector, a number of suggestions have been presented. Interest has increased in economical control. The aim was to describe (qualitatively) the current duty and taxation structure and identify possible faults in this structure which could relate to incitements to save energy and reduce pollution. Possible changes in the system are discussed in relation to private cars, vans and lorries. The analysis is based on calculations of annual consumer costs for the use of the various vehicles in order to be able to make comparisons possible, also to total consumer costs. The results can be summarized by giving attention to how the various duties and taxes influence people's decisions on whether to purchase a vehicle, the choice of which type of vehicle to buy, and how this will influence the total volume of traffic. This report presents the current Energy Information Administration (EIA) assessment of the long-term outlook for international energy markets. This and other EIA reports are provided as a statistical service for use by managers and international energy analysts, not as a Government energy plan. Current US Government policies and foreign government policies are assumed to hold over the projection interval, which extends to the year 2010.

26461 (PSI–93-03) **Photochemical modelling of photo-oxidant levels over the Swiss plateau and emission reduction scenarios.** Rosselet, C.M. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Kerr, J.A. Paul Scherrer Inst. (PSI), Villigen (Switzerland). May 1993. [175p.] Order Number DE93630827. Source: OSTI; NTIS; INIS.

During summertime high pressure conditions, high photo-oxidant (O_3, H_2O_2, PAN and others) levels are frequently observed in the planetary boundary layer in central Europe. It is well known that close to the earth's surface ozone is formed by complex reactions involving VOC, NO_x, and sunlight. Substantial reductions of both precursors are needed to reduce photo-oxidant levels. In this context the reductions of the abundance of the precursors and the variation of their ratios is of great importance. Here we report model calculations from the Harwell Photochemical Trajectory Model of the levels of O_3, H_2O_2 and PAN along a trajectory over the Swiss Plateau from Lake Constance to Lake Geneva. These calculations are in satisfactory agreement with measurements made during the intensive observation period of the research program POLLUMET (Pollution and Meteorology in Switzerland). Sensitivity calculations of emission reduction scenarios indicate that on the Swiss Plateau the ozone production may be mainly NO_x-limited; under conditions where the CO levels are closer to the upper limit within the range (120-600 ppbv). The calculated peak ozone level reduction caused by an exclusive NO_x-emission reduction is about three times larger than that caused by an exclusive VOC reduction. The combined reduction of all precursor compounds is the most efficient strategy, although it is only marginally more efficient than the NO_x-reduction scenario alone. 26462 (ANL/EAIS–4) **Impact on the steam electric power industry of deleting Section 316(a) of the Clean Water Act: Capital costs.** Veil, J.A. Argonne National Lab., IL (United States). Environmental Assessment and Information Sciences Div. Jan 1993. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93011233. Source: OSTI; NTIS; INIS; GPO Dep.

Many power plants discharge large volumes of cooling water. In some cases, the temperature of the discharge exceeds state thermal requirements. Section 316(a) of the Clean Water Act (CWA) allows a thermal discharger to demonstrate that less stringent thermal effluent limitations would still protect aquatic life. About 32% of total US steam electric generating capacity operates under Section 316(a) variances. In 1991, the US Senate proposed legislation that would delete Section 316(a) from the CWA. This study, presented in two companion reports, examines how this legislation would affect the steam electric power industry. This report describes alternatives available to nuclear and coal-fired plants currently operating under variances. Data from 38 plants representing 14 companies are used to estimate the national cost of implementing such alternatives. Although there are other alternatives, most affected plants would be retrofitted with cooling towers. Assuming that all plants currently operating under variances would install cooling towers, the national capital cost estimate for these retrofits ranges from $22.7 billion to $24.4 billion (in 1992 dollars). The second report quantitatively and qualitatively evaluates the energy and environmental impacts of deleting the variance. Little justification has been found for removing the Section 316(a) variance from the CWA.

26463 (DOE/CH/10093–125) **Office of Utility Technologies success stories.** National Renewable Energy Lab., Golden, CO (United States). Mar 1993. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE92001193. Source: OSTI; NTIS; GPO Dep.

In the National Energy Strategy the Department of Energy (DOE) projected that even with aggressive conservation and efficiency efforts, US electrical demand will increase from about 700 gigawatts (GW) in 1990 to nearly 900 GW by 2010. As part of this projection, the NES estimates that about 40 GW of current capacity will be retired by 2010, and another 340 GW will need to be refurbished for extended life. Thus, even if all the plant life extensions are carried out, approximately 240 GW of new capacity will be needed in that 20-year time span. Our nation's utilities have a growing number of options available for meeting this anticipated increase in demand. These options include the greater use of demand-side management techniques to further reduce the anticipated growth in demand; the provision of increasing amounts of electricity from domestic, environmentally attractive, renewable energy sources; and more effective use of the utility sector's substantial existing assets in generation, transmission, and distribution systems. The Office of Utility Technologies, part of DOE's Office of Conservation and

Renewable Energy, is working collaboratively with utilities and industry to address the technological and institutional constraints that impede utility adoption of renewable energy and energy efficiency technologies, and to realize the full market potential for these technologies, both here and abroad. This document presents brief descriptions of specific projects supported and carried out successfully by the Office of Utility Technologies as part of its effort to carry out this mission. These "success stories" range from significant research results to commercialization of new technologies. Each success story stands alone as a specific achievement, but when taken as a whole, the success stories form a collage that suggests a vision of the future for utilities.

26466 (LBL–33741) **Prospects for the power sector in nine developing countries.** Meyers, S.; Goldman, N.; Martin, N.; Friedmann, R. Lawrence Berkeley Lab., CA (United States). Apr 1993. 132p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93016712. Source: OSTI; NTIS; INIS; GPO Dep.

Based on information drawn primarily from official planning documents issued by national governments and/or utilities, the authors examined the outlook for the power sector in the year 2000 in nine countries: China, India, Indonesia, Thailand, the Philippines, South Korea, Taiwan, Argentina and Mexico. They found that the implicit rates of average annual growth of installed electric power capacity between 1991 and 2001 range from a low of 3.3% per year in Argentina to a high of 13.2% per year in Indonesia. In absolute terms, China and India account for the vast majority of the growth. The plans call for a shift in the generating mix towards coal in six of the countries, and continued strong reliance on coal in China and India. The use of natural gas is expected to increase substantially in a number of the countries. The historic movement away from oil continues, although some countries are maintaining dual-fuel capabilities. Plans call for considerable growth of nuclear power in South Korea and China and modest increases in India and Taiwan. The feasibility of the official plans varies among the countries. Lack of public capital is leading towards greater reliance on private sector participation in power projects in many of the countries. Environmental issues are becoming a more significant constraint than in the past, particularly in the case of large-scale hydropower projects. The financial and environmental constraints are leading to a rising interest in methods of improving the efficiency of electricity supply and end use. The scale of such activities is growing in most of the study countries.

26467 (LIU-TEK-LIC–93-12) **Cost-effective incentives for local electric utilities and industries in co-operation: Modelling of technical measures.** Linkoeping Studies in Science and Technology. Andersson, Maria. Linkoeping Univ. (Sweden). Dept. of Mechanical Engineering. 1993. 112 p.p. Order Number DE93500888. Source: OSTI; NTIS.

In the Swedish electricity system there is a great potential for increasing the cost efficiency of the electricity use. However, today the economic incentives, offered for instance by existing electricity rates, are too weak to improve the use of the system. The power producer, the distributor and the customer act separately due to low awareness of the costs for electricity generation, over the year and the day. If the actors are aware of the real electricity costs, cost-effective incentives will arise to introduce measures that will reduce the energy system cost considerably. This thesis presents two energy system analyses of an existing Swedish municipality. The first analysis deals with the introduction of industrial end-use measures, with the local utility's existing electricity rates as boundary conditions. The analysis is carried out with a simulation model for electricity use in industries. The second analysis deals with the introduction of energy system measures, on the municipal supply-side and demand-side, when the local electric utility and the customers are regarded as one system. The analysis is carried out with an optimisation model, which is based on linear programming. The results show that if 17 industries introduce end-use measures, with the existing electricity rates as boundary conditions, their energy system costs will be reduced by 12 MSEK for a time period of 10 years, whereas the local electric utility will increase its energy system cost by 6 MSEK. However, if there is a cooperation between the local electric utility and the customers, their joint energy system cost will be reduced by 330 MSEK for a time period of 10 years. (33 refs., 26 figs., 28 tabs.).

26468 (NEI-SE–119) **Sweden's electric power supply 1992.** KRAFTSAM, Stockholm (Sweden); Kraftverksfoereningen, Stockholm (Sweden); Vattenfall AB, Vaellingby (Sweden). 1993. 29p. (In Swedish). Order Number DE93500838. Source: OSTI; NTIS.

With 2p English summary.

In 1992 the input of energy to the Swedish energy balance was 510 TWh according to WEC-definitions. The input of fuels amounted to 257 TWh, from which only 9 TWh were used for electricity production. The end use of energy reached a total of 367 TWh, of which 133 TWh were used in industry and 151 TWh in housing, services and district heating. 83 TWh were used in the transport system. The total production of electricity was 141 TWh. The two main power sources were hydro power and nuclear power, with 73 and 61 TWh respectively in 1992. The rest, about 7 TWh, were chiefly CHP-production. Only 0.7 TWh was oil fired condensing power. In the end of 1992 the total net capacity installed in the Swedish power stations was about 34000 MW, out of which 48 per cent was hydro power, 29 per cent nuclear power and 23 per cent power based on fossil fuels and biomass. As the Swedish power production is dominated by hydro power and nuclear power, the electricity production shares of the national emissions of CO2, SO2 and NOx are very low by international standards. The emissions of CO2 from power production are about 1.5 million tons to be compared with about 60 million tons for Sweden as a whole. For SO2 and NOx the same development applies as for CO2 but even more pronounced as the national emission standards for SO2 and NOx have grown more and more rigorous during this period. (24 figs., 11 tabs.).

26469 (NUTEK-R–92-44) **Norway - effects of deregulation.** Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). Oct 1992. 62 p.p. (In Swedish). Order Number DE93500665. Source: OSTI; NTIS; INIS.

The electricity market of Norway was deregulated in 1991, changing a regional monopoly market to a national competitive market with third party access to transmission lines. In the report, the effects of the deregulations on utilities, geografical differences on prices and prices in general one year after the deregulation are analyzed. (21 figs., 35 tabs.).

26470 (PNL–8588) **Western Area Power Administration customer database.** Sandahl, L.J.; Lee, A.D.; Wright, G.A.; Durfee, D.L. Pacific Northwest Lab., Richland, WA (United States). May 1993. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93014849. Source: OSTI; NTIS; GPO Dep.

This report describes a comprehensive customer database compiled by the Pacific Northwest Laboratory (PNL) to assist with analyses conducted as part of the Western Area Power Administration Energy Planning and Management Program Environmental Impact Statement (EIS). The database was used by PNL as a tool to help select a sample of Western customers for potential participation in the Organizational Impacts Analysis case studies, and was used as part of the Utility Impact Analysis to identify sources and costs of auxiliary power. Secondary information sources were used predominantly to compile one year of system related information on the Western customers (over 600) included in the database. This information was useful for its intended purposes; however, year-to-year information may not be consistent across utilities and not all information was available for each utility.

The State Energy Data Report (SEDR) provides annual time series estimates of State-level energy consumption by major economic sector. The estimates are developed in the State Energy Data System (SEDS), which is maintained and operated by the Energy Information Administration (EIA). The goal in maintaining SEDS is to create historical time series of energy consumption by State that are defined as consistently as possible over time and across sectors. SEDS exists for two principal reasons: (1) to provide State energy consumption estimates to the Government, policy makers, and the public; and (2) to provide the historical series necessary for EIA's energy models.

26472 (LBL–32362) **Energy use in Denmark: An international perspective.** Schipper, L.; Howarth, R.; Andersson, B.; Price, L. Lawrence Berkeley Lab., CA (United States). Aug 1992. 176p. DOE Contract AC03-76SF00098. Order Number DE93015219. Source: OSTI; NTIS; GPO Dep.

This report analyzes the evolution use in Denmark since the early 1970s in order to shed light on the future path of energy use in Denmark, with particular emphasis on the role of energy efficiency. The authors found that improvements in end-use energy efficiency reduced primary energy requirements in Denmark by 22% between 1972 and 1988. Focusing on developments in six individual sectors of the Danish economy (residential, manufacturing, other industry, service, travel, and freight), they found that the residential, manufacturing, and service sectors have led the improvements in efficiency. Travel showed few significant improvements and the efficiency of freight transportation worsened. The international comparisons showed that the structure of energy use in Denmark is less energy-intensive than that of most high-income OECD countries, with the exception of Japan. Overall, they concluded that most of the energy savings achieved in Denmark were brought about through improvements in technology. They also found that an important stimulus for improved efficiency was higher energy prices, led in no small part by significant taxes imposed on small consumers of heating oil, electricity, and motor fuels. Energy-efficiency programs accelerated energy savings in homes and commercial buildings. The rate of improvement of energy efficiency in Denmark has slowed down significantly since 1984, consistent with trends observed in other major countries. While many of the energy-efficiency goals stated or implied in Denmark's Energi 2000 are achievable over a very long period, present trends do not point towards achievement of these goals by 2010 or even 2020. Strong measures will have to be developed by both public and private authorities if energy efficiency is to make a key contributions to reducing environmental problems associated with energy use in Denmark.

26473 (LBL–33166) **Trends in electricity demand and supply in the developing countries, 1980–1990.** Meyers, S.; Campbell, C. Lawrence Berkeley Lab., CA (United States). Nov 1992. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015370. Source: OSTI; NTIS; GPO Dep.

This report provides an overview of trends concerning electricity demand and supply in the developing countries in the 1980–1990 period, with special focus on 13 major countries for which we have assembled consistent data series. We describe the linkage between electricity demand and economic growth, the changing sectoral composition of electricity consumption, and changes in the mix of energy sources for electricity generation. We also cover trends in the efficiency of utility electricity supply with respect to power plant efficiency and own-use and delivery losses, and consider the trends in carbon dioxide emissions from electricity supply.

26474 (ENEA-RTI-STUDI-ENE–92-03) **MePER (Methodology in support of Regional Energy Programming).** Giuffrida, L.G. ENEA, Rome (Italy). Direzione Studi. Dec 1992. 142p. (In Italian). (RTI/STUDI-ENE–92-3). Order Number DE93799203. Source: OSTI; NTIS (US Sales Only).

In 1987, the ENEA (the Italian Agency for New Technology, Energy and the Environment) Studies Division developed and issued an instruction manual for the carrying out of Italian regional energy balance assessments. Recently revised National Energy Plan strategies which now incorporate the new European Communities environmental protection guidelines have necessitated the simplification, up-dating and broadening of the energy balance instruction manual called MePER (Methodology in support of Regional Energy Programming). The new MePER manual includes instructions for the implementation of a new information system for the compilation of modules quantifying and assessing regional energy supply and demand situations, and regional potentials for the development and use of available renewable energy sources such as mini-hydraulic, photovoltaic and eolian.

26475 (ETDE-IT–93-153) **MePER methodology: Methods and instruments for regional energy planning.** Giuffrida, L.G.; Catoni, P.G. ENEA, Rome (Italy). Direzione Studi. 1992. 8p. (CONF-921214–1: 7. international energy conference: world energy demand - is growth inevitable?, London (United Kingdom), 7-8 Dec 1992). Order Number DE93799181. Source: OSTI; NTIS (US Sales Only).

In the last ten years, energy planning has become one of the most important strategic elements in local-level government programmes. In line with this new emphasis, legislation passed in Italy in the last few years has assigned to Regional Authorities wider and wider powers of intervention in the energy sector and has specifically called on the Regions to draw up regional energy programmes concerning energy saving and the development of renewable energy sources. To aid the regions in their efforts to comply with this new legislation, ENEA (National Agency for New Technology, Energy and the Environment) put at their disposal for regional energy planning standard methodology, developed some years previously, called MePER (MEthodology for Regional Energy Planning). The principle function of MePER is to provide Regional Planning Authorities with sufficient data to enable them to draw up a set of realistic energy-related goals and objectives. In particular, MePER provides the means to: obtain base information on regional energy systems; obtain detailed information on regional energy production methods and uses; and identify energy saving and conservation measures; assess the economic and environmental impacts of these measures on the energy sector.

26476 (LA-UR–93-1991) **Hot dry rock: What does it take to make it happen.** Duchane, D.V. Los Alamos National Lab., NM

(United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930484–2: Geothermal program review, Berkeley, CA (United States), 27-29 Apr 1993). Order Number DE93014343. Source: OSTI; NTIS; INIS; GPO Dep.

The ubiquitous heat in hot dry rock (HDR) is an abundant, widely distributed form of geothermal energy. Until recently, development of this energy source has been largely focused on understanding the scientific and engineering principles involved in forming and operating HDR reservoirs. During the past year, however, a pilot facility at Fenton Hill, NM has been run under steady-state conditions simulating the operation of a commercial HDR energy plant. Issues important to commercialization such as sustainability of thermal production, water loss, operating costs, and others have been addressed to the extent possible. The results, while not always definitive, have been encouraging. The stage is now set for the formation of an initiative led by private industry to take HDR technology from its current state of scientific and engineering demonstration to the production and marketing of energy in commercial quantities. Because of the technology risks involved, this can probably only be accomplished through a cost-shared industry/government effort. The potential rewards are great, since HDR represents the best, and perhaps the only, opportunity for geothermal energy to take its rightful place as a major energy source for the 21st century.

26477 (NEI-DK–1200) **Biomass for energy and industry.** Rockson, J.K. Nordvestjysk Folkecenter for Vedvarende Energi, Hurup (Denmark). Oct 1992. 97p. Order Number DE93500179. Source: OSTI; NTIS.

Economic and environmental seasons require the substitution of fossil resources with renewable ones. This substitution must be such that it provides both energy and environmental advantages. It must also be a sustainable innovation, i.e. it must not prejudice the availability of other resources in the biosphere. At present it seems that the best prospects for the substitution of fossil resources and for the maintenance of the delicate biosphere equilibria seems to be the capture of solar energy by photosynthesis, biomass and wind energy i.e. energy derived from the sun (aeolic, hydro, direct solar radiation, biomass). As regards suitability for biogas production, organic substrates could be divided into four main categories, i.e. animal wastes, agricultural residues, industrial wastes and wood fuel. Temperature plays an important part in biogas production due to the fermentation process, which leads to the gas production. In many respects H_2S is not an attractive energy medium. H_2S is dangerous to every metal or material since it reduces the lifespan of every material, metal or element that comes in contact with. The removal of H_2S with the addition of $FeCl_2$ is therefore a great achievement especially for biogas production and for biogas plants. The $FeCl_2$ combines with the H_2S which runs out with the gas. (au).

26478 (DOE/PC/90309–10) **Anion-exchange resin-based desulfurization process: Quarterly technical progress report, January 1, 1993–March 31, 1993.** Sheth, A.C.; Dharmapurikar, R. Tennessee Univ., Tullahoma, TN (United States). Space Inst. [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90309. Order Number DE93014520. Source: OSTI; NTIS; GPO Dep.

Under DOE Grant No. FG22-90PC90309, the University of Tennessee Space Institute (UTSI) is contracted to further develop its anion-exchange, resin-based desulfurization concept to desulfurize alkali metal sulfates. From environmental as well as economic viewpoints, it is necessary to remove soluble sulfates from the wastes created by flue gas desulfurization systems. In order to do this economically, a low-cost desulfurization process for spent sorbents is necessary. UTSI's anion-exchange resin-based desulfurization concept is believed to satisfy these requirements. UTSI has completed the batch mode experiments to locate the position of the CO_3^{2} and SO_4^{2} ions in the affinity chart. Also, the reviews of the ASPEN Code's capabilities and EPRI-TAG document's methodology are in progress for developing the Best Process Schematic and related economics. The fixed-bed experiments are also in progress to evaluate the cycle efficiency of the candidate resins. So far we have completed ten consecutive cycles of exhaustion/carbonation and regeneration for IRA-35 resin. Because of the past problems (now resolved) with the fixed-bed system, the addition of batch mode screening experiments, Christmas holidays and spring break, and the moving of UTSI's Chemistry Laboratory to a new location, the program is about 6–8 weeks behind schedule, but well within the budget.

26479 (DOE/MC/27168–93/C0188) **Carbonate fuel cell endurance: Hardware corrosion and electrolyte management status.** Yuh, C.; Johnsen, R.; Farooque, M.; Maru, H. Energy Research Corp., Danbury, CT (United States). [1993]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-90MC27168. (CONF-930571–13: 183. Electrochemical Society meeting, Honolulu, HI (United States), 16-21 May 1993). Order Number DE93013800. Source: OSTI; NTIS; GPO Dep.

Endurance tests of carbonate fuel cell stacks (up to 10,000 hours) have shown that hardware corrosion and electrolyte losses can be reasonably controlled by proper material selection and cell design. Corrosion of stainless steel current collector hardware, nickel clad bipolar plate and aluminized wet seal show rates within acceptable limits. Electrolyte loss rate to current collector surface has been minimized by reducing exposed current collector surface area. Electrolyte evaporation loss appears tolerable. Electrolyte redistribution has been restrained by proper design of manifold seals.

26480 (DOE/MC/27168–93/C0189) **Performance effects of coal-derived contaminants on the carbonate fuel cell.** Pigeaud, A. (Energy Research Corp., Danbury, CT (United States)); Wilemski, G. Energy Research Corp., Danbury, CT (United States). [1993]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-90MC27168. (CONF-9305101–1: 3. international symposium on carbonate fuel cell technology, Honolulu, HI (United States), 16-21 May 1993). Order Number DE93013801. Source: OSTI; NTIS; GPO Dep.

Coal-derived contaminant studies have been pursued at ERC since the early 1980's when the pace of carbonate fuel cell development began to markedly increase. Initial work was concerned with performance effects on laboratory and bench-scale carbonate fuel cells primarily due to sulfur compounds. Results have now also been obtained with respect to nine additional coal-gas contaminants, including volatile trace metal species. Thermochemical calculations, out-of-cell experiments, and cell performance as well as endurance testshave recently been conducted which have involved the following species: NH_3, H_2S [COS], HCl, $AsH_3[As_2(v)]$, Zn(v), Pb(v), Cd(v), H_2 Se, Hg(v), Sn(v). Employing thermochemically calculated results, thermogravimetric (TGA) and pre-, and post-test analytical data as well as fuel cell performance observations, it has been shown that there are four main mechanisms of contaminant interaction with the carbonate fuel cell. These have been formulated into performance models for six significant contaminant species, thus providing long-term endurance estimations.

26481 (DOE/MC/28065–3371) **Molten carbonate fuel cell product development test environmental assessment/protection plan.** M-C Power Corp., Burr Ridge, IL (United States). Nov 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC28065. Order Number DE93000288. Source: OSTI; NTIS; GPO Dep.

Objective of proposed action is to conduct a 250-kW product development test of M-C Power Corporation's molten carbonate fuel cell concept, at the Kaiser Permanente San Diego Medical Center.

Review of environmental impacts of this test indicate the following: no impact on solid waste disposal, water quality, noise levels, floodplains, wetlands, ecology, historic areas, or socioeconomic resources. Impact on air quality are expected to be positive.

26482 (DOE/METC/C–93/7083) **Status of SOFC development in USA.** Hooie, D.T. USDOE Morgantown Energy Technology Center, WV (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). (CONF-9305101–3: 3. international symposium on carbonate fuel cell technology, Honolulu, HI (United States), 16-21 May 1993). Order Number DE93015568. Source: OSTI; NTIS; GPO Dep.

Solid oxide fuel cells represent a highly efficient power generation/cogeneration source in the United States and worldwide. Currently, the US is a leader in this technology in the tubular, monolithic and planar solid oxide fuel cell areas. In addition, research is being conducted in intermediate temperature solid oxide fuel cells. An overview of the status of these technologies, research, and critical issues is presented.

26483 (LA-UR–93-1305) **Primary and secondary electrical space power based on advanced PEM systems.** Vanderborgh, N.E. (Los Alamos National Lab., NM (United States)); Hedstrom, J.C.; Stroh, K.R.; Huff, J.R. Los Alamos National Lab., NM (United States). [1993]. 9p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9304142–1: 4. space electrochemical research and technology conference, Cleveland, OH (United States), 14-15 Apr 1993). Order Number DE93012643. Source: OSTI; NTIS; GPO Dep.

For new space ventures, power continues to be a pacing function for mission planning and experiment endurance. Although electrochemical power is a well demonstrated space power technology, current hardware limitations impact future mission viability. In order to document and augment electrochemical technology, a series of experiments for the National Aeronautics and Space Administration Lewis Research Center (NASA LeRC) are underway at the Los Alamos National Laboratory that define operational parameters on contemporary proton exchange membrane (PEM) hardware operating with hydrogen and oxygen reactants. Because of the high efficiency possible for water electrolysis, this hardware is also thought part of a secondary battery design built around stored reactants – the so-called regenerative fuel cell. An overview of stack testing at Los Alamos, and of analyses related to regenerative fuel cell systems are provided in this paper. Finally, this paper describes work looking at innovative concepts that remove complexity from stack hardware with the specific intent of higher system reliability. This new concept offers the potential for unprecedented electrochemical power system energy densities.

26484 (NEI-DK–1194) **Abstracts of Nordisk Ministerraads workshop on high temperature electrode materials.** Poulsen, F.W.; Ahlgren, E.; Holt, A. (eds.). Risoe National Lab., Roskilde (Denmark). Materials Dept. Dec 1992. 194 p.p. (CONF-9210373–Absts.: Workshop on high temperature electrode materials, Roskilde (Denmark), 26-27 Oct 1992). Order Number DE93500259. Source: OSTI; NTIS.

Abstracts of papers presented at The Nordic Council of Ministers workshop held in Roskilde, Denmark, in October 1992 deal with ceramic electrodes used in solid oxide (SOFC) and molten carbonate fuel cells (MCFC). Participants originated from Norway, Denmark, the Netherlands and the United Kingdom. The eleven lectures ranged under the headings of structure and thermodynamics, transport properties, kinetics and general SOFC technology. The state of the art of SOFCs was also generally discussed, and an overview of materials research related to MCFC was given. (AB).

Simulations of the defect chemistry are presented for $LaMnO_{3+\delta}$, $La_{1-x}Sr_xMn_yO_{3+\delta}$ and $Nd_xCr_{1-y}Ti_yO_{3+\delta}$. Contrary to previous defect chemistry calculations (Kroeger-Vink diagram type) a complete numerical solution to the problem has been found, avoiding the problem of dividing the diagram into sub-problems and using approximated equations for the various defect regimes. The transition regions, which may extend over several decades of oxygen partial pressure, become subjectable to analysis and prediction. Three equilibrium constants are required in the description of perovskites: a redox type-, a Schottky type-, and an ionisation type constant. The set of 8 or 9 equations controlling the host ion- and defect concentrations are solved by a trial and error method: the oxygen ion vacancy concentration is stepped through its parametric space (approx. 10^{-10} to 1) and an intelligent criterium for eliminating the non-physical solutions is used. A warning against use of commercial PC-"equation solving packages" is given. When these work, they are slower than the present procedure. The present algorithm is capable of synthesising K.-V.-diagrams over at least 50 decades of oxygen pressures. Perovskites with pure electrolyte properties, as well as pure p-type material can be simulated. The oxygen content vs pO_2 relationship is correctly predicted as well as the slopes in the K.-V.-diagrams. The idea of also using a "differentiated K.-V.-diagram" i.e. a $d\log(c)/d\log pO_2$ vs $\log pO_2$ diagram is advocated. The slopes may converge towards "peculiar" numbers for certain combinations of equilibrium constants, without this meaning that a completely new type of defect must be invoked. (AB).

26486 (NEI-DK–1194, pp. 27-32) **Stoichiometry and structure of (La,Sr)MnO_3.** Skou, E. (Department of Chemistry, Odense University, Odense (Denmark)). Risoe National Lab., Roskilde (Denmark). Materials Dept. Dec 1992. (CONF-9210373–Absts.: Workshop on high temperature electrode materials, Roskilde (Denmark), 26-27 Oct 1992). In *Abstracts of Nordisk Ministerraads workshop on high temperature electrode materials.* 194 p.p. Order Number DE93500259. Source: OSTI; NTIS.

In the literature the dependency of stoichiometry of LSM (belonging to the family of perovskites with the general formula ABO_3) on the partial pressure of oxygen has usually been determined by thermogravimetry. In these investigations nominal stoichiometry (i.e. $O_{3.00}$) is usually assumed as an oxygen partial pressure of 10^{-9} to 10^{-6} atm where the composition is independent of the partial pressure, but no direct proof of this has been given. It was therefore decided to determine the absolute composition of selected samples equilibrated at different oxygen partial pressures. Physical methods (atomic absorption and X-ray fluorescence) was judged to be too inaccurate so a chemical analysis was attempted. On a selected sample the stoichiometry was also determined by a Rietveld refinement on X-ray and neutron powder diffraction data. In addition phase stability and unit cell volumes have been determined by X-ray powder diffraction. (AB).

Measurements of the ionic conductivity of $La_{0.7}Ca_{0.3}Cr_{0.95}Ca_{0.05}O_3$ has been attempted using a set-up with stabilized zirconia blocking for electronic charge transport. The calculated activation energy for ionic conductivity was 0.89 eV, which was in reasonable agreement with literature results. However, oxygen dependency measurements gave results diverging from what was expected for oxygen vacancy migration, and instead followed the oxygen dependency of p-type conductivity. It is therefore believed that the method failed in our case, as the measured conductivity represented a fraction of the p-type conductivity. There was nevertheless reasonable correspondence between our results and results in the literature. (au).

26490 (NEI-DK–1194, pp. 105-121) **On the measurement and interpretation of transport properties of mixed conductors.** Nisancioglu, K. (Norges Tekniske Hoegskole, Institutt for Teknisk Elektrokjemi, Trondheim (Norway)). Risoe National Lab., Roskilde (Denmark). Materials Dept. Dec 1992. (CONF-9210373–Absts.: Workshop on high temperature electrode materials, Roskilde (Denmark), 26-27 Oct 1992). It is generally agreed that the ionic transport properties of mixed conductors can directly be measured by tracer techniques, which normally require one specimen per measurement. Since electrochemical and non-destructive gravimetric methods are frequently applied because these methods in principle allow infinite number of measurements; however data interpretation is less straightforward. This paper, therefore, reviews the theoretical basis for the determination of transport properties by these methods, with emphasis on the type of assumptions involved and the physical significance of the measured quantities. The detailed mechanism has not been established for the overall cathode reaction $O_2+4e \rightleftharpoons 2O^{--}$. We assume that the reaction is distributed on to the surface of the porous electrode. The driving force for the electrochemical reaction is the perturbation of the oxide concentration at the reaction site. For electrode materials with high electronic conductivity, the distribution of the reaction density is determined by the concentration profile of the O^{--} ions produced. This is determined by the transport from the reaction site to the surface of the zirconia electrolyte. This diffusion can be surface and/or, in the case of an ion conducting electrode material, bulk diffusion. A simple mathematical treatment identifies two limiting cases: Thin electrodes, where the surface reaction is the rate limiting step, have a uniform distribution of the reaction density on the surface and they behave as conventional planar electrodes. Thick electrodes, where the diffusion of O^{--} is limiting and the reaction density decreases with the distance from the electrolyte surface. These, behave as porous electrodes and measurable quantities like reaction orders differ from those expected from planar electrode theory. An electrochemical impedance technique applied to a dense LSM pellet inside an oxygen pumping cell is described. From these experiments, information on the surface reaction as well as the O^{--} bulk diffusion coefficient can be obtained. (AB).

26496 (PNL-SA–21621) **Chemical interactions between interconnect and electrode materials during sintering in solid oxide fuel cells.** Armstrong, T.R.; Chick, L.A.; Bates, J.L. Pacific Northwest Lab., Richland, WA (United States). May 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9305100–2: 3. international symposium on solid oxide fuel cells, Honolulu, HI (United States), 16-21 May 1993). Order Number DE93015696. Source: OSTI; NTIS; GPO Dep.

Chemical interactions and interdiffusion between the interconnect, $(LaCa)CrO_3$ and $(YCa)CrO_3$ and the anode, $Ni{\cdot}ZrO_2$, and cathode, $(LaSr)MnO_3$ and $(YCa)MnO_3$, were evaluated from 1300 to 1500C. Reaction of $(LaCa)CrO_3$ and $Ni{\cdot}ZrO_2$ cermet resulted in the formation of $NiCr_2O_4$ spinel, while reaction of $(YCa)CrO_3$ and

Ni·ZrO_2 resulted in the formation of both $NiCr_2O_4$ and $CaZrO_3$, at all temperatures. Interactions between the chromites and manganites resulted in the formation of a solid solution. Dense reaction layers were observed near the interface of Ni·ZrO_2/(LaCa)CrO_3 and Ni·ZrO_2/(YCa)CrO_3 samples. These dense regions were enriched in calcium and chromium, resulting from liquid migration from the chromite to the anode. Nearly ideal interfaces were observed between (LaSr)MnO_3 and (LaCa)CrO_3. Interactions between (YCa)CrO_3 and (YCa)MnO_3 resulted in the formation of a $CaCrO_4$ rich layer along the interface.

32 ENERGY CONSERVATION, CONSUMPTION, AND UTILIZATION

26497 (ORNL/CON–353) **Evaluation of the utility and energy monitoring and control system installed at the US Army, Europe, 409th Base Support Battalion, Military Community at Grafenwoehr, Germany.** Broders, M.A.; Ruppel, F.R. Oak Ridge National Lab., TN (United States). May 1993. 49p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93015633. Source: OSTI; NTIS; GPO Dep.

Under the provisions of Interagency Agreement DOE 1938-B090-A1 between the US Department of Energy (DOE) and the US Army Europe (USAREUR), Martin Marietta Energy Systems, Inc., is providing technical assistance to USAREUR in the areas of computer science, information engineering, energy studies, and engineering and systems development. One of the initial projects authorized under this interagency agreement is the evaluation of utility and energy monitoring and control systems (UEMCSs) installed at selected US Army installations in Europe. This report is an evaluation of the overall energy-conservation effectiveness and use of the UEMCS at the 409th Base Support Battalion located in Grafenwoehr, Germany. The 409th Base Support Battalion is a large USAREUR military training facility that comprises a large training area, leased housing, the main post area, and the camp areas that include Camps Aachen, Algier, Normandy, Cheb, and Kasserine. All of these facilities are consumers of electrical and thermal energy. However, only buildings and facilities in the main post area and Camps Aachen, Algier, and Normandy are under the control of the UEMCS. The focus of this evaluation report is on these specific areas. Recommendations to further increase energy and cost savings and to improve operation of the UEMCS are proposed.

26498 (DOE/BP–1574-Ed.2) **Building commissioning guidelines: Second edition.** Portland Energy Conservation, Inc., OR (United States). Nov 1992. 141p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012213. Source: OSTI; NTIS; GPO Dep.

Commissioning has been a neglected element in the design, construction, and operation of buildings. Commissioning is a process for achieving, verifying, and documenting that the performance of a building and its various systems meets design intent and the owner's operational needs. Ideally, the commissioning process extends through all phases of a project, from conception to occupancy and operation. This document is written specifically to be used by utility program managers and staff. It should also be read by the utility technical staff and utility contractors responsible for delivering commissioning services, in order for them to better understand the overall commissioning process. The appendices are primarily oriented to the utility technical staff and utility contractors responsible for actually implementing commissioning. The objective of the appendices is to provide samples of forms and formats that will help streamline the implementation process.

26499 (DOE/CH/10093–187) **Program overview – Envelope systems research.** National Renewable Energy Lab., Golden, CO (United States). Apr 1993. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93013277. Source: OSTI; NTIS; GPO Dep.

The Envelope Systems Research of the Office of Building Technologies of US DOE is reviewed briefly. Current research on the building envelope and the work of the Building Envelope Research Center located at ORNL are included.

26500 (DOE/ER/45461–12) **Prediction of pitting damage functions for condensing heat exchangers.** Macdonald, D.D.; Liu, Chun; Urquidi-Macdonald, M. Pennsylvania State Univ., University Park, PA (United States). [1993]. 17p. Sponsored by USDOE, Washington, DC (United States); Gas Research Inst., Chicago, IL (United States). DOE Contract FG02-91ER45461. 5090-260-1969. (CONF-930998–3: Fall committee week of the National Association of Corrosion Engineers, Houston, TX (United States), 26 Sep - 1 oct 1993). Order Number DE93012923. Source: OSTI; NTIS; INIS; GPO Dep.

Pitting corrosion is a form of extremely localized attack resulting in rapid penetration into a metal substrate, and is one of the most destructive and insidious forms of corrosion that occurs in industrial systems. Traditionally, the damage function, i.e., the number of pits versus the pit depth, is measured experimentally, and the development of damage is described using empirical models. In general, the empirical models are successful because the distribution functions employed display great mathematical flexibility, but they require a significant database to achieve reliability. In fact, they are only really successful when the answer is known in advance. In this study, we developed a deterministic method for predicting localized corrosion damage functions for condensing heat exchangers. The method incorporates calculations for the composition of the condensed environment and the electrochemical corrosion potential of the alloy, and includes mechanistic treatments of the nucleation and the growth of pits. The role of the important environmental parameters are identified, such as the chloride concentration and the partial pressure of oxygen. Good agreement is observed between the predicted damage functions and the experimental data.

26501 (DOE/FTR–93012815) **[A meeting in Finland on innovative low-energy concepts for the year 2025]: Foreign trip report, August 30–September 6, 1992.** Rivera, J.D. DOE Contract AC06-76RL01830. Order Number DE93012815. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of the Future Buildings Forum - "2025" (Forum) is to identify and encourage research, based on long-term issues, to ensure that buildings will contribute to a sustainable society by the year 2025, and beyond. Two to three workshops are held each year on areas germane to buildings of the future.

26502 (EPA–600/R-92-203) **Literature review: Heat transfer through two-phase insulation systems consisting of powders in a continuous gas phase.** Yarbrough, D.W. Oak Ridge National Lab., TN (United States). Dec 1992. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/M–2426). Order Number DE93014387. Source: OSTI; NTIS; GPO Dep.

This review of the literature on heat flow through powders was motivated by the use of fine powder systems to produce high thermal resistivities (thermal resistance per unit thickness). The term "superinsulations" has been used to describe this type of material, which has thermal resistivities in excess of 20 $ft^2 \cdot h \cdot F/Btu$ (3.52 $K \cdot m^2/W$) per inch (2.54 cm) of insulation thickness. The present report is concerned with superinsulations obtained using evacuated powders. The literature review has shown that the calculation of heat flow through gas-powder systems is highly developed. One major weakness in the calculational procedures is the absence of structural features for the powders, which are invariably characterized as regular arrays of spheres or cubes rather than random irregularly shaped particles. The effect of particle size distribution on the shape and size of void spaces is not modeled, although it affects the thermal conductivity of the gas. Calculations of thermal performance based on simplified descriptions of the porosity distribution can be used to show the dependence of thermal resistance on interstitial gas pressure. The literature reviewed in this report provides a basis for predicting the interstitial gas pressure at which

thermal conductivity begins to increase. The objective is to design filler material for powder insulation systems with ultrafine void spaces that will permit pressure increases without dramatic thermal conductivity increases.

26503 (ETSU-S–1353) **Daylighting in the building regulations: a feasibility study.** Pickering, M.; Orrell, R. NBA Tectonics, London (United Kingdom). 1993. 98p. Order Number DE93504804. Source: OSTI; NTIS (US Sales Only).

The study has shown that on grounds of cost effectiveness and energy savings, there is a strong case for introducing new requirements into the Building Regulations that could set a minimum average efficacy for electric lighting and require lighting controls to be installed. The requirements would apply only to non-domestic buildings. A summary of the proposed regulatory measures, including their benefits and drawbacks, is given. These two measures would produce an estimated annual saving of 24% of the lighting energy used in non-domestic building compared to current practice. This saving would be effective from the time the Regulations came into operation. If the measures were introduced into the Building Regulation in 1993, then by 2030 the estimated annual savings in electricity consumption would be about 4,000 GWh a year (worth about 275 million pounds at todays prices and equivalent to a reduction of about 3.2 million tonnes of CO_2 a year). (author)

26504 (LBL–30508) **Residential energy use and conservation in Venezuela: Results and implications of a household survey in Caracas.** Figueroa, M.J.; Ketoff, A.; Masera, O. Lawrence Berkeley Lab., CA (United States). Oct 1992. 66p. Sponsored by Petroleos de Venezuela S.A. DOE Contract AC03-76SF00098. Order Number DE93015372. Source: OSTI; NTIS; GPO Dep.

This document presents the final report of a study of residential energy use in Caracas, the capital of Venezuela. It contains the findings of a household energy-use survey held in Caracas in 1988 and examines options for introducing energy conservation measures in the Venezuelan residential sector. Oil exports form the backbone of the Venezuelan economy. Improving energy efficiency in Venezuela will help free domestic oil resources that can be sold to the rest of the world. Energy conservation will also contribute to a faster recovery of the economy by reducing the need for major investments in new energy facilities, allowing the Venezuelan government to direct its financial investments towards other areas of development. Local environmental benefits will constitute an important additional by-product of implementing energy-efficiency policies in Venezuela. Caracas's residential sector shows great potential for energy conservation. The sector is characterized by high saturation levels of major appliances, inefficiency of appliances available in the market, and by careless patterns of energy use. Household energy use per capita average 6.5 GJ/per year which is higher than most cities in developing countries; most of this energy is used for cooking. Electricity accounts for 41% of all energy use, while LPG and natural gas constitute the remainder. Specific options for inducing energy conservation and energy efficiency in Caracas's residential sector include energy-pricing policies, fuel switching, particularly from electricity to gas, improving the energy performance of new appliances and customer information. To ensure the accomplishment of an energy-efficiency strategy, a concerted effort by energy users, manufacturers, utility companies, government agencies, and research institutions will be needed.

26505 (LBL–32380-Vol.1) **ASEAN-USAID buildings energy conservation project: Volume 1, Energy standards: Final report.** Levine, M.D. (Lawrence Berkeley Lab., CA (United States)); Busch, J.F. (eds.); Deringer, J.J. Lawrence Berkeley Lab., CA (United States). Jun 1992. 122p. Sponsored by Agency for International Development, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015245. Source: OSTI; NTIS; GPO Dep.

Mandatory or voluntary energy-efficiency standards for new or existing buildings can play an important role in a national program aimed at promoting energy conservation. Building codes and standards can provide a degree of control over design and building practices throughout the construction process, and encourage awareness of energy-conscious design. Studies in developed countries indicate that efficiency standards can produce energy reductions on the order of 20 to 40% or more. Within ASEAN, analyses of the savings potential from the proposed standards suggest that if implemented, these standards would produce savings over current new design practice of 19% to 24%. In this volume we provide an overview of the ASEAN-USAID project aimed at promulgating standards for energy efficiency in commercial buildings. The process of developing and implementing energy-efficiency standards for buildings can be subdivided into two key components: policy development; and technical and economic analysis. Each of these involves a number of steps and processes, as outlined in Figure 1-1. This volume describes the technical and economic analyses used to develop the proposed energy efficiency standards for four countries (Malaysia, Thailand, the Philippines, and Indonesia), and to refine an energy standard existing in Singapore since 1979. Though oriented toward the ASEAN region, the analysis methods described here are applicable in a range of settings, provided appropriate modifications are made for local building construction, climatic, economic, and political conditions. Implementation issues are not specifically addressed here; rather this volume is oriented towards the analytical work needed to establish or revise an energy standard for buildings.

26506 (LBL–32826) **Preliminary evaluation of the performance, water use, and current application trends of evaporative coolers in California climates.** Huang, Y.J.; Hanford, J.W.; Wu, H.F. Lawrence Berkeley Lab., CA (United States). Sep 1992. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015235. Source: OSTI; NTIS; GPO Dep.

This paper describes the latest results of an ongoing analysis investigating the potential for evaporative cooling as an energy-efficient alternative to standard air-conditioning in California residences. In particular, the study uses detailed numerical models of evaporative coolers linked with the DOE-2 building energy simulation program to study the issues of indoor comfort, energy and peak demand savings with and without supplemental air-conditioning and consumptive water use. In addition, limited surveys are used to assess the current market availability of evaporative cooling in California, typical contractor practices and costs, and general acceptance of the technology among engineers, contractors, and manufacturers. The results show that evaporative coolers can provide significant energy and peak demand savings in California residences, but the impact of the increased indoor humidity on human comfort remains an unanswered question that requires further research and clarification. Evaluated against ASHRAE comfort standards developed primarily for air-conditioning both direct and two-stage evaporative coolers would not maintain comfort at peak cooling conditions due to excessive humidity. However, using bioclimatic charts that place human comfort at the 80% relative humidity line, the study suggests that direct evaporative coolers will work in mild coastal climates, while two-stage models should provide adequate comfort in Title 24 houses throughout California, except in the Imperial Valley. The study also shows that evaporative coolers will increase household water consumption by less than 6% on an annual basis, and as much as 23% during peak cooling months, and that the increases in water cost are minimal compared to the electricity savings. Lastly, a survey of engineers and contractors revealed generally positive experiences with evaporative coolers, with operational cost savings, improved comfort, unproved air quality as the primary benefits in their use.

26507 (LBL–33075) **Impact assessment and performance targets for lighting and envelope systems.** Sullivan, R.; Lee, E.S.; Selkowitz, S. Lawrence Berkeley Lab., CA (United States). Jun 1992. 41p. Sponsored by USDOE, Washington, DC (United States); California Inst. for Energy Efficiency, Berkeley, CA (United States). DOE Contract AC03-76SF00098. (BS–295). Order Number DE93015233. Source: OSTI; NTIS; GPO Dep.

Electric lighting loads and cooling from solar heat gains and from lights are the two largest components of peak demand in commercial buildings. The most cost effective demand side management solutions are generally those that directly reduce or eliminate these loads. Existing technologies can provide modest reductions, however they are typically applied an a piecemeal manner that yields

less than optimal results. The full potential of existing technologies will be realized when they are commercially available in an integrated package easily specifiable by architects and engineers. Emerging technologies can also be developed to provide even greater savings and extend the savings over a greater portion of the building floor area. This report assesses achievable energy and peak demand performance in California commercial buildings with technologies available today and in the future. We characterize energy performance over a large range of building envelope and lighting conditions, both through computer simulation models and through case study measured data, and subsequently determine reasonable energy targets if building design were further optimized with integrated systems of current or new technologies. Energy targets are derived from the study after consideration of industry priorities, design constraints, market forces, energy code influence, and the state of current building stock.

26508 (LBL–33201) **Technology reviews: Shading systems.** Schuman, J.; Rubinstein, F.; Papamichael, K.; Beltran, L.; Lee, E.S.; Selkowitz, S. Lawrence Berkeley Lab., CA (United States). Sep 1992. 11p. Sponsored by USDOE, Washington, DC (United States); California Inst. for Energy Efficiency, Berkeley, CA (United States). DOE Contract AC03-76SF00098. Order Number DE93015240. Source: OSTI; NTIS; GPO Dep.

We present a representative review of existing, emerging, and future technology options in each of five hardware and systems areas in envelope and lighting technologies: lighting systems, glazing systems, shading systems, daylighting optical systems, and dynamic curtain wall systems. The term technology is used here to describe any design choice for energy efficiency, ranging from individual components to more complex systems to general design strategies. The purpose of this task is to characterize the state of the art in envelope and lighting technologies in order to identify those with promise for advanced integrated systems, with an emphasis on California commercial buildings. For each technology category, the following activities have been attempted to the extent possible: Identify key performance characteristics and criteria for each technology. Determine the performance range of available technologies. Identify the most promising technologies and promising trends in technology advances. Examine market forces and market trends. Develop a continuously growing in-house database to be used throughout the project. A variety of information sources have been used in these technology characterizations, including miscellaneous periodicals, manufacturer catalogs and cut sheets, other research documents, and data from previous computer simulations. We include these different sources in order to best show the type and variety of data available, however publication here does not imply our guarantee of these data. Within each category, several broad classes are identified, and within each class we examine the generic individual technologies that fall into that class.

26509 (LBL–33772) **Global residential appliance standards.** Turiel, I. (Lawrence Berkeley Lab., CA (US)); McMahon, J.E.; Lebot, B. Lawrence Berkeley Lab., CA (United States). Mar 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9306174–2: European Council for an energy-efficient economy summer study, Rungstedgaard (Denmark), 1-5 Jun 1993). Order Number DE93015045. Source: OSTI; NTIS; GPO Dep.

In most countries, residential electricity consumption typically ranges from 20% to 40% of total electricity consumption. This energy is used for heating, cooling, refrigeration and other end-uses. Significant energy savings are possible if new appliance purchases are for models with higher efficiency than that of existing models. There are several ways to ensure or encourage such an outcome, for example, appliance rebates, innovative procurement, and minimum efficiency standards. This paper focuses on the latter approach. At the present time, the US is the only country with comprehensive appliance energy efficiency standards. However, many other countries, such as Australia, Canada, the European Community (EC), Japan and Korea, are considering enacting standards. The greatest potential impact of minimum efficiency standards for appliances is in the developing countries (e.g., China and India), where saturations of household appliances are relatively low but growing rapidly. This paper discusses the potential savings that could be achieved from global appliance efficiency standards for refrigerators and freezers. It also could be achieved from global appliance efficiency standards for refrigerators and freezers. It also discusses the impediments to establishing common standards for certain appliance types, such as differing test procedures, characteristics, and fuel prices. A methodology for establishing global efficiency standards for refrigerators and freezers is described.

26510 (LBL–33945) **Simulating the daylight performance of fenestration systems and spaces of arbitrary complexity: The IDC method.** Papamichael, K.; Beltran, L. Lawrence Berkeley Lab., CA (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States); California Inst. for Energy Efficiency, Berkeley, CA (United States). DOE Contract AC03-76SF00098. (CONF-9308111–1: 3. international conference of the International Building Performance Simulation Association, Adelaide (Australia), 16-18 Aug 1993). Order Number DE93015177. Source: OSTI; NTIS; GPO Dep.

A new method to simulate the daylight performance of fenestration systems and spaces is presented. This new method, named IDC (Integration of Directional Coefficients), allows the simulation of the daylight performance of fenestration systems and spaces of arbitrary complexity, under any sun, sky and ground conditions. The IDC method is based on the combination of scale model photometry and computer-based simulation. Physical scale models are used to experimentally determine a comprehensive set of "directional illuminance coefficients" at reference points of interest, which are then used in analytical, computer-based routines, to determine daylight factors or actual daylight illuminance values under any sun, sky and ground conditions. The main advantage of the IDC method is its applicability to any optically complex environment. Moreover, the computer-based analytical routines are fast enough to allow for hourly simulation of the daylight performance over the course of an entire year. However, the method requires appropriate experimental facilities for the determination of the Directional Coefficients. The IDC method has been implemented and used successfully in inter-validation procedures with various daylight simulation computer programs. Currently, it is used to simulate the daylight performance of fenestration systems that incorporate optically comp1ex components, such as Venetian blinds, optically treated light shelves and light pipes.

26511 (LUTMDN-TMVK–3149) **Experimental investigation of a condensing boiler with a Thermomax burner and flue gas reheating.** Naeslund, M. Lund Univ. (Sweden). Dept. of Heat and Power Engineering. Mar 1993. 31p. Order Number DE93500689. Source: OSTI; NTIS.

Flue gas reheating in small gas fired condensing boilers provides an alternative to a corrosion resistant chimney liner. This report discusses reheating and how it can be coupled to the boiler, the building and the heating system. Experiments involving one of the suggested boiler designs are described. An experimental boiler was designed for this purpose. The boiler consists of a circular burner and a finned heat exchanger tube wound around the burner. Without reheating the boiler showed an efficiency of about 95 % at a 3.5-8 kW heat load. The efficiencies at the same loads, using reheating, were measured at 70-75 %. The low boiler efficiency with reheating can be explained by high heat losses. Since the cause for the heat losses is known no more tests were made, The efficiency can be considerably increased by added heat insulation. Too great a degree of reheating also accounted for a part of this low efficiency. The report ends with a couple of design criteria for the favourable operation of a small, gas fired condensing boiler using flue gas reheating: the criteria being limited to this design. (7 refs., 20 figs., 6 tabs.).

26512 (NEI-DK–1217) **Green plan of maintenance: Maintenance and resource savings in the cooperative housing association building at Bissensgade/Lundbyesgade, Aarhus.** Nellemann Raadgivende Ingenioerer og Planlaeggere A/S, Aarhus (Denmark). May 1991. 44p. (In Danish). Contract ENS-UVE-90.0119. Order Number DE93500337. Source: OSTI; NTIS.

The project's aim was to work out a step-by-step plan of maintenance for the Bissensgade/Lundbyesgade property based on an analysis of the best solutions in relation to available resources and

costs. The various methods for saving water, cutting down on heating and local management of household wastes are compared. The building was constructed in 1926 and is located in the center of the town. It contains 30 rented flats, each with 2-3 rooms plus a bathroom and a lavatory. It is served by a district heating plant. The current condition is described in addition to suggested methods of saving energy etc. Ways of persuading the inhabitants of the cost benefits of these initiatives are discussed. The actual plan of maintenance is described in detail. Elements of this plan, in addition to construction repairs, are thermal insulation, heat recovery in relation to water heating, and the use of solar energy as supplementary heating in the summer. (AB).

26513 (PNL–8705) **DOE standard compliance demonstration program: An office building example.** Bailey, S.A.; Keller, J.M.; Wrench, L.E.; Williams, C.J. Pacific Northwest Lab., Richland, WA (United States). Jun 1993. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93017527. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy (DOE) issued interim new building energy standards (10 CFR 435 1989) to achieve maximum energy efficiency in the designs of new buildings. DOE then entered into a project to demonstrate and assess the impact of these standards on the design community. One area of focus was a test to see how a less conventional design-focused building would meet the standards' requirements – DOE wanted to demonstrate that compliance with energy standards does not mean compromising the architectural intent of a building. This study, which was initiated at Pacific Northwest Laboratory (PNL), illustrated the process by which compliance with the standards can be proven for a highly "design-oriented" office building. The study also assessed the impact of the whole building simulation compliance alternatives on design. This report documents the compliance requirements, gives a description of the sample building chosen for the study, provides general guidance for the compliance process, documents the method of compliance that was undertaken for the sample building, presents the results of the study, and provides a recommendation on how the compliance requirements could be improved to reflect more realistic use types.

26514 (PNL–8715) **Results from an energy-efficient showerhead field study.** Warwick, W.M.; Bailey, S.A. Pacific Northwest Lab., Richland, WA (United States). Jun 1993. 68p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93017525. Source: OSTI; NTIS; GPO Dep.

In 1991 the Bonneville Power Administration (Bonneville) initiated research to determine the energy savings potential of energy-efficient showerheads, including a two-phase study by Pacific Northwest Laboratory (PNL). The PNL study focused on 154 homes monitored with end-use metering equipment. In the first phase of the study, PNL recruited participants from the homes, installed energy efficient showerheads, and collected occupant and site characteristics data. The second phase of the study is an analysis of the end-use load data to estimate energy use and savings from showerheads over a two-year period. This report presents the results from the first phase field study. Program results are based on the number of homes that participated in various aspects of the study. Among the 154 of homes selected for the study, 65% agreed to participate. Eighty-eight percent of these homes actually had their showerheads replaced. After 15 months, 94% of the homes where showerheads were installed still had at least one in place. Measure results are based on the number of showerheads that were installed. The 154 homes contained an estimated 240 showerheads that could have been replaced. Sixty-six percent of these showerheads were actually replaced. If only showers in participant homes are considered, 83% of the showerheads were replaced. Measure persistence at the end of 15 months was 94%. The water flow rate from existing showerheads averaged 3.2 gallons per minute (gpm) at participating sites. Average water pressure for city-supplied water was 66 pounds per square inch (psi). Water pressure at homes on wells was over 40% lower, which reduced savings potential. The energy-efficient showerheads had an average flow rate of 1.8 gpm. Observed water flow reductions of 1.4 gpm were obtained from retrofit of energy-efficient showerheads. In about 20% of the showers, water flows remained constant or actually increased after retrofit of energy-efficient showerheads.

26515 (PNL-SA–22528) **Sequestering carbon dioxide in industrial polymers: Building materials for the 21st century.** Molton, P.M.; Nelson, D.A. Pacific Northwest Lab., Richland, WA (United States). Jun 1993. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93016087. Source: OSTI; NTIS; GPO Dep.

This study was undertaken to determine the possibility of developing beneficial uses for carbon dioxide as a key component for a large-volume building product. Such a use may provide an alternative to storing the gas in oceanic sinks or clathrates as a way to slow the rate of global warming. The authors investigated the concept that carbon dioxide might be used with other chemicals to make carbon-dioxide-based polymers which would be lightweight, strong, and economical alternatives to some types of wood and silica-based building materials. As a construction-grade material, carbon dioxide would be fixed in a solid, useful form where it would not contribute to global warming. With the probable imposition of a fuel carbon tax in industrialized countries, this alternative would allow beneficial use of the carbon dioxide and could remove it from the tax basis if legislation were structured appropriately. Hence, there would be an economic driver towards the use of carbon-dioxide-based polymers which would enhance their future applications. Information was obtained through literature searches and personal contacts on carbon dioxide polymers which showed that the concept (1) is technically feasible, (2) is economically defensible, and (3) has an existing industrial infrastructure which could logically develop it. The technology exists for production of building materials which are strong enough for use by industry and which contain up to 90% by weight of carbon dioxide, both chemically and physically bound. A significant side-benefit of using this material would be that it is self-extinguishing in case of fire. This report is the first stage in the investigation. Further work being proposed will provide details on costs, specific applications and volumes, and potential impacts of this technology.

26516 (PNWD–2131) **Aquifer thermal energy storage at Mid-Island postal facility: Phase 1 final report.** Marseille, T.J.; Armstrong, P.R.; Brown, D.R.; Vail, L.W.; Kannberg, L.D. Pacific Northwest Lab., Richland, WA (United States). May 1993. 156p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93016399. Source: OSTI; NTIS; GPO Dep.

The successful widespread commercialization of aquifer thermal energy storage (ATES) in the United States will depend on how experiences gained from early full-scale projects are used as guides in the design, installation, and operation of future projects. One early system, built in the mid-1980s, is the US Postal Service (USPS) Mid-Island Mail Processing Facility (MPF), in Melville, New York. The heating, ventilation, and air conditioning (HVAC) of the MPF's workroom is provided by an ATES system, which is operated year-round to provide a source for both heating and cooling, in combination with a triethylene glycol (TEG) liquid-desiccant system for humidity control. Because the facility affords a unique opportunity to study this innovative system, the US Department of Energy's (DOE) Pacific Northwest Laboratory (PNL) entered into agreements with the USPS, the US Geological Survey (USGS), and the New York State Energy Research and Development Authority (the Energy Authority) to assess the operation and performance of the system. Two essentially independent questions were to be addressed by the project. The first question was: "How does the MPF ATES/TEG technology compare to conventional technologies?" The second was: "What can be done to make operation of the USPS MPF more economical?" Modelling of the MPF ATES/TEG HVAC system and its loads helped to address both of these questions by showing how much energy is used by the different system components. This report is divided into six sections. Section 1 is an introduction. Section 2 provides system background. Section 3 describes PNL's technical performance assessment of the system. Section 4 discusses the life-cycle cost assessment. An operational assessment of the liquid-desiccant system is discussed in Section 5. Section 6 contains conclusions of this study.

26517 (REFR--93-9) **Stirling cycle heat pumps and refrigerators.** Lundqvist, P.G. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Applied Thermodynamics and Refrigeration. 1993. 300p. Order Number DE93500857. Source: OSTI; NTIS.

This thesis is a theoretical and experimental study of the thermodynamics of the Stirling cycle, operating as a refrigerator or heat pump. The thesis shows that the Stirling cycle is able to compete with the vapour compression cycle, in terms of energy efficiency, at temperature lifts greater than 60 deg C. The benefits and the limitations of the Stirling cycle are thoroughly discussed. Several examples of design changes, and their influence on the performance, are given in the thesis. The optimum design of a refrigerator or heat pump, based on the Stirling cycle, differs substantially from the design of a Stirling engine or a low temperature Stirling refrigerator. One aim of this thesis is to clarify these differences with reference to the variety of losses that occur in real machinery. It is shown, experimentally as well as theoretically, that the temperature lift strongly influence the importance of the design parameters. Special interest has been given to the volume ratio. The most important losses in a low temperature lift Stirling refrigerator or heat pump are: temperature differences in the heat exchangers, and adiabatic cylinder losses (internal cycle temperature differences). It is shown that mechanical friction and unwanted heat conduction set a limit for the design changes necessary to avoid these losses. Any optimization process therefore needs to take these phenomena into consideration at an early stage. A simulation code, Stisim, has been developed, based on a modified adiabatic Stirling cycle analysis with partly decoupled losses. The code is compared with experimentally evaluated data for a modified V160 machine operated as a refrigerator. (120 refs., 136 figs.).

26518 (ETDE-IT--93-165) **Rational energy use in transportation sector: European Communities COST 307 action.** Merzagora, N. ENEA, Rome (Italy). Direzione Studi. Nov 1992. 145p. (In Italian). Order Number DE93799186. Source: OSTI; NTIS (US Sales Only).

COST (European Cooperation in Field of Scientific and Technological Research), a European Communities coordinated research organization founded in 1971, presents this final report on the rational use of energy in the European transportation sector. The report contains analyses comparing Member States' energy conservation policies directed towards energy efficiency improvements in key transportation sector subdivisions - light and heavy road vehicular transport, passenger and freight rail, and air transport. The parameters taken into account in the analyses include statistical data on: traffic (number of passengers, quantity of freight, distances travelled, etc.); relative energy consumption (global and unit values); fuel costs; and type, number, age and maintenance status of vehicles. The analyses also made use of computerized simulations of proposed energy conservation schemes to forecast expected socio-economic impacts, energy savings and reductions in air pollution.

26519 (ORNL/FTR--4242) **Travel to London, England, to attend the sixth international conference on road traffic monitoring and control and to visit traffic control centers in Greater London area to assess their capabilities and operations: Foreign trip report, March 20, 1992--May 1, 1992.** Rathi, A.K. Oak Ridge National Lab., TN (United States). 12 May 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011082. Source: OSTI; NTIS (US Sales Only); GPO Dep.

I attended the Sixth International Conference on Road Traffic Monitoring and Control organized by The Institution of Electrical Engineers (IEE) in London. England. I also visited the traffic control centers in Central and East London and saw a demonstration of AUTOGUIDE, an in-vehicle route guidance system. The AUTOGUIDE demonstration included a drive through Central London with the help of an on-board navigation and route guidance system. Useful information was obtained on the current status of the AUTOGUIDE and similar projects in Europe. Most of the forty-seven (47) papers presented at the conference were of high quality and contained new and innovative approaches to road traffic monitoring and control. Several pavers were of great interest to ongoing work at the Oak Ridge National Laboratory on the Intelligence Vehicle Highway Systems (IVHS) and Chemical Stockpile Emergency Preparedness Program (CSEPP) projects. The papers in the sessions on Urban Networks, Driver Information, and Imaging were of particular interest. In many instances, the material presented clearly indicated the advanced state of technology applications in traffic management in Europe (e.g., the Dutch Fog-Detection Experiments and the M25 Motorway control system). There were over a dozen exhibitors in the conference. Noteworthy among the exhibits were the TrafficMaster system, a weigh-in-motion system, and the ELTRACS system. The TrafficMaster system is a portable traffic information system which covers an area of approximately 35 miles radius from Central London.

26520 (ORNL/TM--12361) **1990 Nationwide Truck Activity and Commodity Survey selected tabulations: Summary report.** Oak Ridge National Lab., TN (United States). Jun 1993. 124p. Sponsored by Department of Transportation, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93015360. Source: OSTI; NTIS; GPO Dep.

The Nationwide Truck Activity and Commodity Survey (NTACS) provides detailed activity data for a sample of trucks covered in the 1987 Truck Inventory and Use Survey (TIUS) for days selected at random over a 12-month period ending in 1990. The NTACS was conducted by the US Bureau of the Census for the US Department of Transportation (DOT). A Public Use File for the NTACS was developed by Oak Ridge National Laboratory (ORNL) under a reimbursable agreement with the DOT. The content of the Public Use File and the detailed design of the NTACS are described in the ORNL Report "Technical Documentation for the 1990 Nationwide Truck Activity and Commodity Survey Public Use File". (1992). ORNL Technical Report No. TM-12188, Oak Ridge National Laboratory, Oak Ridge, TN 37831. The main purpose of this summary report is to provide selected tables based on the public use file.

3203 Industrial and Agricultural Processes

26521 (ANL/EAIS/TM--96) **Modeling plant-level industrial energy demand with the Manufacturing Energy Consumption Survey (MECS) database and the Longitudinal Research Database (LRD).** Boyd, G.A.; Neifer, M.J.; Ross, M.H. Argonne National Lab., IL (United States). Aug 1992. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93017524. Source: OSTI; NTIS; GPO Dep.

This report discusses Phase 1 of a project to help the US Department of Energy determine the applicability of the Manufacturing Energy Consumption Survey (MECS) database and the Longitudinal Research Database (LRD) for industrial modeling and analysis. Research was conducted at the US Bureau of the Census; disclosure of the MECS/LRD data used as a basis for this report was subject to the Bureau's confidentiality restriction. The project is designed to examine the plant-level energy behavior of energy-intensive industries. In Phase 1, six industries at the four-digit standard industrial classification (SIC) level were studied. The utility of analyzing four-digit SIC samples at the plant level is mixed, but the plant-level structure of the MECS/LRD makes analyzing samples disaggregated below the four-digit level feasible, particularly when the MECS/LRD data are combined with trade association or other external data. When external data are used, the validity of using value of shipments as a measure of output for analyzing energy use can also be examined. Phase 1 results indicate that technical efficiency and the distribution of energy intensities vary significantly at the plant level. They also show that the six industries exhibit monopsony-like behavior; that is, energy prices vary significantly at the plant level, with lower prices being correlated with a higher level of energy consumption. Finally, they show to what degree selected energy-intensive products are manufactured outside their primary industry.

26522 (EGG–2698) **Research and engineering assessment of biological solubilization of phosphate.** Rogers, R.D.; McIlwain, M.E.; Losinski, S.J.; Taylor, D.D. EG and G Idaho, Inc., Idaho Falls, ID (United States). Mar 1993. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93010368. Source: OSTI; NTIS; GPO Dep.

This research and engineering assessment examined a microbial phosphate solubilization process as a method of recovering phosphate from phosphorus containing ore compared to the existing wet acid and electric arc methods. A total of 860 microbial isolates, collected from a range of natural environments were tested for their ability to solubilize phosphate from rock phosphate. A bacterium (Pseudomonas cepacia) was selected for extensive characterization and evaluation of the mechanism of phosphate solubilization and of process engineering parameters necessary to recover phosphate from rock phosphate. These studies found that concentration of hydrogen ion and production of organic acids arising from oxidation of the carbon source facilitated microbial solubilization of both pure chemical insoluble phosphate compounds and phosphate rock. Genetic studies found that phosphate solubilization was linked to an enzyme system (glucose dehydrogenase). Process-related studies found that a critical solids density of 1% by weight (ore to liquid) was necessary for optimal solubilization. An engineering analysis evaluated the cost and energy requirements for a 2 million ton per year sized plant, whose size was selected to be comparable to existing wet acid plants.

26523 (ETDE-IT–93-155) **Energy efficiency technologies and experiences in industrial plant.** Di Bartolomeo, M.; Palazzi, G. ENEA, Casaccia (Italy). Area Energetica. 1992. 23p. (CONF-9210372–2: Workshop on the rational use of energy, Budapest (Hungary), 27-29 Oct 1992). Order Number DE93799183. Source: OSTI; NTIS (US Sales Only).

The ENEA (Italian Agency for Energy, New Technologies and the Environment) Energy Plant Department supports the introduction of advanced technology in industrial processes to improve the rational use of energy and decrease consumption. This paper reports on some recent Energy Plant Department research project results. The projects included: digital image processing techniques in the forging process (a system, coupling a telecamera with microprocessor for image processing was developed for remote measuring of the forged piece coming from the furnace); a spool piece for multiphase flow-rate measurement based on two gamma densitometers, a Venturi tube, a capacitive probe and two differential pressure gauges (the goal is to monitor the three phases (oil-water-gas) flow in the submarine pipeline); a feed-water pump cavitation control system using noise analysis of pressure fluctuations and heated thermocouples (the system is now working in an Italian thermoelectrical power plant); an automated visual inspection system for electric railroad cables to improve safety and reliability of railway transportation service (the system couples CCD cameras with a computer, and is able to measure the residual cable thickness with an accuracy of 0.25 mm with a 36 km/h inspection speed); new hydraulic mini-turbine test to characterize the velocity field in the machine with a laser doppler anemometer; tests in a large scale facility to increase turbine efficiency; tests in a high temperature facility to improve components and materials working at temperatures of more than 1500 degrees C.

26524 (ETDE-IT–93-158) **Cementation of toxis sludges: Italian experience.** Balzamo, S.; De Angelis, G.; De Poli, F. ENEA, Casaccia (Italy). 1992. 21p. (CONF-921020–4: Cement industry solutions to waste management, Calgary (Canada), 7-9 Oct 1992). Order Number DE93799184. Source: OSTI; NTIS (US Sales Only).

Research work is being undertaken at ENEA (Italian Agency for Energy, New Technologies and the Environment) laboratories about the stabilization by Portland cement of different types of sludges, like those arising from electroplating, tanning and pottery manufactures. Each waste material was tested in order to evaluate the environmental impact and predict long-term behaviour. An interesting experience concerning the re-use of products from the stabilization of polluted sludges dredged from a harbour in the North of Italy, is described. Tests concerning the characterization of such products proved successful. In particular the retention capacity of toxic elements was demonstrated. A detailed proposal regarding the acceptance criteria of sludge materials is also presented.

26525 (ETDE/JP-mf–93798907) **Prospect on new energies.: Effective energy utilization.** Institute of Applied Energy, Tokyo (Japan). Mar 1991. 25p. (In Japanese). Order Number DE93798907. Source: OSTI; NTIS; Available from The Institute of Applied Energy, 14-2, Nishishinbashi 1-chome, Minato-ku, Tokyo, Japan.

This paper reports surveys on effective energy utilization carried out by the General Energy Engineering Research Institute of Japan. According to an estimate on supply of oil substituting energies as determined in a Japanese Government Cabinet meeting in 1990, the total supply amount in 2000 would reach 594 million kl (1 liter equals 9,250 kcal), and the final energy consumption would amount to 391 million kl (converted to crude oil). An effective utilization rate of the energies supplied to the entire society is about one third, which has fallen instead of increase in power demand. Waste heats must be utilized sufficiently. Energy consumption in major countries remains at an annual average rate of 1% of their GNP. Improvement for energy utilization rate must be addressed to a more economically optimum point. That the energy price has been stabilized now, conservation of resources and energies must be stressed again urgently to deal with the simultaneous occurrence of the global warming problem. It is doubtful whether the idea of carbon taxation or carbon dioxide taxation applied to the manufacturing industries would make a turning point to energy conservation, or how much effect the taxation system could bring about in the transportation and consumer sectors. 6 refs., 16 figs., 6 tabs.

26526 (ETSU-B–1305-P1) **An analysis of landfill charges in the UK.** Burnett, J.S. Aspinwall and Co., Shrewsbury (United Kingdom). 1992. 71p. Order Number DE93504800. Source: OSTI; NTIS (US Sales Only).

This analysis of landfill charges is one component of a broader consultancy for the Energy Technology Support Unit (ETSU) studying the strategic options for energy from waste schemes within the private waste industry. This survey is of landfill gate charges only, and excludes the cost of collection and transport to the site. A telephone survey of public authorities and private waste disposal companies in each county in England and Wales was carried out between January and September 1991. Public authority charges were obtained from the waste disposal authorities, and private waste contractor charges were obtained by contacting companies listed in the National Waste Disposal Contractors Membership Directory and the Aspinwall SITEFILE Digest (1991). (author)

26527 (KCL-RAINA–6) **Energy efficient paper production.** Komppa, A. (ed.). Finnish Pulp and Paper Research Inst., Espoo (Finland). 1991. 184p. (In Finnish). (CONF-9111321–: RAINA-seminar, Espoo (Finland), 14 Nov 1991). Order Number DE93500421. Source: OSTI; NTIS.

RAINA Research Programme.

The goal of the five-year RAINA-program is to optimize the utilization of energy in the papermaking process. So far ten research projects and four joint development projects have been financed by the program. The ongoing projects presented at the third RAINA-seminar on 14 November 1991 were the following ones: The effect of vacuum on dewatering and the structure of paper at the wire section. Determination of the vacuum requirements of the paper machine. Improving heat and power economy of a paper machine equipped with turbine-driven vacuum system. Optimization of the low pressure level of the press suction roll at the paper machine. Development of a dryer section simulation model meeting the requirements of the paper machine operating personnel. Optimization of press drying from the energy and quality point of view. Measurement of paper quality properties. Development of low- consistency beating of chemical pulps. Energy efficient use of IR dryers. This publication also contains a list of the publications within the program.

26528 (KCP–613-5138) **Pollution prevention through total quality.** Stoltz, D.L.; Byrant, M.G.; Eggers, D.M.; Gough, R.W.; Schlosberg, W.H. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. May 1993. 16p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-930483–7: 9. waste minimization and pollution prevention conference, San Francisco, CA (United States), 13-15 Apr 1993). Order Number DE93013814. Source: OSTI; NTIS; GPO Dep.

Application of Total Quality to AlliedSignal Inc., Kansas City Division's (KCD) Pollution Prevention Program has created a dynamic and focused effort to significantly reduce process inefficiencies and waste generation. KCD is demonstrating TQ's usefulness by empowering associates and obtaining their buy-in and ownership of pollution prevention principles. Specific pollution prevention working groups include: establishing a comprehensive recycling process; (2) capitalizing on Environmentally Conscious Manufacturing (ECM) expertise; and (3) encouraging the internal implementation of ECM. TQ produces the performance results that promote and sustain plant-wide pollution prevention goals and activities. KCD uses AlliedSignall's nine step "Process Improvement Problem/Solving Model" (Appendix A). Although this program only formally began within the past year, many of the tools have been used over the last eight years to achieve pollution prevention objectives. This paper focuses on the new attitude and gives examples of how each of the nine steps is being used in the KCD Pollution Prevention Program. This paper describe s each step of the process and provides specific pollution prevention examples.

26529 (KCP–613-5172) **Rapid Intelligent Inspection Process Definition for dimensional measurement in advanced manufacturing.** Brown, C.W. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Mar 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-9303165–1: Advanced technology program proposal meeting, Arlington, TX (United States), 19 Mar 1993). Order Number DE93011271. Source: OSTI; NTIS; GPO Dep.

The Rapid Intelligent Inspection Process Definition (RIIPD) project is an industry-led effort to advance computer integrated manufacturing (CIM) systems for the creation and modification of inspection process definitions. The RIIPD project will define, design, develop, and demonstrate an automated tool (i.e., software) to generate inspection process plans and coordinate measuring machine (CMM) inspection programs, as well as produce support information for the dimensional measurement of piece parts. The goal of this project is to make the inspection and part verification function, specifically CMM measurements, a more effective production support tool by reducing inspection process definition flowtime, creating consistent and standard inspections, increasing confidence of measurement results, and capturing inspection expertise. This objective is accomplished through importing STEP geometry definitions, applying solid modeling, incorporating explicit tolerance representations, establishing dimensional inspection,techniques, embedding artificial intelligence techniques, and adhering to the Dimensional Measuring Interface Standard (DMIS) national standard.

26530 (LA–12532-MS) **Metal-ion recycle technology for metal electroplating waste waters.** Sauer, N.N.; Smith, B.F. Los Alamos National Lab., NM (United States). Jun 1993. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93016006. Source: OSTI; NTIS; GPO Dep.

As a result of a collaboration with Boeing Aerospace, the authors have begun a program to identify suitable treatments or to develop new treatments for electroplating baths. The target baths are mixed-metal or alloy baths that are being integrated into the Boeing electroplating complex. These baths, which are designed to replace highly toxic chromium and cadmium baths, contain mixtures of two metals, either nickel-tungsten, nickel-zinc, or zinc-tin. This report reviews the literature and details currently available on emerging technologies that could affect recovery of metals from electroplating baths under development by Boeing Aerospace. This literature survey summarizes technologies relevant to the recovery of metals from electroplating processes. The authors expanded the scope to investigate single metal ion recovery technologies that could be applied to metal ion recovery from alloy baths. This review clearly showed that the electroplating industry has traditionally relied on precipitation and more recently on electrowinning as its waste treatment methods. Despite the almost ubiquitous use of precipitation to remove contaminant metal ions from waste electroplating baths and rinse waters, this technology is clearly no longer feasible for the electroplating industry for several reasons. First, disposal of unstabilized sludge is no longer allowed by law. Second, these methods are no longer adequate as metal-removal techniques because they cannot meet stringent new metal discharge limits. Third, precious resources are being wasted or discarded because these methods do not readily permit recovery of the target metal ions. As a result, emerging technologies for metal recovery are beginning to see application to electroplating waste recycle. This report summarizes current research in these areas. Included are descriptions of various membrane technologies, such as reverse osmosis and ultrafiltration, ion exchange and chelating polymer technology, and electrodialysis.

26531 (NEI-DK–1218) **Cooling needs and energy consumption in compressor-cooled seed potatoes.** Rasmussen, R. Bioteknologisk Inst., Kolding (Denmark). 1992. 30 p.p. (In Danish). Order Number DE93500331. Source: OSTI; NTIS.

The report shows that conditions such as storage volume, insulation, placing and defrosting methods have a significant influence on cooling needs and energy consumption related to the storage of seed potatoes. An average consumption of 30-40 kWh per ton per season is realistic where optimum storage conditions are achieved. With unsatisfactory conditions energy consumption would be twice as great. Energy consumption becomes much higher if storage facilities are poorly constructed or controlled, or if operational periods are too long. The background for these conclusions is described in some detail and illustrated with tables. (AB).

26532 (ORNL/FTR–4112) **Travel to The Netherlands for activities of the International Energy Agency's Heat Pump Centre: Foreign trip report, October 11–19, 1991.** Broders, M.A. Oak Ridge National Lab., TN (United States). 23 Oct 1991. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011085. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler, serving as Delegate from the United States Heat Pump Centre National Team, participated in the activities of the third IEA-HPC Working Team meeting. Highlights of this meeting included development of a 1992 IEA-HPC work plan, review and discussion of 1991 IEA-HPC activities and accomplishments, and introduction of the Italian National Team. The traveler, also serving as Delegate from the United States CADDET National Team, participated in the activities of the annual IEA-CADDET Working Team meeting. Highlights of this meeting included a workshop that introduced the most recent version of the CADDET Register and its database management system, a status review of recent and current IEA-CADDET activities, and discussion of future plans for CADDET Analyses, Newsletter Topics, Brochure production, and Register input.

26533 (ORNL/Sub–86-22044/2) **Development of a zirconia-mullite based ceramic for recuperator applications: DOE/ORNL Ceramic Technology Project.** Gonzalez, J.M. (GTE Products Corp., Towanda, PA (United States)). Oak Ridge National Lab., TN (United States); GTE Products Corp., Towanda, PA (United States). Dec 1992. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013451. Source: OSTI; NTIS; GPO Dep.

GTE Products Corporation developed a compact ceramic high temperature recuperator for recovering heat from relatively clean exhaust gases at temperatures up to 2500F. The DOE program allowed GTE to improve the technical and economic characteristics of the recuperator and stimulate industrial acceptance of the recuperator as an energy-saving technology. From January 1981 to December 1984, 561 recuperators were installed by GTE on new or retrofitted furnaces. With over 1200 units sold commercially between 1981 and 1990, GTE has documented the effect (long and short term) of corrosive attack from alkalies and lead. One objective of this contract was to develop Z-1000 a zirconia-mullite mixed oxide ceramic for use in ceramic recuperator applications susceptible to corrosion. To first and second pass of the ceramic recuperator would utilize the current cordierite-mixed-oxide ceramic. A Z-1000 matrix element would be used in the preheated air side's third pass

(exhaust inlet). Thermal stresses on Z-1000 cross flow module could be minimized by selecting appropriate heat transfer surface areas for each pass. A large surface area for first and second pass (cordierite section) could provide for sufficient heat transfer for 50% effectiveness. A surface area that generates minimal heat transfer in the third pass (Z-1000) section is envisioned. Heat transferred in this section reduces the differential temperature across the matrix and the thermal stresses. Hence, thermal shock resistance of the material in the third pass becomes less critical; however, its corrosion resistance must be sufficient to withstand corrosive attack. This modular design could utilize a field repairable, disposable matrix. This report is concerned with process technology development for fabricating such a matrix, and a series of corrosion tests that established the potential corrosion resistance of the Z-1000 ceramic.

26534 Conversion of hazardous materials using supercritical water oxidation. Rofer, C.K.; Buelow, S.J.; Dyer, R.B.; Wander, J.D. To Dept. of Energy. 29 Mar 1991. USA patent application 7-677,738. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93008232. Source: OSTI; NTIS; GPO Dep.

A process for destruction of hazardous materials in a medium of supercritical water without the addition of an oxidant material. The hazardous material is converted to simple compounds which are relatively benign or easily treatable to yield materials which can be discharged into the environment. Treatment agents may be added to the reactants in order to bind certain materials, such as chlorine, in the form of salts or to otherwise facilitate the destruction reactions.

26535 (PNL–8483) **Impact evaluation of an Energy $avings Plan project at Holnam Incorporated.** Brown, D.R.; Spanner, G.E. Pacific Northwest Lab., Richland, WA (United States). May 1993. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93014863. Source: OSTI; NTIS; GPO Dep.

This impact evaluation of four energy conservation measures (ECMs) that were recently installed at Holnam Incorporated (Holnam) was conducted for the Bonneville Power Administration (Bonneville) as part of an evaluation of its Energy $avings Plan (E$P) Program. The Program makes acquisition payments to firms that install energy conservation measures in their industrial processes. The objective of this impact evaluation was to assess how much electrical energy is being saved at Holnam as a result of the E$P and to determine how much the savings cost Bonneville and the region. The impact of the ECMs was evaluated with a combination of engineering analysis, financial analysis, site visit and interview, and review of previous program submittals (Holnam's Proposals and Completion Reports). The four ECMs were all electronic power control devices that replaced less efficient technologies for controlling power to the kiln drive motors, cooler grate drive motors, cooler fan motors, and kiln stack gas precipitators. Energy savings from this project are expected to be 1,782,000 kWh/yr or 0.20 average megawatts. On a unit production basis, this project will save 3.4 kWh/ton of cement, based on Holnam's projected average annual future production rate. The four ECMs cost a total of $248,232 to install, and Holnam received payment of $115,615 from Bonneville for the acquisition of energy savings. Program administrative costs incurred by Bonneville, Pacific Northwest Laboratory (PNL), and Seattle City Light (SCL) were estimated to be $29,362. The real levelized cost (1992 $) of these energy savings to Bonneville will be 6.2 mills/kWh over the project's expected 15-year life, and the real levelized cost (1992 $) to the region will be 14.1 mills/kWh. Based on expected ECM installation costs and energy savings benefits alone, none of the four ECMs would have been implemented by Holnam without the E$P acquisition payment.

26536 (PNL–8484) **Impact evaluation of an adjustable speed drive installed at Ball-InCon Glass Packaging Corporation under the Energy $avings Plan.** Spanner, G.E.; Sullivan, G.P. Pacific Northwest Lab., Richland, WA (United States). May 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93015684. Source: OSTI; NTIS; GPO Dep.

This impact evaluation of an adjustable speed drive that was recently installed at Ball-InCon Glass Packaging Corporation (Ball-InCon) was conducted for the Bonneville Power Administration (Bonneville) as part of an evaluation of its Energy $avings Plan (E$P) Program. The Program makes acquisition payments to firms that install energy conservation projects in their industrial processes. The objective of this impact evaluation was to assess how much electrical energy is being saved at Ball-InCon as a result of the E$P and to determine how much the savings cost Bonneville and the region. The impact of the project was evaluated with a combination of engineering analysis, financial analysis, interviews, and submittal reviews (Ball-InCon's Abstract, Proposal, and Completion Report). The project consists of switching from inlet guide vanes to adjustable frequency drives for 10 motors that provide cooling air to glass container molds. Based on this impact evaluation, energy savings from this project are expected to be 1,711,500 kWh/yr, or about 0.20 average megawatts. On a per-ton basis, this project will save approximately 7.8 kWh/ton of glass produced. The project cost $182,834 to install, and Ball-InCon received payment of $95,581 from Bonneville for the acquisition of energy savings. The real levelized cost of these energy savings to Bonneville is 5.2 mills/kWh over the projects's assumed 15-year life, and the levelized cost to the region is 10.7 mills/kWh in 1992 dollars, not including transmission and distribution effects. This project would not have been implemented without the acquisition payment from Bonneville, so all of the energy savings can be attributed to the E$P.

26537 (PNL-SA–22461) **Advanced recycling and research complexes: A second strategic use for installations on the base closure list.** Walter, D.W.; Kuusinen, T.L.; Beck, J.E. Pacific Northwest Lab., Richland, WA (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930570–3: 2. annual Federal environmental restoration conference and exhibition, Washington, DC (United States), 25-27 May 1993). Order Number DE93015674. Source: OSTI; NTIS; INIS; GPO Dep.

Obstacles currently facing the solid waste recycling industry are often related to a lack of public and investor confidence, issues of profitability and liability, and insufficient consumer identification with products made from recycled materials. Resolution of these issues may not be possible without major changes in the way the solid waste recycling business is structured. At the same time, we are faced with opportunities which will not likely recur in our lifetimes: access to educated, well trained work forces; and large tracts of land that are contiguous with metropolitan areas and are developed for heavy industry and transportation. Military installations are being converted to civilian use just in time to serve as important a role in our national resource conservation policy. The future of recycling in North America converges with the future of selected bases on the closure list and takes the form of converting these bases into Advanced Recycling and Research Complexes. The premise is simple: use these strategically-located facilities as industrial parks where a broad range of secondary wastes are separated, refined, or converted and made into new products on site. The wastes would include municipal solid waste (MSW), demolition waste, landscape trimmings, used tires, scrap metal, agricultural waste, food processing waste, and other non-hazardous materials. The park would consist of separation and conversion facilities, research and product standards laboratories, and industries that convert the materials into products and fuels. Energy conversion systems using some waste streams as fuel could be located at the park to supplement energy demands of the industrial operations. The strategic co-location of the resource providers and user industries would minimize transportation costs.

26538 (SAND–93-8235) **Process Waste Assessment, Mechanics Shop.** Phillips, N.M. Sandia National Labs., Livermore, CA (United States). May 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DR00789. Order Number DE93016048. Source: OSTI; NTIS; GPO Dep.

This Process Waste Assessment was conducted to evaluate hazardous wastes generated in the Mechanics Shop. The Mechanics Shop maintains and repairs motorized vehicles and equipment on the SNL/California site, to include motorized carts, backhoes, street sweepers, trash truck, portable emergency generators, trencher,

portable crane, and man lifts. The major hazardous waste streams routinely generated by the Mechanics Shop are used oil, spent off filters, oily rags, and spent batteries. The used off and spent off filters make up a significant portion of the overall hazardous waste stream. Waste oil and spent batteries are sent off-site for recycling. The rags and spent on filters are not recycled. They are disposed of as hazardous waste. Mechanics Shop personnel continuously look for opportunities to minimize hazardous wastes.

26539 (TVA-Bull-Y-229) **Environmental realities in the 90's: Proceedings.** Tennessee Valley Authority, Muscle Shoals, AL (United States). [1993]. 186p. Sponsored by Tennessee Valley Authority, Knoxville, TN (United States). (CONF-9208220--: Environmental realities in the the '90s: TVA's agricultural/environmental conference, St. Louis, MO (United States), 26 Aug 1992). Order Number DE93014193. Source: OSTI; NTIS.

This report is a compilation of proceedings of the TVA's Agricultural/Environmental Conference held in St. Louis, Missouri August 26–28, 1992. Topics discussed include environmental concerns, agriculture, and various legislation and regulations.

26540 (TVA-Circ.–Z-325) **Utilization of by-product ammonium sulfate.** Boles, J.L. Tennessee Valley Authority, Muscle Shoals, AL (United States). [1992]. 16p. Sponsored by Tennessee Valley Authority, Knoxville, TN (United States). (CONF-9210352–1: Annual meeting of the fertilizer industry round table, Baltimore, MD (United States), 26-28 Oct 1992). Order Number DE93014146. Source: OSTI; NTIS.

Sulfur is generally referred to as a secondary plant nutrients but it actually ranks in importance with nitrogen and phosphorous in protein synthesis. It is also an integral part of vitamins and enzymes essential to life. Soils in many areas of the world today are deficient in sulfur and soil sulfur reserves are being rapidly depleted. To address growing agronomic needs for sulfur, TVA's National Fertilizer and Environmental Research Center (NFERC) has been committed to development of technologies to produce low-cost sulfur-containing fertilizers since the mid 1970's. In the late 1970's and early 1980's, NFERC developed and demonstrated a 29-0-0-5S urea-ammonium sulfate (UAS) suspension. In 1984, NFERC developed and later patented a new family of nitrogen-sulfur (NS) suspensions to replace the earlier UAS suspension with more versatile, better quality products made by a simpler, more economical process. NFERC's current endeavors involve development of technologies for successful utilization of low-quality, by-product ammonium sulfate (AS) in the fertilizer industry, which is the subject of this paper. NFERC's current focus on utilization of by-product AS centers around the economic and environmental aspects of these technologies as the primary rationale for development, since the needs for sulfur in soils is now generally well known and sulfur application is common and now charged for in many areas.

26541 (WHC-SA–1904) **Recycling and surplus chemical programs.** Harper, T.J. Westinghouse Hanford Co., Richland, WA (United States). May 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930483–11: 9. waste minimization and pollution prevention conference, San Francisco, CA (United States), 13-15 Apr 1993). Order Number DE93016477. Source: OSTI; NTIS; INIS; GPO Dep.

In 1988, 45 years of defense production came to a close at the US Department of Energy (DOE) Hanford Site. The mission of the Hanford Site was formally changed to environmental restoration and remediation. Westinghouse Hanford Company (WHC) is the management and operations (M&O) contractor leading the cleanup. Within the framework of future Site cleanup, Hanford recycling and surplus chemical programs are making a viable contribution today to waste minimization, diversion of materials from the waste stream, and setting a standard for future operations. This paper focuses on two successful efforts: paper recycling and surplus chemical sales.

26542 (WINCO–11914) **Implementation of the hazardous debris rule.** Sailer, J.E. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). 5 Jan 1993. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. (CONF-9202180–1: Environmental regulations course for Federal Facilities and Government contractors, Idaho Falls, ID (United States), 8-10 Feb 1992). Order Number DE93015660. Source: OSTI; NTIS; INIS; GPO Dep.

Hazardous debris includes objects contaminated with hazardous waste. Examples of debris include tree stumps, timbers, boulders, tanks, piping, crushed drums, personal protective clothing, etc. Most of the hazardous debris encountered comes from Superfund sites and other facility remediation, although generators and treaters of hazardous waste also generate hazardous debris. Major problems associated with disposal of debris includes: Inappropriateness of many waste treatments to debris; Difficulties in obtaining representative samples; Costs associated with applying waste specific treatments to debris; Subtitle C landfill space was being used for many low hazard debris types. These factors brought about the need for debris treatment technologies and regulations that addressed these issues. The goal of such regulation was to provide treatment to destroy or remove the contamination if possible and, if this is achieved, to dispose of the cleaned debris as a nonhazardous waste. EPA has accomplished this goal through promulgation of the Hazardous Debris Rule, August 18, 1992.

26543 (CRIE-T–91085) **Investigation on load prediction method for domestic customer.** Asari, M.; Yoshimitsu, T.; Hashimoto, E. Central Research Inst. of Electric Power Industry, Komae, Tokyo (Japan). Energy and Environment Lab. Jun 1992. 35p. (In Japanese). Order Number DE93798904. Source: OSTI; NTIS; Available from Central Research Inst. of Electric Power Industry, 1-6-1, Ote-machi, Chiyoda-ku, Tokyo, Japan.

Levelling of power load should be promoted by grasping various patterns of power demand such as domestic use and industrial use power. An operation plan is first made for heat storage equipment/electric batteries installed at general household for load levelling, and a basic logic of the load prediction method indispensable for daily operation is clarified. Each household has its own pattern of operation of each electric appliance. When heat storage equipment/electric batteries are not used, power load which can be shifted to the midnight time zone without giving unpleasantness to users is 3-5%, but cost merits of the time-of-day power rates are very small. The most effective method for short-term (one-hour) prediction is an adaptive time-series model which renews prediction parameters one by one by using gaps between measured values in the past and predicted values. For prediction of next day' load curve, proposed is a neural network adaption model, which is higher in accuracy and flexibility than other models and therefore promising. 21 figs., 4 tabs.

26544 (DOE/FTR–93011812) **Evaluation of the integrated municipal solid waste management systems extant in Japan, with special emphasis on the effectiveness of recycling activities: Foreign trip report, October 10–24, 1992.** Cohen, A.S. (CSI Resource Systems, Inc., Boston, MA (United States)); Abert, J. National Renewable Energy Lab., Golden, CO (United States). 18 Nov 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93011812. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Meetings were held with national government officials to discuss the legislative and regulatory structure governing municipal solid waste management in Japan. Additional meetings were held with local officials to learn how these policies are actually implemented. Tours of waste-to-energy, materials-recovery, and materials-processing facilities provided added insights into the actual implementation activities. Finally, meetings were held with officials from various associations and consultants to assess the true level and types of recycling occurring in Japan. Reports and data were obtained that will support the findings and conclusions that will be documented in the final report being prepared by CSI on solid waste management practices in Japan.

26545 (ETDE/JP-mf–93798681, pp. 54-59) **Process of dioxin generation and its preventive mechanisms.** Kato, T. (Yokohama National University, Yokohama (Japan)). 20 Jan 1993. 94p. (In Japanese). In *Symposium on global environmental conservation*

and air pollution prevention technology. Order Number DE93798681. Source: OSTI; NTIS (US Sales Only).

Based on the fact that dioxin containing substances is not generated in gaseous phase in incineration furnaces at refuse incineration plants, but in ash in dust collector EP with controllable fashions, this paper describes its generation process and its preventive measures. An incineration furnace makes oxidizing reaction to progress at a temperature as high as 700°C, but causes no chlorinating reaction to occur. In contrast, an electric dust collector operates at 300°C, where chlorinating reaction progresses efficiently to produce dioxin and other organic chlorinated compounds. Among various factors in the system, correlation with temperature is decisively high, with chlorination of unburned organic components rising sharply from 200°C and reaching the maximum level at 300°C. Therefore, a first preventive measure should be to improve dust collectors to be usable at lower temperatures. Secondly, dechlorination of EP ash by means of heating it to higher than 400°C. A third measure should include measurement of chlorobenzenes which correlate with dioxin, to simplify overall measurement systems and establish monitoring systems. 5 figs., 1 tab.

26546 (ETDE/JP-mf–93798681, pp. 60-65) **Technologies to treat refuse incineration exhaust gases.: Trends in NOx, HCl and mercury treating technologies.** Sato, T. (NKK Corp., Tokyo (Japan)). 20 Jan 1993. 94p. (In Japanese). In *Symposium on global environmental conservation and air pollution prevention technology.* Order Number DE93798681. Source: OSTI; NTIS (US Sales Only).

The environment around wastes treatment is changing largely as a result of increase in amount of refuse generated and the strengthened treatment regulations. This paper describes trends in treatment technologies to cope with these changes. The 'Guideline to preventing dioxin (DXN) generation' published in the end of 1990 has created efforts to lower the dust collector inlet temperature below 200°C and to convert conventional electric dust collectors to filtering dust collectors. Attention is drawn on improvements in combustion control for NOx emission, wider use of dry methods for HCl and SOx, and chelate rinsing of harmful gases from mercury. New technologies may include a neutralizing removal process that produces chemically active species in exhaust gases by irradiating electron beams to turn SOx and NOx into sulfuric acid and nitric acid, use of denitrification BF loaded with denitrifying catalytic components, a system spraying activated coal powder into exhaust gases to adsorb mercury and DXN, and a process to arrest mercury using a heat resistant chelating agent. 1 fig., 2 tabs.

26547 (ETSU-B–00337) **Some observations on municipal solid waste management in Japan.** Patel, N.M. (AEA Environment and Energy, Harwell (United Kingdom)); Edgcumbe, D. AEA Environment and Energy, Harwell (United Kingdom). 1992. 36p. Order Number DE93504809. Source: OSTI; NTIS (US Sales Only).

Japan's policy on Municipal Waste Management is dictated, essentially, by an acute lack of landfill capacity and, more recently, by heightened environmental concerns. Having, in the fifties and sixties, embarked on a major programme of incinerator construction, Japan has continued to rely on this technology to underpin the waste management function. Currently about 1900 incinerators operate nationwide treating about 75% of the annual municipal waste arisings. The target for incineration is 80%, so the programme of renewal of existing facilities and construction of new plant continues unabated. The increasing affluence of Japanese society over the last two decades has been reflected in the composition of the waste that is produced; essentially seeing an increase in paper and plastic content and a decrease in putrescible matter. To overcome this a source segregation system was introduced to classify the waste stream into three categories; combustible, non-combustible (to include the problematic plastic component) and bulky items. (author)

26548 (KTM/E-B–144) **Energy balance of waste management.** Ranne, A.; Virtanen, Y.; Maekelae, K. Ministry of Trade and Industry, Helsinki (Finland). Energy Dept. 1993. 84p. (In Finnish). Project KTM-272/881/92. Order Number DE93500408. Source: OSTI; NTIS.

The specific energy content of municipal solid wastes is about 27 MJ/kg, where the energy content is defined as the sum of the energy used in manufacturing of materials and the heat value of materials. The heat value of municipal wastes suitable for incineration is about 13 MJ/kg. The energy content of landfill waste in whole Finland is 74000 TJ annually, which means about 6 per cent of the total energy used in the country. The transport energy in the form of liquid fuels used in the waste management is 0,2 - 0,3 MJ per waste kilogram, when the final treatment is landfilling. There are some possibilities to recover energy included in municipal waste: to collect biogas generated in landfills, to incinerate refuse, and to recycle materials. Biogas could be collected to useful energy is about 4300 TJ annually in the entire country and 850 TJ in the Metropolitan area. These values are about 15 per cent of the heat energy that can be recovered in incineration of refuse. The use of primary energy sources would reduce about 11 000 TJ, if the refuse in Metropolitan area were Incinerated. The recycling of materials offers benefits from the viewpoint of primary energy needed and environmental emissions generated. The current recycling of waste paper of the Metropolitan area reduces the use of primary energy sources 9000 TJ annually as compared to landfilling as the other alterative. The recycling of waste glass from glass packaging used in the Metropolitan area brings about an energy conservation of 20 TJ yearly. Recycling of some other materials ie. aluminium, polyethylene and steelplate, are estimated to be beneficial from the viewpoint of energy economy.

26549 (NEI-DK–1184) **The consequences for water purifying plants of using smooth water in district heating transmission systems.** Energiministeriets Energiforskningsprogram. Fjernvarme og produktion af el og varme. Hammer, F.; Soerensen, M.; Wieck-Hansen, K. Bruun og Soerensen Energiteknik A/S, Aarhus (Denmark); Faelleskemikerne (Denmark). Jan 1993. 84p. (In Danish). Contract ENS-1323/90-0011. Order Number DE93500138. Source: OSTI; NTIS.

EFP-90.

The purpose was to establish the consequences to water purification plants in district heating transmission networks of using a friction- reducing, tenside-based additive. Possible solutions of solving any problems in this respect were to be found. Experiments were carried out with a mechanical filter and an ion exchanger plant. It was found that the efficiency of the filter in the mechanical filtration was reduced. This was due to the changes in the shape, size and surface properties of the iron particles due to the addition of the tenside. These changes would not necessarily lead to problems in the system. The iron particles will probably be circulated with the district heating water, so will not precipitate or cause corrosion. The tenside concentration was not reduced as a result of the filtration and no decomposition of the tenside occurs. It is concluded that ion exchanger resins are unfit for district heating systems using smooth water. Such filters absorb almost all the tenside, and fouling of the resins would occur in the short term. Discharge from the regeneration of the ions exchanger resins is also a problem. But an ion exchanger plant will only be necessary in a district heating plant for the initial three years of operation. After this phase the addition of tenside could take place. Plants using desalinated water conditioned with ammonia where there is no ion exchanger plant at the water/steam side need very careful monitoring for leaks. (AB).

EFP-90.

A survey was made of the sizes of the flats in Copenhagen, Denmark which were expected to be retrofitted with supply of heat from a cogeneration plant. The design principles for two types of heating system comprising a two string connection and indirect connection are described. A number of proposals for types of system, including pipe layout, which could be used are explained and relevant prices are given. Most of the flats are fairly small, and here a traditional system with a common boiler in the cellar would be the cheapest and most flexible, it was found. In the case of smaller numbers of larger flats where individual control of heating is wished

for, a decentral system was found to be more appropriate. Here there can be more flexibility in relation to times of payment. (AB)

26551 (NEI-DK–1190) **Study on identification of guideline projects for the sustainable development of the district heating sector. Bulgaria. Vol 1: Final report.** Danish Energy Group, Silkeborg (Denmark); Bruun og Soerensen Energiteknik A/S, Aarhus (Denmark); Birch og Krogboe A/S, Virum (Denmark). Feb 1993. 150p. Contract IMOe-584. Order Number DE93500118. Source: OSTI; NTIS.

The Bulgarian district heating system was developed under a planned economy, that is now gradually changing to a market economy, at the same time as Bulgaria is in a serious energy crisis. The project's purpose therefore, is to identify projects in the Bulgarian district heating sector for the World Bank, the European Investment Bank, and the European Bank for Reconstruction and Development, that can minimise energy consumption and reduce environmental problems within the Bulgarian district heating sector. The report is divided into two volumes. The first includes "State-of-the-art" for the entire energy production, distribution, consumption and energy prices as well as eighteen project proposals including amongst other - (a) identification of defects in the district heating network, (b) improvement of maintenance organisations, (c) metering and regulating projects, (d) district heating legislation under market conditions and (e) utilisation of geothermal resources in the district heating sector. The second volume includes all relevant data and statistical information within the district heating sector in Bulgaria divided into regions, and cities, respectively over and under 50,000 inhabitants. The project is carried out in close cooperation with the Bulgarian authorities and district heating associations. (au).

26553 (NEI-DK–1196) **District heating master plan study and assessment. Debrecen and Szazhalombatta: Executive summary.** Danish Energy Consultants, Glostrup (Denmark). May 1993. 12p. Contract ENS-2124/93-0001. Order Number DE93500109. Source: OSTI; NTIS.

The report summarizes the findings and conclusions of a technical assessment and evaluation of the existing district heating systems in Szazhalombatta and Debrecen, Hungary, based on the evaluation of information and data given at meetings with the Hungarian electricity board and other relevant authorities. The main issues were to prepare estimates of the future heat demand and to calculate the economic consequences of improvements of the district heating systems. It was recommended to invest in cogeneration units. Economical and environmental aspects were taken into consideration. It is suggested that it would be advisable to undertake, at an energy policy level, an increase in prices of energy over a span of years to the world market level and to establish a tariff and payment system that encourages energy savings. The recommendations in the case of each town are discussed given in detail. (AB).

26554 (ORNL/CON–364) **Electric-utility DSM-program costs and effects, 1991 to 2001.** Hirst, E. Oak Ridge National Lab., TN (United States). May 1993. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93016238. Source: OSTI; NTIS; GPO Dep.

For the past three years (1989, 1990, and 1991), all US electric utilities that sell more than 120 GWh/year have been required to report to the Energy Information Administration data on their demand-side management (DSM) programs. These data provide a rich and uniquely comprehensive picture of electric-utility DSM programs in the United States. Altogether, 890 utilities (of about 3250 in the United States) ran DSM programs in 1991; of these, 439 sold more than 120 GWh and reported details on their DSM programs. These 439 utilities represent more than 80% of total US electricity sales and revenues. Altogether, these utilities spent almost $1.8 billion on DSM programs in 1991, equal to 1.0% of total utility revenues that year. In return for these (and prior-year) expenditures, utility DSM programs cut potential peak demand by 26,700 MW (4.8% of the national total) and cut annual electricity use by 23,300 GWh (0.9% of the national total). These 1991 numbers represent substantial increases over the 1989 and 1990 numbers on utility DSM programs. Specifically, utility DSM expenditures doubled, energy savings increased by almost 50%, and demand reductions increased by one-third between 1989 and 1991. Utilities differed enormously in their DSM-program expenditures and effects. Almost 12% of the reporting utilities spent more than 2% of total revenues on DSM programs in 1991, while almost 60% spent less than 0.5% of revenues on DSM. Utility estimates of future DSM-program expenditures and benefits show continuing growth. By the year 2001, US utilities expect to spend 1.2% of revenues on DSM and to cut demand by 8.8% and annual sales by 2.7%. Here, too, expectations vary by region. Utilities in the West and Northwest plan to spend more than 2% of revenues on DSM that year, while utilities in the Mid-Atlantic, Midwest, Southwest, Central, and North Central regions plan to spend less than 1% of revenues on DSM.

26555 (SAND–92-2903C) **Neural network hardware and software solutions for sorting of waste plastics for recycling.** Stanton, S.L.; Alam, M.K.; Hebner, G.A. Sandia National Labs., Albuquerque, NM (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9305187–1: Ideas in science and electronics, Albuquerque, NM (United States), 11 May 1993). Order Number DE93012850. Source: OSTI; NTIS; GPO Dep.

While plastic recycling efforts have expanded during the past several years, the cost of recovering plastics is still a major impediment for recyclers. Several factors contribute to the prohibitive cost of recycled resins, including the present low marketability of products made with mixed recycled materials, and costs of collecting, sorting and reprocessing plastic materials. A method for automatic sorting of post-consumer plastics into pure polymer streams is needed to overcome the inaccuracies and low product throughput of the currently used method of hand sorting of waste plastics for recycling. The Society of Plastics has designated seven categories as recyclable: Polyethylene terephthalate (PET); High Density Polyethylene (HDPE); Polyvinyl Chloride (PVC); Low Density Polyethylene (LDPE); Polypropylene (PP); Polystyrene (PS); and Other (mixtures, layered items, etc.). With these categories in mind, a system for sorting of waste plastics using near-infrared reflectance spectra and a backpropagation neural network classifier has been developed. A solution has been demonstrated in the laboratory using a high resolution, and relatively slow instrument. A faster instrument is being developed at this time. Neural network hardware options have been evaluated for use in a real-time industrial system. In the lab, a Fourier transform Near Infrared (FT-NIR) scanning spectrometer was used to gather reflectance data from various locations on samples of actual waste plastics. Neural networks were trained off-line with this data using the NeuralWorks Professional II Plus software package on a SparcStation 2. One of the successfully trained networks was used to compare the neural

accelerator hardware options available. The results of running this "worst case" network on the neural network hardware will be presented. The AT&T ANNA chip and the Intel 80170NX chip development system were used to determine the ease of implementation and accuracies for this network.

26556 (UCRL-JC–109347) **Electrical energy metering use at a large research facility.** Falke, S.S. Lawrence Livermore National Lab., CA (United States). Jan 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9203258–1: National Electrical Testing Association meeting, Charleston, SC (United States), 19 Mar 1992). Order Number DE93013046. Source: OSTI; NTIS; GPO Dep.

A brief history of electric energy metering at a large research laboratory is presented. Limited orientation on metering of power and energy quantities derived from single dimension magnitudes is introduced. Operation and application of electromechanical watthour demand, solid state single function transducers, analog multifunction, and digital multifunction discussed. Applications for interdepartmental revenue transfer based on energy and power flow, load profiling, system planning, and use as a troubleshooting tool are described. The material is presented in a perspective for persons familiar with protective relaying components, but lacking similar experience in energy metering.

26557 (ETDE-IT–93-191) **Data analysis, diagnostics, monitoring and control systems to support plant efficiency and rational use of energy in industrial plant.** Di Bartolomeo, M.; Federico, A.G. ENEA, Casaccia (Italy). Area Energetica. 1992. 14p. (CONF-9210372–3: Workshop on the rational use of energy, Budapest (Hungary), 27-29 Oct 1992). Order Number DE93799201. Source: OSTI; NTIS (US Sales Only).

The paper is a departmental review of the methods and the technologies adopted by the Energy Plants Dpt. of ENEA (Italian Committee for the New Technologies, Energy and Environment), a research group of 180 technicians devoted to the study, analysis and transfer to industry and end users of that part of technological innovation that plays a role in the optimization of the production processes, mainly with reference to energy saving and process optimization. The original orientation of the unit, towards the improvement of the efficiency, control and intrinsic safety of nuclear and conventional energy production moratorium plants, was deeply changed after the Italian nuclear program towards energy saving and quality control in industrial processes. New methods were requested and new criteria of technology diffusion were developed for the new goals. This paper accounts for some significant projects involving: applications in the energy plants area; innovations introduced in some reference production sectors such as metal and materials production, components manufacturing, textiles, etc.; the role of the product quality control, design and production methods validation and of components certification; applications in the transportation area, with special reference to the energy environmental control of urban traffic; the role of the automation technologies in the diffusion of the energy saving; the role of the early diagnosis and non-destructive testing in process management.

33 ADVANCED PROPULSION SYSTEMS

3301 Internal Combustion Engines

26558 (DTH-LET-RE–93-4) **The use of straw-derived gas as fuel in gas motors.** Kofoed, E.; Christensen, O.; Henriksen, U. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Lab. for Energiteknik. [1993]. 18p. (In Danish). Order Number DE93500188. Source: OSTI; NTIS.

When gas derived from straw is used as fuel in gas engines, back-firing occurs under some operational conditions. Based on a survey of literature on the use of hydrogen as fuel in internal combustion engines, where this phenomenon is shown to be well-known, the conclusion is drawn that the hydrogen content of the straw-derived gas is a significant cause of the back-firing. Another cause could be the presence of carbon particles in the combustion chamber. Several methods that work against these negative conditions are briefly described. (AB) (34 refs.).

3303 Electric-Powered Systems

26559 (ANL/MCT/CP–78162) **Controls of maglev suspension systems.** Cai, Y.; Zhu, S.; Chen, S.S.; Rote, D.M. Argonne National Lab., IL (United States). [1993]. 43p. Sponsored by Department of Defense, Washington, DC (United States); Department of Transportation, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930702–41: Pressure vessels and piping conference, Denver, CO (United States), 25-29 Jul 1993). Order Number DE93015540. Source: OSTI; NTIS; GPO Dep.

This study investigates alternative control designs of maglev vehicle suspension systems. Active and semi-active control law designs are introduced into primary and secondary suspensions of maglev vehicles. A one-dimensional vehicle with two degrees of freedom, to simulate the German Transrapid Maglev System, is used for suspension control designs. The transient and frequency responses of suspension systems and PSDs of vehicle accelerations are calculated to evaluate different control designs. The results show that active and semi-active control designs indeed improve the response of vehicle and provide an acceptable ride comfort for maglev systems.

26560 (DOE/CE–0395) **Utility emissions associated with electric and hybrid vehicle (EHV) charging.** USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). Electric and Hybrid Propulsion Div. Apr 1993. 128p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93013734. Source: OSTI; NTIS; INIS; GPO Dep.

This project is a joint effort between the US Department of Energy (DOE) and the Electric Power Research Institute (EPRI) to conduct a comprehensive, in-depth assessment of the emission impacts of electric and hybrid vehicles (EHVs). The study determines local and regional emission impacts under a variety of scenarios, covering both conservative and optimistic assumptions about vehicle efficiency, power plant efficiency, and other factors. In all scenarios, EHV use significantly reduces urban emissions of CO, VOC, and TSP. Changes in NO_x and CO_2 emissions are very sensitive to average or marginal power plant emissions and vehicle efficiency assumptions. NO_x and CO_2 emissions changes vary dramatically by region. Certain combinations of EHV and CV scenarios and regions result in significant reductions, while other combinations result in significant increases. Careful use of these results is advised. In all scenarios, SO_2 increases with EHV use although the amount is small-less than 1% of total utility emissions even vath the deployment of 12 million EHVS. But because of emission cap provisions of the Clean Air Act Amendments of 1990, national SO_2 totals will not be allowed to increase. Thus, utilities will have to apply more stringent measures to combat increased SO_2 emissions due to the increased use of electric vehicles.

26561 (ETDE/JP-mf–93798909) **Prospect on new energies.: Electric vehicles.** Institute of Applied Energy, Tokyo (Japan). Mar 1992. 31p. (In Japanese). Order Number DE93798909. Source: OSTI; NTIS; Available from The Institute of Applied Energy, 14-2, Nishishinbashi 1-chome, Minato-ku, Tokyo, Japan.

This paper reports surveys on electric vehicles carried out by the General Energy Engineering Research Institute of Japan. Electric vehicles have not evolved because of having been incapable of sufficient performance to be competitive with gasoline fueled cars. Global environmental problems having become conspicuous, attentions have been drawn again to electric vehicles. The present flash point is in the central Los Angeles area in Southern California with very heavy air pollution, where automobile makers and distributors in that state were obligated to sell electric vehicles at a certain rate after 1998. Electric vehicles with the currently available performance have no chance of success. The vehicles have a number of

problems including development of batteries, and their future is uncertain. Further promotion of their use requires strongly social consensus, assistance for technical development, and economic subsidiary measures. It may safely be said that practicable electric vehicles are the most influential theme for solving drastically the problem of automotive exhaust emission. Nothing can, however, guarantee that the Californian requirement would be complied with as being called for. Works on a long-term basis is desirable. 12 refs., 6 figs., 7 tabs.

3307 Emission Control

26562 (UCRL-JC–112689-Rev.1) **Application of non-thermal plasmas to pollution control: Revision 1.** Penetrante, B.M.; Vogtlin, G.E.; Bardsley, J.N.; Vitello, P.A.; Wallman, P.H. Lawrence Livermore National Lab., CA (United States). Jun 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930256–1-Rev.1: 2. international plasma symposium on world progress in plasma applications, Palo Alto, CA (United States), 9-11 Feb 1993). Order Number DE93016432. Source: OSTI; NTIS; INIS; GPO Dep.

Non-thermal plasma techniques can be used to destroy many types of hazardous molecules. They are particularly efficient when the toxic materials are present in very small concentrations. This paper discusses three particular applications of non-thermal plasmas: (1) decomposition of hydrogen sulfide (H_2S), (2) removal of trichloroethylene (TCE), and (3) removal of nitrogen oxides (NO_x). Emphasis is placed on the energy cost for implementing the decomposition or removal of these pollutants. Some of the factors affecting the energy cost are discussed. The authors discuss in detail their work at LLNL on pulsed plasma processing for the treatment of NO_x in diesel engine exhaust. The results suggest that their plasma reactor can remove up to 70% of NO with relatively high initial concentrations (up to 500 ppM) at a power consumption cost of 2.5% for an engine with an output of 14 kW and an exhaust gas flow rate of 1,200 liters per minute.

26563 (INIS-mf–12758, pp. 634-638) **Nuclear reactors and disarmament.** Almagro, J.C. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Procesos Quimicos); Estrada Oyuela, M.E.; Garcia Moritan, R. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

From a brief analysis of the perspectives of nuclear weapons arsenals reduction, a rational use of the energetic potential of the ogives and the authentic destruction of its warlike power is proposed. The fissionable material conversion contained in the nuclear fuel ogives for peaceful uses should be part of the disarmament agreements. This paper pretends to give an approximate idea on the resources re assignation implicancies. (Author).

26564 (SAIC–93015937) **The economics of proliferation and counterproliferation: Final report.** Murray, B.L.; Hallenbeck, R.A.; Gill, J.M. Science Applications International Corp., McLean, VA (United States). 17 Jun 1993. 51p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States); Arms Control and Disarmament Agency, Washington, DC (United States). (CONF-9306192–Exec.Summ.: Seminar on economics of proliferation and counterproliferation, McLean, VA (United States), 2 Jun 1993). Order Number DE93015937. Source: OSTI; NTIS; INIS; GPO Dep.

On June 2, 1993, the fourth meeting of the seminar series on "Proliferation of Ballistic Missiles and Weapons of Mass Destruction and Implications for Regional Stability" was held at SAIC in McLean, Virginia. This series is sponsored by the Arms Control and Disarmament Agency and is cosponsored by the Ballistic Missile Defense Organization, the Defense Nuclear Agency, the Department of Energy, and the Office of the Secretary of Defense for International Security Policy. The June seminar, "The Economics of Proliferation and Counterproliferation," discussed how economic issues and interests affect proliferation judgments. Seminar participants also examined three economic tools for advancing counterproliferation objectives: Economic Development Assistance, Export Controls, and Economic "Burdensharing" and Conversion Assistance.

26565 (UCRL-JC–113281) **Managing nuclear weapons in the United States.** Miller, G. Lawrence Livermore National Lab., CA (United States). 16 Mar 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9211112–1: Conference on managing nuclear weapons in a changing world, Livermore, CA (United States), 17-18 Nov 1992). Order Number DE93017171. Source: OSTI; NTIS; GPO Dep.

This report discusses the management and security of nuclear weapons in the post-cold war United States. The definition of what constitutes security is clearly changing in the US. It is now a much more integrated view that includes defense and the economy. The author tries to bring some semblance of order to these themes in this brief adaptation of a presentation.

26566 (WINCO–11907) **Noble gas, a potential nuclear proliferation indicator.** Chapman, T.C. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). [1993]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. (CONF-930601–21: American Nuclear Society (ANS) annual meeting, San Diego, CA (United States), 20-24 Jun 1993). Order Number DE93014908. Source: OSTI; NTIS; GPO Dep.

In the post cold war era, it appears that nuclear proliferation will be a continuing problem. At least one reliable technique to detect nuclear activities is needed to deter potential proliferators. This paper proposes a candidate technique for detection. Early efforts to measure nuclear fuel performance, resulted in consideration of a variety of potential techniques. In 1965, Maeck proposed determination of nuclear fuel burnup based on the ratio of two stable fission product isotopes of the same element. Maeck proposed using three ratios; $^{84}Kr/^{83}Kr$, $^{132}Xe/^{131}Xe$, and $^{144}Nd/^{143}Nd$. More recent work includes useful application of krypton and xenon isotope correlation techniques to safeguards at nuclear fuel reprocessing facilities. The safeguards application requires very precise measurement of the fission product isotopes, detailed fuel exposure history, and knowledge of the neutron spectrum. Meeting all these requirements is extremely, difficult and requires carefully controlled conditions. The most likely scenario for a proliferator to produce nuclear material suitable for weapons applications is reprocessing of reactor fuel to recovery the plutonium. Since useful amounts of plutonium is produced in all uranium fueled reactors, reprocessing the reactor fuel would be much easier and less expensive compared to mining and enriching uranium to weapons grade material. Reprocessing nuclear reactor fuel releases the noble gases, krypton and xenon, from the fuel. Because capture of the noble gases is difficult, expensive, and produces a radiation, the gases will normally be released during reprocessing. These factors provide the basis of this proposed technique of detecting proliferators.

26567 (WINCO–1121) **Technical specifications manual for the MARK-1 pulsed ionizing radiation detection system: Volume 1.** Lawrence, R.S.; Harker, Y.D.; Jones, J.L.; Hoggan, J.M. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). Mar 1993. 214p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. Order Number DE93014825. Source: OSTI; NTIS; INIS; GPO Dep.

The MARK-1 detection system was developed by the Idaho National Engineering Laboratory for the US Department of Energy Office of Arms Control and Nonproliferation. The completely portable system was designed for the detection and analysis of intense photon emissions from pulsed ionizing radiation sources. This manual presents the technical design specifications for the MARK-1 detection system and was written primarily to assist the support or service technician in the service, calibration, and repair of the system. The manual presents the general detection system theory, the MARK-1 component design specifications, the acquisition and control software, the data processing sequence, and the system calibration procedure. A second manual entitled: Volume 2: Operations Manual for the MARK-1 Pulsed Ionizing Radiation Detection System (USDOE Report WINCO-1108, September 1992) provides a general operational description of the MARK-1 detection system. The Operations Manual was written primarily to assist the field operator in system operations and analysis of the data.

26568 (LBL–31572) **A coarsening model for coherent precipitates.** McCormack, M.T. Lawrence Berkeley Lab., CA (United States). Dec 1991. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015182. Source: OSTI; NTIS; GPO Dep.

The morphological evolution of coherent inclusions in elastic media is studied in two-dimensions. The inclusions are simple dilations with isotropic surface energy in a system with homogeneous elastic constants of negative anisotropy. The equilibrium sizes at which a circular inclusion transforms to a rectangle or square, and at which a square splits into a doublet or quartet of separated inclusions are computed analytically. A finite-element model is then constructed to simulate the evolution of an arbitrary distribution of inclusions along the minimum-energy path. In the model, the circle evolves into a square, which splits into a doublet by hollowing from its center, or, if this is forbidden, by drawing in a perturbation on its surface. The sizes at which shapes spontaneously transform are compared to the equilibrium values. Finally, the simulation is used to study the evolution of a random distribution of inclusions. The first metastable state assumed by the distribution depends on the elastic interaction, surface energy and areal fraction of the inclusion phase through a single dimensionless parameter that groups these three effects. Results are compared to prior theoretical and experimental work on coarsening patterns in three dimensions.

26569 (ANL/XFD/CP–79634) **Interfacial structure of lattice mismatched bcc(110)/bcc(110) transition metal superlattices.** Fullerton, E.E. (Argonne National Lab., IL (United States)); Sowers, C.H.; Bader, S.D.; Mini, S.; Bommannavar, A.S.; Ehrlich, S.N. Argonne National Lab., IL (United States). Mar 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930405–18: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93015162. Source: OSTI; NTIS; GPO Dep.

We present structural characterizations of a series of sputtered Fe/Nb and V/Nb superlattices by high-angle x-ray diffraction. Diffraction scans were performed with the scattering vector at various angles (X) with respect to the layers. X=0° diffraction spectra (normal to the layers) were fitted to a general structural model to determine the (110) lattice strains, interfacial disorder and interdiffusion. X>0° spectra probe the lattice strain of the individual layers and the in-plane interfacial coherence. Both systems form incoherent interfaces above a critical modulation wavelength (Λ_C). At Λ_C, the Fe/Nb system undergoes a crystalline-to-amorphous transition while the V/Nb forms in-plane coherent interfaces.

26570 (BNL–48655) **Passive oxide films on well-defined nickel surfaces: An examination of film growth on Ni(100) with ex situ scanning tunneling microscopy.** Vitus, C.M.; Davenport, A.J. Brookhaven National Lab., Upton, NY (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9309150–2: 12. international corrosion congress, Houston, TX (United States), 19-24 Sep 1993). Order Number DE93014056. Source: OSTI; NTIS; GPO Dep.

The surface morphology and atomic structure of air-formed and passive oxide films on a Ni(100) single crystal is presented. The passive oxide film was formed in a 0.15N Na_2SO_4 solution (pH = 2.8) anodized at 0.0 V vs. Hg/Hg_2SO_4 reference.

26571 (BNL–48665) **In situ studies of passive film chemistry using x-ray absorption spectroscopy.** Davenport, A.J. (Brookhaven National Lab., Upton, NY (United States)); Isaacs, H.S.; Bardwell, J.A.; MacDougall, B. Brookhaven National Lab., Upton, NY (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9309150–1: 12. international corrosion congress, Houston, TX (United States), 19-24 Sep 1993). Order Number DE93014023. Source: OSTI; NTIS; GPO Dep.

The passive film on sputter-deposited thin film Fe and Fe-26Cr electrodes has been examined using in situ X-ray Absorption Near Edge Spectroscopy (XANES). During the x-ray spectroscopic measurements, samples were maintained under potentiostatic control in pH 8.4 borate buffer. The passive film on both Fe and Fe-26Cr is formed from the metal without any detectable losses due to dissolution. Cathodic reduction leads to a loss of Fe from the film in both cases, but substantially less Fe is lost in the case of Fe-26Cr. Transpassive dissolution of Cr from Fe-26Cr only occurred on the second potential cycle after the film had been enriched in Cr due to the reductive dissolution of Fe. Simultaneous collection of both the Fe and Cr x-ray absorption edges provides quantitative information on the relative amounts of material lost during passivation and reduction.

26572 (BNL–48706) **Application of in situ scanning x-ray fluorescence to study the concentration of metal ions in simulated pits.** Isaacs, H.S. (Brookhaven National Lab., Upton, NY (United States)); Davenport, A.J.; Jeong-Hwan, Cho; Rivers, M.L.; Sutton, S.R. Brookhaven National Lab., Upton, NY (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9309150–3: 12. international corrosion congress, Houston, TX (United States), 19-24 Sep 1993). Order Number DE93014054. Source: OSTI; NTIS; GPO Dep.

X-ray energy-dispersive spectroscopy has been used to study the compositions of metal ions in solutions developed during localized corrosion. An electrochemical cell was designed to simulate a corrosion pit, maintaining one-dimensional diffusion and fulfilling the requirements for x-ray fluorescence measurements. The working electrode consisted of a dissolving thin foil of Type 304 stainless steel sealed between Mylar sheets through which the x-ray beam passed. Concentration gradients within the artifical pit were quantitatively determined.

26573 (BNL–48707) **Potential transients, transmission and electrochemical corrosion detection.** Isaacs, H.S. (Brookhaven National Lab., Upton, NY (United States)); Cho, Jeong-Hwan. Brookhaven National Lab., Upton, NY (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9309150–4: 12. international corrosion congress, Houston, TX (United States), 19-24 Sep 1993). Order Number DE93014055. Source: OSTI; NTIS; GPO Dep.

The transmission of potential along a passive metal/electrolyte interface is important in open circuit corrosion monitoring when the containment system rather than an insulated metal specimen is monitored. Potential variations have been considered for transitory and sustained corrosion processes. The observed signals are modified and delayed by the passive surface. Using a transmission line as the equivalent circuit of a pipe and incorporating the impedance characteristics of the passive-metal/solution interface, enabled a quantitative analysis of the effectiveness of corrosion monitoring methods to be carried out.

26574 (BNL–48953) **Spin polarized photoemission studies of interfacial and thin film magnetism.** Johnson, P.D.; Brookes, N.B.; Chang, Y.; Garrison, K. Brookhaven National Lab., Upton, NY (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC02-76CH00016. Contract DMR-86-03304. (CONF-930405–13: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93014326. Source: OSTI; NTIS; GPO Dep.

Spin polarized photoemission is used to study the electronic structure of noble metals deposited on ferromagnetic substrates. Studies of Ag deposited on an Fe(001) substrate reveal a series of minority spin interface or quantum well states with binding energies dependent on the thickness of the silver. Similar behavior is observed for Cu films deposited on a fct Co(001) substrate. Tight-binding modeling reproduces many of the observations and shows that hybridization of the sp-bands with the noble metal d-bands cannot be ignored.

26575 (BNL–48954) **Canted magnetic moments at the Gd(0001) surface.** Li Donggi (Syracuse Univ., NY (US). Dept. of Physics); Zhang Jiandi; Dowben, P.A.; Garrison, K.; Johnson, P.D.; Tang, H.; Walker, T.G.; Hopster, H.; Scott, J.C.; Weller, D.; Pappas, D.P. Brookhaven National Lab., Upton, NY (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930405–14: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93014327. Source: OSTI; NTIS; INIS; GPO Dep.

With spin polarized electron spectroscopies, the authors have investigated ordered Gd(0001) films deposited on W(110). The photoemission features of the gadolinium 5d surface state, the 4f levels, and the background exhibit considerable spin polarization along the same direction in the plane of the film, indicative of ferromagnetic coupling between the surface and the bulk. The 4f spin polarized photoemission data provides strong evidence that the surface 4f polarization differs from the bulk 4f polarization for Gd(0001). The temperature dependent measurements with spin polarized secondary electron spectroscopy conclusively establishes that the surface of clean Gd(0001) possesses a perpendicular polarization component which persists to an enhanced surface Curie temperature. Small amounts of contamination at the surface result in the disappearance of the perpendicular component and, therefore, a more perfect ferromagnetic coupling between the surface and the bulk.

26576 (CEA-CONF–11290) **Chemical and electrochemical aspects of the corrosion of stainless steels in the presence of sulphate reducing bacteria.** Feron, D. (CEA Centre de La Hague, 50 - Cherbourg (France)). CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides. 1990. [10p.] (CONF-9010138–: International congress on microbially influenced corrosion, Knoxville, TN (United States), 7-12 Oct 1990). Order Number DE93630437. Source: OSTI; NTIS (US Sales Only); INIS.

The corrosion behaviour of austenitic and ferritic stainless steels (316 L and 430Ti) in the presence of sulfate reducing bacteria, was investigated by several electrochemical techniques which were coupled with corrosion measurements on coupons and chemical analyses. Experiments were performed with 'Desulfovibrio vulgaris' and 'Desulfovibrio gigas' in three growth media containing lactate and sulfate. The decreases in corrosion potentials were correlated to the increase in sulphide content. The polarization curves showed also the major influence of sulphides on the passivity of stainless steels. Electrochemical impedance measurements were used to provide information in understanding the interactions between growth media or bacteria and stainless steels surfaces. The behaviour of the tested stainless steels in these conditions was mainly dependent on sulphide concentrations. (Author). 7 refs., 8 figs., 4 tabs.

26577 (CEA-CONF–11291) **Morphological kinetics and localized corrosion.** Santarini, G. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides. 1992. [14p.] (CONF-9210369–: International Conference on Corrosion, deformation interactions, Fontainebleau (France), 5-7 Oct 1992). Order Number DE93630438. Source: OSTI; NTIS (US Sales Only); INIS.

A phenomenological modeling is proposed for physicochemical systems that evolve by initiation and growth of well distinct defects. It consists in a mathematical treatment of data on the evolution of defect distribution, which leads to the knowledge of evolution parameters ultimately usable for behaviour predictions. A method is given for calculating a validity parameter which quantifies the pertinence of the choice for analytical representations. An example of application to localized corrosion is given with the intergranular stress corrosion cracking of Alloy 600 in high temperature water. (Author). 6 refs.

26578 (CEA-CONF–11292) **Application of electrochemical impedance spectroscopy to monitor seawater fouling on stainless steels and copper alloys.** Feron, D. (CEA Centre de La Hague, 50 - Cherbourg (France)). CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides. 1991. [6p.] (CONF-9109491–: International Symposium on Marine and Microbial Corrosion, Stockholm (Sweden), 30 Sep - 2 oct 1991). Order Number DE93630439. Source: OSTI; NTIS (US Sales Only); INIS.

Electrochemical impedance spectroscopy may be applied to detect and to follow seawater fouling. Experiments have been conducted with natural seawater flowing inside tube-electrodes at temperatures between 30 deg C and 85 deg C. With stainless steel tubes, mineral and organic foulings have been followed; a linear relationship between the dry weight of the organic fouling and its electrical resistance, has been observed. On copper alloy tubes, only mineral deposits have occurred and so have been detected by impedance spectroscopy. (Author). 5 refs., 6 figs.

26579 (CEA-CONF–11300) **Compatibility of austenitic and martensitic steels behaviour in semi-stagnant Pb17Li.** Sannier, J.; Dufrenoy, T.; Flament, T.; Terlain, A. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides. 1991. [12p.] (CONF-911111–: 5. international conference on fusion reactor materials (ICFRM-5), Clearwater, FL (United States), 17-22 Nov 1991). Order Number DE93630440. Source: OSTI; NTIS (US Sales Only); INIS.

Compatibility tests between Pb17Li and 316L austenitic or 1.4914 martensitic steels have been performed with experimental conditions simulating the special features of the water-cooled lithium-lead blanket (low Pb17Li velocity, significant radial thermal gradient and short distances between hot and cold zones). In the 420-475 deg C temperature range, the results show that corrosion kinetics for both 316L and 1.4914 steels are quasi-linear and about 3 times lower compared to turbulent condition. From amount of recovered deposits, the mass transfer of 316L steel at 450 deg C appears to be equivalent to that of 1.1914 steel at 475 deg C. The same relationship was observed in flowing Pb17Li condition.

26580 (CEA-CONF–11301) **Mass transfer of 316L steel in Pb17Li clipper loop after 12000-hour running.** Terlain, A.; Flament, T.; Dufrenoy, T.; Sannier, J. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides. 1991. [10p.] (CONF-911111–: 5. international conference on fusion reactor materials (ICFRM-5), Clearwater, FL (United States), 17-22 Nov 1991). Order Number DE93630441. Source: OSTI; NTIS (US Sales Only); INIS.

An examination of the large 316L CLIPPER loop has been done after 12000 hour running with Pb17Li, the hot part being at 400 deg C and the cold part at 340 deg C. The morphology and the

chemical composition of the ferritic layer formed on the tubes at 400 deg C are the same as already observed but its thickness is less than expected from previous shorter tests. This feature can be explained by a partial scaling of the layer. Deposits are located in the cold part of the main circuit and in the cold trap. Their mean density in these zones is about 0.4 $mg.cm^{-1}$ and increases where hydraulic perturbations take place. Temperature lowering favours the formation of chromium, nickel and manganese compounds to the detriment of iron.

26581 (CEA-CONF–11302) **Compatibility of stainless steels and lithium based ceramics with beryllium.** Flament, T.; Herpin, D.; Feve, L.; Sannier, J. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides. 1991. [14p.] (CONF-911111–: 5. international conference on fusion reactor materials (ICFRM-5), Clearwater, FL (United States), 17-22 Nov 1991). Order Number DE93630442. Source: OSTI; NTIS (US Sales Only); INIS.

Introduction of beryllium as neutron multiplier in ceramic blankets of thermonuclear fusion reactors may give rise to the following compatibility problems: - oxidation of beryllium by ceramics or by water vapour, due to the high stability of beryllium oxide, - interaction of beryllium and structural materials. The present report completes previous results and constitutes a synthesis of our work carried out in the compatibility field: - interaction beryllium/steels: a mathematical expression giving the thickness of the diffusion zone as a function of exposure duration and temperature for 316L and 1.1914 steels is proposed, - oxidation of beryllium in contact with Li_2O is noticeable, this phenomenon being much less pronounced with ternary lithium based ceramics, - the oxidation rate of beryllium in the presence of high water vapour content helium is high above 700 deg C.

26582 (CEA-CONF–11303) **Compatibility behavior of beryllium with $LiAlO_2$ and Li_2ZrO_3 ceramics, with 316L and 1.4914 steels in Sibelius.** Flament, T. (CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides); Roux, N.; Abassin, J.J.; Briec, M.; Cruz, D.; Schuster, I. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides. 1991. [13p.] (CONF-911111–: 5. international conference on fusion reactor materials (ICFRM-5), Clearwater, FL (United States), 17-22 Nov 1991). Order Number DE93630443. Source: OSTI; NTIS (US Sales Only); INIS.

The compatibility under irradiation of beryllium with Li_2O, $LiAlO_2$, Li_4SiO_4 and Li_2ZrO_3 ceramics and with 316L and 1.4914 steels was investigated in SIBELIUS. The irradiation was performed in the SILOE reactor at 550 deg C for 1690 hours in He + 0.1%H_2 purge pas. Examinations of the $LiAlO_2$/Be and Li_2ZrO_3/Be couples show a weak oxidation of beryllium and the presence of cavities near the interface with ceramics. Examinations of the 316L/Be and 1.4914/Be couples show the formation of an oxide layer on all beryllium and steel surfaces suggesting that corrosion arises from a species (most likely T_2O and/or H_2O) present in the environmental atmosphere. Post-irradiation annealing tests of beryllium indicate that the major part of helium is released during irradiation whereas the major part of tritium is released above 700 deg C.

26583 (CEA-CONF–11305) **Determination of the diffusion coefficients of iron and chromium in Pb17Li at 500 deg C.** Simon, N.; Flament, T.; Terlain, A. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides. 1992. [5p.] (CONF-920930–: 17. symposium on fusion technology, Rome (Italy), 14-18 Sep 1992). Order Number DE93630405. Source: OSTI; NTIS (US Sales Only); INIS.

The diffusion of the dissolved metallic species in a liquid metal towards the boundary layer is one of the elementary steps of the overall mass transfer process induced by thermal gradient. This phenomenon is very probably the limiting step in the mass transfer of martensitic Fe-Cr steels in the presence of Pb17Li liquid eutectic alloy. For estimating diffusion flux, the diffusion coefficients of iron and chromium in Pb17Li are needed but are not known. Consequently these data have been determined in CEA laboratory by measuring metal loss of cylindrical specimens after rotation at 500 deg C in Pb17Li for several hours and applying the first Fick diffusion law in the boundary layer whose the thickness has been previously determined by EISENBERG. After a description of the experimental device, the results are presented and discussed.

26584 (CEA-CONF–11311) **Zirconium behaviour in nitric medium.** Mur, P.; Fauvet, P. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides. 1990. [5p.] (In French). (CONF-9010356–: Symposium on Zirconium New Material for the Chemical Industry, Lyon (France), 10-11 Oct 1990). Order Number DE93630444. Source: OSTI; NTIS (US Sales Only); INIS.

Zirconium in nitric solutions exhibits an excellent corrosion resistance in the passive state, and a mediocre corrosion resistance in the unpassive state with risk of stress corrosion cracking. Results of the influence of some parameters (medium, potential, temperature, stress, friction, metallurgical structure and surface state) on zirconium passivation are presented. Zirconium remains passive in a large range of HNO_3 concentration (at least up to 14.4N), in the presence of oxidizing ions (Cr^4, Ce^4), in a spent fuel dissolution solution. Zirconium is depassived by friction at high speed and pressure, by platinum coupling in boiling 14.4N HNO_3 with or without stress, or by imposed deformation speed under high potential. (A.B.). 8 figs., 2 tabs.

26585 (CONF-920673–19) **The effect of irradiation on the mechanical properties of 6061-T651 aluminum.** Alexander, D.J. Oak Ridge National Lab., TN (United States). [1992]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 16. annual symposium of American Society of Testing and Materials (ASTM) on effects of radiation on materials; Denver, CO (United States); 21-25 Jun 1992. Order Number DE93015825. Source: OSTI; NTIS; INIS; GPO Dep.

Critical components of the Advanced Neutron Source (ANS) reactor, to be built at Oak Ridge National Laboratory (ORNL), will be fabricated from 6061-T651 aluminum alloy. This alloy has been selected for its favorable neutronic, thermal, and mechanical properties. The effect of irradiation on the tensile properties and fracture toughness has been studied to allow the lifetime of these components to be estimated. Irradiations were carried out in the High Flux Isotope Reactor at ORNL at a temperature of approximately 95°C to a fluence of approximately 10^{26} m^{-2} (thermal). Testing was conducted from room temperature to 150°C. The yield and ultimate tensile strengths were increased by irradiation, and the total elongation decreased, but the fracture toughness at 26 and 95°C was not degraded by irradiation, and decreased only slightly at 150°C.

26586 (CONF-9208184–2) **Chemical and displacement atomic pair correlations in crystalline solid solutions recovered by anomalous x-ray scattering in Fe-Ni alloys.** Ice, G.E. (Oak Ridge National Lab., TN (United States)); Sparks, C.J.; Shaffer, L.B. Oak Ridge National Lab., TN (United States). [1992]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Anomalous scattering international conference; Malente (Germany); 17-21 Aug 1992. Order Number DE93015906. Source: OSTI; NTIS; GPO Dep.

Short-range pair correlations of atoms in crystalline solid solutions consist of both chemical and displacement correlations. Measurement of these pair correlations is fundamental to understanding the properties of solid solutions. We discuss anomalous scattering techniques which have provided an important advance in our ability to recover these pair correlations and to model the local atomic arrangements in crystalline solid solutions of Fe-Ni alloys.

26587 (CONF-921007–32) **Investigations of low-temperature neutron embrittlement of ferritic steels.** Farrell, K.; Mahmood, S.T.; Stoller, R.E.; Mansur, L.K. Oak Ridge National Lab., TN (United States). [1992]. 28p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From 20. water reactor safety information meeting; Bethesda, MD (United States); 21-23 Oct 1992. Order Number DE93015460. Source: OSTI; NTIS; INIS; GPO Dep.

Investigations were made into reasons for accelerated embrittlement of surveillance specimens of ferritic steels irradiated at 50C at the High Flux Isotope Reactor (HFIR) pressure vessel. Major

suspects for the precocious embrittlement were a highly thermalized neutron spectrum,a low displacement rate, and the impurities boron and copper. None of these were found guilty. A dosimetry measurement shows that the spectrum at a major surveillance site is not thermalized. A new model of matrix hardening due to point defect clusters indicates little effect of displacement rate at low irradiation temperature. Boron levels are measured at 1 wt ppM or less, inadequate for embrittlement. Copper at 0.3 wt % and nickel at 0.7 wt % are shown to promote radiation strengthening in iron binary alloys irradiated at 50 to 60C, but no dependence on copper and nickel was found in steels with 0.05 to 0.22% Cu and 0.07 to 3.3% Ni. It is argued that copper impurity is not responsible for the accelerated embrittlement of the HFIR surveillance specimens. The dosimetry experiment has revealed the possibility that the fast fluence for the surveillance specimens may be underestimated because the stainless steel monitors in the surveillance packages do not record an unexpected component of neutrons in the spectrum at energies just below their measurement thresholds of 2 to 3 MeV.

26588 (CONF-921101–116) **Calculation of the thermopower of Ni-P amorphous alloys.** Swihart, J.C. (Indiana Univ., Bloomington, IN (United States). Dept. of Physics); Yang, H.; Nicholson, D.M.C. Oak Ridge National Lab., TN (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting; Boston, MA (United States); 30 Nov - 5 dec 1992. Order Number DE93012960. Source: OSTI; NTIS; GPO Dep.

We have modeled the Ni-P amorphous alloy system by a set of supercells on which we have carried out calculations of electronic and transport properties. The thermopower is determined by calculating the energy dependence of the dc electrical conductivity from the Kubo formalism. At 15% P we find $-0.015\ \mu V/K^2$ for the thermopower divided by the temperature, while for 25% P the calculated value is $+0.008\ \mu V/K^2$, in reasonable agreement with experiment, particularly with regard to the change of sign with concentration.

26589 (CONF-921101–132) **Dynamical Ising model simulations of nucleation and growth in copper-cobalt alloys.** Cerezo, A. (Oxford Univ. (United Kingdom). Dept. of Materials); Hyde, J.M.; Setna, R.P.; Smith, G.D.W.; Miller, M.K. Oak Ridge National Lab., TN (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Grant: GR/H/38485. From 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting; Boston, MA (United States); 30 Nov - 5 dec 1992. Order Number DE93015336. Source: OSTI; NTIS; GPO Dep.

A simple dynamical Ising model on a fixed lattice with a single bond energy parameter has been used to simulate the kinetics of diffusion during solid-state phase transformations in binary metallic alloys. Results of these simulations are compared with direct real-space measurements of the atomic distributions of elements in alloys, obtained with the position-sensitive atom probe. Despite the simplicity of the model, there is good quantitative agreement between the development of microstructure in the simulation and the nucleation and growth of cobalt-rich precipitates in copper-cobalt alloys.

26590 (CONF-921109–6) **The effect of long-term aging on the impact properties of modified 9Cr-1Mo steel.** Alexander, D.J.; Maziasz, P.J.; Brinkman, C.R. Oak Ridge National Lab., TN (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Fall meeting of the Metallurgical Society and American Institute of Metallurgical and Petroleum Engineers; Chicago, IL (United States); 1-5 Nov 1992. Order Number DE93015453. Source: OSTI; NTIS; GPO Dep.

The Charpy impact and room-temperature tensile properties of two heats of modified 9Cr-1Mo steel have been examined after aging at temperatures from 482 to 704C for times up to 75,000 h. In general, aging at lower temperatures (482, 538, or 593C) resulted in little change in the room-temperature tensile properties, but rapid increases in the transition temperature, with the greatest increase for an aging time of 25,000 h. The upper-shelf energy level decreased, reaching a minimum at 25,000 h, followed by recovery at 50,000-h aging. At higher aging temperatures (649 and 704C) there was little change in the transition temperatures, but significant softening at room temperature, and large increases in the upper-shelf energy.

26591 (CONF-921109–7) **The effect of aging at 343°C on the mechanical properties and microstructure of type 308 stainless steel weldments.** Alexander, D.J.; Alexander, K.B.; Miller, M.K.; Nanstad, R.K. Oak Ridge National Lab., TN (United States). [1992]. 8p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From Fall meeting of the Metallurgical Society and American Institute of Metallurgical and Petroleum Engineers; Chicago, IL (United States); 1-5 Nov 1992. Order Number DE93015454. Source: OSTI; NTIS; INIS; GPO Dep.

The effect of long-term aging at intermediate temperatures on the mechanical properties of stainless steel welds has been studied. Three type 308 multipass shielded metal-arc welds with ferrite levels of 4, 8, and 12% were aged up to 20,000 h at 343C. Tensile tests showed little effect of aging on either the yield or ultimate tensile strengths, but the impact toughness was significantly degraded. The extent of the degradation increased with increasing ferrite content and increasing aging time. Examination of the microstructure with transmission electron microscopy and atom probe field-ion microscopy revealed that the ferrite phase had undergone spinodal decomposition as a result of aging. In addition, G-phase particles were observed at dislocations, and finer G-phase particles were homogeneously distributed throughout the ferrite phase. The changes in the mechanical properties and the fractography are discussed in light of the observed changes in the microstructure.

26592 (CONF-9211110–2) **The influence of thermal aging on the microstructure and fatigue properties of modified 9Cr-1Mo steel.** Gieseke, B.G.; Brinkman, C.R.; Maziasz, P.J. Oak Ridge National Lab., TN (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Microstructure and mechanical properties of aging materials; Detroit, MI (United States); 2-5 Nov 1992. Order Number DE93015489. Source: OSTI; NTIS; INIS; GPO Dep.

Results of elevated-temperature low cycle fatigue and creep-fatigue tests are for one heat of modified 9Cr-1Mo steel in the normalized and tempered condition, after pre-aging 50,000 h at 538 and 593C, and after pre-aging for 75,000 h at 538C. These data show that pre-aging reduces the low cycle fatigue and creep-fatigue lives in comparison to unaged material. The magnitude of these reductions are discussed along with the impact of pre-aging on the creep-fatigue damage diagrams. The effect of environment on creep-fatigue life of unaged modified 9Cr-1Mo steels is also addressed. Transmission electron microscopy explains changes in mechanical properties due to thermal aging. In the unaged alloy, TEM shows that dynamic recovery/recrystallization is occurring after significant strain-induced dislocation hardening around a stationary and stable array of as-tempered carbides during creep-fatigue. In contrast creep-fatigue testing of the pre-aged alloy produced a much coarser cellular subgrain structure and dislocation recovery without recrystallization. Aging causes as-tempered carbide dissolution and/or reprecipitation together with additional precipitation of Laves (Fe_2Mo) phase, which removes some of the precipitate-strengthening effects, and depletes solid-solution hardening effects on the dislocation networks and subgrain boundary structures.

26593 (CONF-9211117–9) **Environmental embrittlement in ordered intermetallic alloys.** Liu, C.T. (Oak Ridge National Lab., TN (United States)); Stoloff, N.S. Oak Ridge National Lab., TN (United States). [1992]. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Minerals, Metals, and Materials Society/American Society for Metals (TMS/ASM) materials week '92; Chicago, IL (United States); 2-5 Nov 1992. Order Number DE93015307. Source: OSTI; NTIS; GPO Dep.

Ordered intermetallics based on aluminides and silicides possess many promising properties for elevated-temperature applications; however, poor fracture resistance and limited fabricability restrict their use as engineering material. Recent studies have shown that

environmental embrittlement is a major cause of low ductility and brittle fracture in many ordered intermetallic alloys. There are two types of environmental embrittlement observed in intermetallic alloys. One is hydrogen-induced embrittlement occurring at ambient temperatures in air. The other is oxygen-induced embrittlement in oxidizing atmospheres at elevated temperatures. In most cases, the embrittlements are due to a dynamic effect involving generation and penetration of embrittling agents (i.e., hydrogen or oxygen) during testing. Diffusion of embrittling agents plays a dominant role in fracture of these intermetallic alloys. This chapter summarizes recent progress in understanding and reducing environmental embrittlement in these alloys.

26594 (CONF-9211205–2) **Recent advances in ordered intermetallics.** Liu, C.T. Oak Ridge National Lab., TN (United States). [1992]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From High-temperature ordered intermetallic alloys V; Boston, MA (United States); 30 Nov - 3 dec 1992. Order Number DE93015308. Source: OSTI; NTIS; GPO Dep.

This paper briefly summarizes recent advances in intermetallic research and development. Ordered intermetallics based on aluminides and silicides possess attractive properties for structural applications at elevated temperatures in hostile environments; however, brittle fracture and poor fracture resistance limit their use as engineering materials in many cases. In recent years, considerable efforts have been devoted to the study of the brittle fracture behavior of intermetallic alloys; as a result, both intrinsic and extrinsic factors governing brittle fracture have been identified. Recent advances in first-principles calculations and atomistic simulations further help us in understanding atomic bonding, dislocation configuration, and alloying effects in intermetallics. The basic understanding has led to the development of nickel, iron, and titanium aluminide alloys with improved mechanical and metallurgical properties for structural use. Industrial interest in ductile intermetallic alloys is high, and several examples of industrial involvement are mentioned.

26595 (CONF-930405–25) **Evolving surface cusps during strained-layer epitaxy.** Jesson, D.E. (Oak Ridge National Lab., TN (United States)); Pennycook, S.J.; Baribeau, J.M.; Houghton, D.C. Oak Ridge National Lab., TN (United States). Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Spring meeting of the Materials Research Society; San Francisco, CA (United States); 12-16 Apr 1993. Order Number DE93015430. Source: OSTI; NTIS; GPO Dep.

We have combined Z-contrast imaging and Ge marker layer experiments to study the evolving surface morphology of Si_xGe_{1-x} alloys grown by molecular beam epitaxy (MBE). Surface cusps are seen to arise as the intersection lines between coherent islands. The potential implications of stress concentrations associated with cusps are considered with a view to strain relaxation in the film via dislocation nucleation.

26596 (CONF-9305135–4) **Effects of alloying and temperature on the high-temperature oxidation of Cr-Cr_2Nb.** Tortorelli, P.F. (Oak Ridge National Lab., TN (United States)); DeVan, J.H.; Carson, L.J. Oak Ridge National Lab., TN (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 7. annual conference on fossil energy materials; Oak Ridge, TN (United States); 11-13 May 1993. Order Number DE93015800. Source: OSTI; NTIS; GPO Dep.

Effects of alloying additions and temperature on isothermal and cyclic oxidation resistance of Cr-Cr_2Nb alloys were examined for air exposures. An isothermal exposure temperature of 1100C led to rapid reaction of binary Cr-12 at.% Nb as manifested a high oxidation rate and nonprotective behavior. Generally parabolic kinetics, complicated by some isothermal scale cracking, were observed at 900–1000C. Scale damage was exacerbated by thermal cycling. The addition of 8 at.% Al to Cr-12 at.% Nb did not effect cyclic oxidation resistance, but there was some evidence that scale adherence on Cr-6 at.% Nb-8 at.% Al was better than that for binary Cr-6 at.% Nb. Alloying additions of Al (up to 18 at.%) or Re (2 at.%) did not improve the isothermal oxidation resistance of Cr-12 at.% Nb. However, the tendency for scale damage during both isothermal and thermal cycling exposures suggests that alloying additions that specifically improve scale plasticity or modify growth stresses could be effective for Cr-Nb alloys. 10 refs, 9 figs, 1 tab.

26597 (CONF-9305135–5) **Environmental effects on iron aluminides.** DeVan, J.H.; Tortorelli, P.F. Oak Ridge National Lab., TN (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 7. annual conference on fossil energy materials; Oak Ridge, TN (United States); 11-13 May 1993. Order Number DE93015820. Source: OSTI; NTIS; GPO Dep.

Corrosion properties of reference Fe_3Al (28 at. % Al)-based compositions containing 2 and 5 at. % Cr were compared in a mixed gas composed of H_2S-H_2-H_2O-Ar and in dehumidified air. The parabolic rate constant at 800C was a factor of 200 higher for the 5% Cr composition. Similar exposure of an alloy containing 16% Al and 5% Cr resulted in significantly higher weight gains than the Fe_3Al – 5% Cr composition. However all the alloys were significantly more resistant to the mixed gas than iron-based alloys with higher chromium and lower aluminum contents. The oxidation rates of the 2 and 5% Cr alloys were comparable in dry air at 800C and were a factor of two lower than the rate of the 2% Cr alloy in the mixed gas. An alloy of Fe with 16% Al, 5% Cr, and 0.1% Zr showed improved cyclic oxidation resistance in air at 900 and 1000C relative to binary alloys of 16 and 20% Al. The extent of oxidation of these 16% Al alloys was comparable to Zr-containing Fe_3Al aluminides (28% Al) that develop adherent scales.

26598 (CONF-930803–13) **Design of a cruciform bend specimen for determination of out-of- plane biaxial tensile stress effects on fracture toughness for shallow cracks.** Bass, B.R.; Bryson, J.W.; Mcafee, W.J.; Pennell, W.E.; Theiss, T.J. Oak Ridge National Lab., TN (United States). [1993]. 12p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From 12. biennial conference for the International Association for Structural Mechanics in Reactor Technology (SMIRT 12); Stuttgart (Germany); 16-26 Aug 1993. Order Number DE93015455. Source: OSTI; NTIS; INIS; GPO Dep.

Pressurized-thermal-shock loading in a reactor pressure vessel produces significant positive out-of-plane stresses along the crack front for both circúmferential and axial cracks. Experimental evidence, while very limited, seems to indicate that a reduction in toughness is associated with out-of-plane biaxial loading when compared with toughness values obtained under uniaxial conditions. A testing program is described that seeks to determine the effects of out-of-plane biaxial tensile loading on fracture toughness of RPV steels. A cruciform bend specimen that meets specified criteria for the testing pregam is analyzed using three-dimensional elastic-plastic finite-element techniques. These analysis results provide the basis for proposed test conditions that are judged likely to produce a biaxial loading effect in the cruciform bend specimen.

26599 (CONF-930997–2) **A reexamination of grain boundary fracture in Ni_3Al: Environmental and alloying effects.** George, E.P. (Oak Ridge National Lab., TN (United States)); Liu, C.T.; Pope, D.P. Oak Ridge National Lab., TN (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC05-84OR21400. Grant: DMR/MRL91-20668. From International symposium on structural intermetallics; Champion, PA (United States); 26-30 Sep 1993. Order Number DE93015431. Source: OSTI; NTIS; GPO Dep.

The intrinsic room-temperature ductility (~23%) of polycrystalline Ni_3Al is considerably higher than previously thought. Environmental embrittlement, caused by moisture in ordinary ambient air, reduces significantly the maximum attainable ductility in air. Microcracks (introduced during processing) can also reduce the maximum attainable ductility in air. A consequence of these extrinsic factors is that polycrystalline Ni_3Al is usually found to be quite brittle in air, and very careful experimental procedures are required if its (higher) intrinsic ductility is to be measured. The addition of B essentially suppresses environmental embrittlement in Ni_3Al, thereby improving ductility. The substitutional elements Zr and Hf also improve ductility, but Ti (which is from the same group in the periodic table) does not. The mechanism by which Zr and Hf improve ductility is not known, but they appear to both alleviate environmental embrittlement and enhance grain-boundary cohesion.

26600 (CONF-930997–3) **Development and commercialization status of Fe_3Al-based intermetallic alloys.** Sikka, V.K.; Viswanathan, S.; McKamey, C.G. Oak Ridge National Lab., TN (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International symposium on structural intermetallics; Champion, PA (United States); 26-30 Sep 1993. Order Number DE93015802. Source: OSTI; NTIS; GPO Dep.

The Fe_3Al-based intermetallic alloys offer unique benefits of excellent oxidation and sulfidation resistance, limited by poor room-temperature (RT) ductility and low high-temperature strength. Recent understanding of environmental effects on RT ductility of these alloys has led to progress toward taking commercial advantage of Fe_3Al-based materials. Cause of low ductility appears to be related to hydrogen formed from reaction with moisture. The environmental effect has been reduced in these intermetallic alloys by two methods. The first deals with producing a more hydrogen-resistant microstructure through thermomechanical processing, and the second dealed with compositional modification. The alloys showing reduced environmental effect have been melted and processed by many different methods. Laboratory and commercial heats have been characterized. Tests have been conducted in both air and controlled environments to quantify environmental effects on these properties. These materials were also tested for aqueous corrosion and resistance to stress corrosion cracking. Oxidation and sulfidation data were generated and effects of minor alloying elements on were also investigated. Several applications have been identified for the newly developed iron aluminides. Commercialization status of these alloys is described.

26601 (DOE/ER/45141–9) **[A microstructural approach to fatigue crack processes in poly crystalline BCC materials]: Progress report.** Gerberich, W.W. Minnesota Univ., Minneapolis, MN (United States). Dept. of Chemical Engineering and Materials Science. [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84ER45141. Order Number DE93016666. Source: OSTI; NTIS; GPO Dep.

Objective was to study fatigue where a combination of low temperature and cyclic loading produced cyclic cleavage in bcc Fe-base systems. Both dislocation dynamics and quasi-statics of crack growth were probed. This document reviews progress over the past 6 years: hydrogen embrittlement and cleavage, computations (stress near crack tip), disiocation emission from grain boundaries, fracture process zones, and understanding brittle fracture at the atomistic/dislocation scales and at the microscopic/macroscopic scale.

26602 (DOE/ER/45315–17) **Boundary stability under nonequilibrium conditions: Progress report.** Michigan Technological Univ., Houghton, MI (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER45315. Order Number DE93016259. Source: OSTI; NTIS; GPO Dep.

Purpose of this work is to study microscopic, nanometer-scale behavior of interfaces under nonequilibrium conditions prevailing during service or materials processing. The need is to study grain boundary and surface/thin film instabilities under applied stress and chemical diffusion. This document is divided into: grain boundaries (stability, dislocations under applied stress, structural stability of grain boundaries during DIGM and under applied stress) and surfaces/thin films (hillock growth on microcrystalline and single crystal surfaces, plate edge instabilities, coherently strained islands). 31 refs.

26603 (DOE/ER/45461–2) **[Fundamental studies of passivity and passivity breakdown].** Macdonald, D.D. Pennsylvania State Univ., University Park, PA (United States). Center for Advanced Materials. [1993]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER45461. Order Number DE93017052. Source: OSTI; NTIS; GPO Dep.

We developed and experimentally tested physical models for growth and breakdown of passive films on metal surfaces. These models are "point defect models," in which the growth and breakdown are described in terms of movement of anion and cation vacancies. The work during the past 5 years resulted in: theory of growth and breakdown of passive films, theory of corrosion-resistant alloys, electronic structure of passive films, and estimation of damage functions for energy systems. Proposals are give for the five ongoing tasks. 10 figs.

26604 (DOE/ER/45461–9) **Critical issues in the use of metals and alloys in sulphur-containing aqueous systems.** Macdonald, D.D. Pennsylvania State Univ., University Park, PA (United States). Center for Advanced Materials. [1992]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER45461. (CONF-9208224–1: 31. annual conference of metallurgists on materials performance, sulphur and energy, Edmonton (Canada), 24-27 Aug 1992). Order Number DE93012924. Source: OSTI; NTIS; GPO Dep.

Sulphur-containing aqueous fluids are amongst the most corrosive environments experienced in industrial and natural systems. The high corrosivity is due principally to the wide range of oxidation states that sulphur may exist in within the thermodynamic stability domain of water, as well as to the high lability of many sulphur species, such as the polythionic acids and polysulfides. Additionally, sulphur, along with arsenic, antimony, and mercury, effectively promotes the entry of hydrogen into metal and alloy matrices, thereby leading to hydrogen damage and hydrogen embrittlement. In this paper, the chemistry of sulphur species in aqueous solutions and of the various iron sulphides is reviewed with emphasis on illustrating the diverse nature of metal/sulphur interactions. Finally, we identify a number of critical issues that need to be resolved to greatly improve our understanding of the chemistry of sulphur-containing systems and to improve our ability to predict the form and extent of corrosion in geochemical and geoenergy systems.

26605 (DOE/ER/45461–10) **Vacancy condensation as the precursor to passivity breakdown.** Macdonald, D.D. Pennsylvania State Univ., University Park, PA (United States). Center for Advanced Materials. [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER45461. (CONF-930998–1: Fall committee week of the National Association of Corrosion Engineers, Houston, TX (United States), 26 Sep - 1 oct 1993). Order Number DE93012925. Source: OSTI; NTIS; GPO Dep.

This paper outlines the events that are envisaged to occur, according to the Point Defect Model (PDM), during "chemically-induced" breakdown of the barrier layer on passivated metals and alloys in aqueous environments. The essential hypothesis of the model is that the local generation of cation vacancies at the barrier layer/environment interface, due to the autocatalytic adsorption of a damaging species such as chloride ion into the oxygen vacancy structure, leads to an enhanced flux of cation vacancies across the film. If the vacancies that arrive at the metal/film interface cannot be annihilated by cation ejection from the metal, the vacancies will condense leading to the local decohesion of the barrier layer from the metal. A combination of film dissolution at the barrier layer/environment interface and residual stresses in the oxide film leads to the physical rupture of the film, marking a passivity breakdown event. The PDM accounts for a variety of empirically-established relationships for the nucleation of pits, including the fact that the breakdown voltage (V_c) and induction time (t_{ind}) are distributed quantities; that $V_c = V_c^\circ$ - blog (a_{Cl^-}), where $b > 2.303RT/F$; and that log (t_{ind})α $1/\Delta V$, where ΔV = V (applied voltage) - V_c. Also, the model has been extended to account for alloying effects and, indeed, new alloys are now being designed on the basis of rules that have been derived from the PDM.

26606 (DOE/ER/45461–22) **Fundamental studies on passivity and passivity breakdown.** Macdonald, D.D.; Urquidi-Macdonald, M. Pennsylvania State Univ., University Park, PA (United States). [1993]. 123p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER45461. (CONF-9306175–1: OPA peer review on electrochemistry and aqueous corrosion of materials: aqueous corrosion emphasis, Washington, DC (United States), 17 Jun 1993). Order Number DE93015501. Source: OSTI; NTIS; GPO Dep.

Using photoelectrochemical impedance and admittance spectroscopies, a fundamental and quantitative understanding of the mechanisms for the growth and breakdown of passive films on metal and alloy surfaces in contact with aqueous environments is

being developed. A point defect model has been extended to explain the breakdown of passive films, leading to pitting and crack growth and thus development of damage due to localized corrosion.

26607 (ETDE-IT–93-185) **Correlation between X-ray diffraction line profile analysis and solid state reactions induced by mechanical alloying of elemental powders.** Guo, W.; Martelli, S.; Magini, M.; Padella, F.; Paradiso, E. ENEA, Casaccia (Italy). Area Energia e Innovazione. 1992. 6p. (CONF-9207207–1: European powder diffraction conference, Enschede (Netherlands), 30 Jul - 1 aug 1992). Order Number DE93799199. Source: OSTI; NTIS (US Sales Only).

Within the framework of research studies on the feasibility of forming amorphous alloys by the mechanical alloying of elemental powders, this paper reports on the application of the Fourier diffraction method of Warren-Averbach (developed to measure external stress-induced strain) to mechanically alloyed $Pd_{80}Si_{20}$ samples which showed a progressive transition from the crystalline to the amorphous state upon ball milling. The Pd reflections presented, during alloying, an increasing broadening, which could not be simply referred to defects introduced by powder cold working. From the logarithm-quotient Warren plot, a function proportional to $L=na_3$ in the physical space could be derived. The measured function of L fulfilled, in the early stages of alloying, the para-crystal concept, suggesting that the mechanically driven diffusion of Si into Pd caused para-crystalline distortion of the host lattice. However, direct connections between lattice distortions and amorphous phase formation could not be established on the basis of the present results.

26608 (INIS-mf–12758, pp. 17-24) **Iron oxides photochemical dissolution.** Blesa, M.A. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Dept. de Quimica de Reactores); Litter, M.I. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

This work was intended to study the light irradiation influence of diverse wave-lengths on iron oxides dissolution in aqueous solutions. The objectives of this work were: the exploration of photochemical processes with the aim of its eventual application in: (a) decontamination and chemical cleaning under special conditions; (b) materials for solar energy conversion. (Author).

26609 (INIS-mf–12758, pp. 245-260) **Zircaloy 4 ingots' industrial fabrication: Actual development state.** Leyt, A. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Procesos Quimicos). Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The technology developed for the industrial fabrication of Zircaloy-4 ingots is presented. According to the results obtained: (a) the homogeneity of the ingots is analyzed, regarding the distribution of components (tin, iron, chromium, oxygen) and Brinell hardness as a function of different types of charge: zirconium sponge-recycling alloy material, sponge of zirconium-alloy; (b) the distribution of the same parameters as a function of production is also analyzed. (Author).

26610 (INIS-mf–13544) **Radiation materials science. V. 5.** Zelenskij, V.F. (ed.). AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. [232p.] (In Russian, English). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

This volume includes the papers of the international conference on radiation materials in Alushta, Ukraine in May 1990. The main topics are: basic research in radiation damage physics, a study of the structural materials for reactor cores; irradiation effect on reactor vessel, fuel, super- and semiconductor materials; investigation damage research methods.

26611 (INIS-mf–13544, pp. 3-10) **Space and time dissipation structures in impurity crystals under irradiation.** Selishchev, P.A. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij); Sugakov, V.I. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

Self-organization of elastically interacting defect density and development of dissipative in space and time concentration structures of proper defects and impurity atoms, temperature of irradiated crystals were investigated. It is shown that at critical conditions of irradiation the stationary and homogeneous defect distribution becomes unstable and a dissipative structure is formed. Crystal properties, form of irradiation and heat removal define its type and parameters. 11 refs.; 3 figs. (J.P.).

26612 (INIS-mf–13544, pp. 11-18) **A model of the effective lossy medium for a binary alloy under irradiation.** Bakai, A.S. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Turkin, A.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

The kinetics of vacancies and interstitials produced by irradiation in a binary alloy with complete is considered. No elastic interaction between point defects and sinks is assumed to exist. At sinks the concentrations of vacancies and interstitials are fixed at their thermal equilibrium values. Despite radiation-induced segregation causing local changes in composition around sinks, all sinks remain unbiased toward absorption of defects of a certain type, i.e. segregation alone does not lead to preferential loss of either vacancies of interstitials at a given sink. The balance equations for the average defect concentrations are derived. It is shown that the solute concentration at a sink does not depend on its geometry. 13 refs.; 1 fig.; 1 tab. (author).

26613 (INIS-mf–13544, pp. 55-62) **The mechanism of cascade vacancy loop nucleation in HCP zirconium.** Kapinos, V.G. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Atomnoj Ehnergii); Osetskij, Yu.N.; Platonov, P.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

A diffusive rearrangement of non-equilibrium depleted zone (DZ) at the thermal stage of cascade development is investigated in Zr using the dynamical computer simulation. At concentrations of vacancies in DZ $C\text{-bar}_v$=10 at.% nucleation of prism loops with the Burgers vectors b=1/3<1120> was predominant. At DZ vacancy concentration $C\text{-bar}_v$=15 at.%, basal loops with Burgers vectors b=1/6<2023> nucleate along with prism ones. It is suggested that nucleation of prism loops in zirconium might be affected by processes related to polymorphic transformation in cascade region. 9 refs.; 2 figs.; 1 tab. (author).

26614 (INIS-mf–13544, pp. 63-69) **Positron spectroscopy of radiation defects of vanadium.** Maev, S.N. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.); Miron, N.F. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

The interstitial impurity atoms effect on the annealing of the neutron irradiation, electron irradiation and deformation induced defects has been investigated for the single crystal vanadium. It was found that the non-annealed single crystal vanadium contains the microvoids. The defects annealing stages in the temperature range 20-560^{0}C were observed for electron irradiated and deformed vanadium. The processes proceeding in those stages are discussed. 11 refs.; 3 figs.; 1 tab. (author).

26615 (INIS-mf–13544, pp. 89-96) **About the role of divacancies and diinterstitials in the theory of homogeneous nucleation of radiation-induced voids in metals.** Bondarenko, A.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.); Chernov, V.M. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

The system of stiff non-linear differential equations describing the kinetics of vacancy voids and interstitial dislocation loops nucleation and growth in pure metal (nickel) is solved with the high mobilities of divacancies and diinterstitials taken into account. The calculated time dependences of void nucleation rate are present and discussed, the dependences of other values calculated are briefly described. It is shown that the account of di-defects mobility results in significant increase of void nucleation rate. However, the rates obtained are not high enough to meet the void concentration usually observed at highest temperatures of void formation. 13 refs.; 1 fig.; 1 tab. (author).

26616 (INIS-mf–13544, pp. 97-103) **About homogeneous nucleation of vacancy voids.** Demin, N.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.). AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

Calculated results on vacancy void nucleation in irradiated metals are presented. The model of homogeneous void nucleation was investigated with preferentially absorb voids interstitials with respect to vacancies. It is shown that the void nucleation rate is much below homogeneous nucleation rate which was calculated in the frame of classical model. The temperature interval of void nucleation was found more narrow that also contradict available results, which were obtained with using the saddle point method. 11 refs.; 3 figs.

26617 (INIS-mf–13544, pp. 81-88) **Radiation effects in thin films on the conducting materials surface.** Suvorov, A.L. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

Transformation of structure, composition and some properties of solid state system thin film (thickness in the range from one to ten atomic layers) massive substrate under the irradiation by low energy gas ions (with energies from several hundreds to ten thousand eV) is considered. Among basis processes, contributing to the evolution of such system the following processes are analyzed: defects formation, atomic (cascadeless) mixing, sputtering and erosion, diffusion. Some data of experimental investigation of these processes by field electron and field ion microscopy methods are given. 20 refs.; 4 figs. (author).

26618 (INIS-mf–13544, pp. 104-111) **Calculation of point defect sink strengths in binary and ternary substitutional alloys.** Pechenkin, V.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.); Epov, G.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

Analytical expressions for the stationary component profiles of binary and ternary substitutional alloys in the vicinity of point defect sinks under irradiation are derived. It is shown, that the slowest component must be segregated at the sinks, but the two other components must migrate away from the sinks in ternary alloys with vacancy mechanism of radiation-induced segregation. The segregation-induced biases of different kinds of sinks are calculated by means of spatial component distributions obtained. 9 refs.; 3 figs.; 1 tab. (author).

26619 (INIS-mf–13544, pp. 112-120) **Theory of the void nucleation in crystals under intensive irradiation.** Dubinko, V.I. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.). AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

Effect of image interaction of voids with point defects on the void nucleation in materials supersaturated with vacancies and interstitials is investigated. Analytical expressions is derived for the stationary nucleation rate in the limit of infinite supersaturation which corresponds to a sufficiently high dose rate (or low temperature) of irradiation. In this limit the nucleation rate is shown to be independent of irradiation conditions and to be determined by the constants of interaction of point defects with voids and dislocations. The theory predicts higher nucleation rates for bcc metals as compared to fcc ones which is in agreement with experimental observations. 10 refs.; 1 fig. (author).

26620 (INIS-mf–13544, pp. 129-133) **Atomic mixing of metals.** Zabolotnyj, V.T. (AN SSSR, Sverdlovsk (Russian Federation). Inst. Ehkologii Rastenij i Zhivotnykh); Ivanov, L.I. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

It is proposed to use the model of dynamic mass transfer for choosing conditions and forecasting the results of ion treatment for producing homogeneous of elements which are non-soluble under equilibrium conditions. 7 refs.; 4 figs. (author).

26621 (INIS-mf–13544, pp. 150-157) **Phase structural changes in nickel alloys in the process of thermal ageing and under irradiation.** Uvarov, N.V. (Vsesoyuznyj Nauchno-Issledovatel'skij Inst. Neorganicheskikh Materialov, Moscow (Russian Federation)); Sokurskij, Yu.N.; Mironova, E.G.; Bryk, V.V. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

Results of the investigation of structure and properties of a number of high-nickel and model alloys in different structural conditions after simulation irradiation by helium, heavy ions and after reactor irradiation by neutrons are presented. 4 refs.; 5 figs.; 2 tabs.

26622 (INIS-mf–13544, pp. 158-165) **Structural state in ion irradiated metal systems.** Khmelevskaya, V.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.); Solov'ev, S.P.; Malynkin, V.G.; Kudrya, E.V. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

Using the methods of structure investigations it was found that irradiation of Fe-Ni, Fe-Cr-Ni, Ni-Cr and Fe-Cr solid solutions initiates transformation to a new phase state which proceeds within some dose, temperature and flux density ranges. This new state is non-equilibrium one because it can be eliminated as a result of subsequent annealing at irradiation or lower temperatures. Specific features of the state permit to treat it as a dissipative structure predicted within the frames of thermodynamics of irreversible processes. 2 refs.; 6 figs. (author).

26623 (INIS-mf–13544, pp. 165-170) **Phase stability of ordered alloys under irradiation.** Bakaj, A.S. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Fateev, M.P. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

A method is proposed to build the effective free energy of the binary ordered alloy under irradiation. A general procedure is developed to construct phase diagrams of irradiated ordered alloys. As an example, the alloy of the Cu_3Au-type is considered. Using the kinetic equation for the long range order and taking into account the vacancy mechanism of ordering, the Lyapunov function, which is an analog of the free energy of the alloy under irradiation, is found in the Bragg-Williams approximation. The developed approach is applied to calculate the phase diagram and the spinodal for the alloy of the Cu_3Au-type. 7 refs.; 2 figs. (author).

26624 (INIS-mf–13544, pp. 179-186) **Stacking fault density as engineering criterion for resistance to radiation swelling of alloys' FCC- and BCC-lattice.** Zheltov, Yu.V. (Opytnoe Konstruktorskoe Byuro Mashinostroeniya, Gor'kij (Russian Federation)); Ageev, V.S.; Kolesnikov, Yu.G. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

The experimental data on influence of Mn, Cr, Ni, P, B, Ce alloying in austenitic and simultaneously Nb, V, B alloying in ferritic steels and also heat treatment on stacking fault density (SFD) are represented. In all cases besides influence of Cr in austenitic steel the increase of SFD is shown. The decrease of radiation swelling of industrial steels at the increase of their SFD, measured by X-rays, was studied. The tendency of increase of relative radiation swelling change at SFD increase at relative fluence rise is verified. It is shown that SFD may be a perspective proximate characteristics of choice of radiation-resistant steel melts within one steel quality. 14 refs.; 4 figs. (author).

26625 (INIS-mf–13544, pp. 195-201) **Study of swelling copper alloys irradiated by heavy Ions.** Barabash, V.P. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (Russian Federation)); Naberenkov, A.V.; Nesterova, E.V.; Rybin, V.V.; Fabritsiev, S.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

Radiation swelling and microstructure changes in prospective copper alloys after ion irradiation were investigated. It was shown that dispersion-consolidated types of alloys are the most prospective materials for energy-stressed elements of thermonuclear reactors from the swelling stability point of view. 14 refs.; 5 figs. (J.P.).

26626 (INIS-mf–13544, pp. 171-178) **Radiation-acoustic studies of materials with non-linear thermoelastic properties.** Uvarov, V.T. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Slezov, V.V.; Popov, G.F.; Kalinichenko, A.I. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

Radiation acoustic methods are used to investigate the dynamics of phase transitions in materials with non-linear thermoelastic properties, including alloys with a shape memory effect, rare-earth metals, high-Tc ceramics, etc. The temperature dependence of the Grueneisen parameter and the elastic modulus of the materials under study are shown to be sensitive to the concentration of the constituents, alloy components and gas saturation. Discussed are possible methods of control of the parameters, absorbed energy field and the phase state of the materials under radiation action of pulsed high-current relativistic electron beams. 5 refs.; 4 figs. (author).

26627 (INIS-mf–13544, pp. 202-209) **Vacancy and impurity complexes in the Ni-Sc system and their influence on the radiation swelling.** Gann, V.V. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Marchenko, I.G.; Neklyudov, I.M.; Petrusenko, Yu.T.; Sleptsov, A.N. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 5.* [232p.] Order Number DE93630453. Source: OSTI; NTIS (US Sales Only); INIS.

Experimental research and mathematic modelling of impurity complexes formation processes and their influence on radiation swelling processes are presented. 19 refs.; 5 figs. (author).

26628 (INIS-mf–13545) **Radiation materials science. V. 6.** Zelenskij, V.F. (ed.). AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. [218p.] (In Russian, English). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

This volume includes the papers of the international conference on radiation materials in Alushta, Ukraine in May 1990. The main topics are: basic research in radiation damage physics, a study of the structural materials for reactor cores; irradiation effect on reactor vessel, fuel, super- and semiconductor materials; investigation damage research methods.

26629 (INIS-mf–13545, pp. 3-11) **The effect of radiation-induced segregation on shape and growth rate of vacancy voids.** Bakaj, A.S. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Borodin, O.V.; Bryk, V.V.; Voevodin, V.N.; Neklyudov, I.M.; Platonov, P.V.; Turkin, A.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

Microstructural changes have been studied in Kh18N10T steel in BOR-60 up to 40 dpa at 580-600^{0}C. It was found out that in the vicinity of the voids associated with G-phase precipitates the composition of steel is practically the same as the average matrix one, whereas the isolated voids are surrounded by Ni and Si enriched zones. The shape and size of a void depend on local composition near it - the mean size of octahedral voids (associated with G-phase) is greater than that of cubic voids. The theoretical model is developed to explain the observed differences between growth rates of isolated and precipitate-attached voids. 10 refs.; 2 figs.; 1 tab. (author).

26630 (INIS-mf–13545, pp. 12-27) **Express-analysis of irradiated steel mechanical properties.** Tsepelev, A.B. (AN SSSR, Moscow (Russian Federation). Inst. Metallurgii); Bystrov, L.N.; Pojmenov, I.L.; Kulikova, O.I. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

A rather high sensibility of the miniature disk bending method which permits to fix small effects connected with saturation of a material with radiation-formed point defects was demonstrated on

example of electron irradiation influence on mechanical properties of austenitic stainless steels. 9 refs.; 7 figs.; 2 tabs. (J.P.).

26631 (INIS-mf–13545, pp. 28-33) **Helium atom doping of molybdenum and its influence on the radiation hardenings.** Vagin, S.P. (AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki); Loktionov, A.A.; Reutov, V.F. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

Experimental results on study of helium concentration influence on degree of molybdenum radiation hardening for various method of cyclotron doping differing in degree and damage character are presented. It is established that accumulation of helium atoms in molybdenum for simultaneous formation of radiation defects caused by low energetic primary-knocked atoms leads to higher degree of hardening than for high energetic ion irradiation. It is shown that with increase of helium atom concentration the degree of radiation hardening for the same level of damage increases. 4 refs.; 3 figs. (author).

26632 (INIS-mf–13545, pp. 34-49) **Influence of helium and hydrogen on the embrittlement of construction materials with fcc- and bcc-lattices.** Rybin, V.V. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Konstrktsionnykh Materialov, S. Peterburg (Russian Federation)); Fabritsiev, S.A.; Zhdan, G.T.; Reutov, V.F. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

An attempt of critical comparative analysis of helium embrittlement (HE) tendencies in austenite alloy with high content of nickel X20H45 (fcc) and ferrite steel X13M1 (bcc) was made. It was shown that a strong influence of the high-temperature deformation velocity on HE in austenite materials exists and a noticeable intensification of HE was detected when the deformation velocity is lowered. Influence of helium on high-temperature mechanical properties of austenite alloy and ferrite steel in general is the same. The discovered effect of HE sharp increase in case of hydrogen adding requires a further study. 13 refs.; 7 figs. (J.P.).

26633 (INIS-mf–13545, pp. 50-53) **Influence of irradiation with 20 MeV hydrogen and helium ions on the structure and properties of construction materials and semi-conductors.** Zabrodin, B.V. (Nauchno-Proizvodstvennoe ob'edinenie "Pozitron", S. Peterburg (Russian Federation)); Kozlovskij, V.V.; Fabritsiev, S.A.; Shustrov, B.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

Processes of gas embrittlement in thermonuclear reactor construction materials induced by protons and alpha-particles as well as processes of semi-conductor materials transmutation (nuclear) doping were investigated. 4 refs.; 1 tab. (J.P.).

26634 (INIS-mf–13545, pp. 54-59) **Helium atoms behaviours in aluminium and its alloys.** Zaritskij, N.S. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij); Karasev, V.S.; Tsybul'ko, Yu.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

The aluminium and its alloys specimens AMg and AMg(Sc) irradiated to the different doses by the low-energy helium ions from the glow discharge plasma at the temperature of $\approx 350^0$C were investigated by the internal friction method, thermodesorption method, optical and transmission electron microscopy method. The dose dependences of the grain boundary maximum height changing were made. The helium binding energy with the grain-boundary traps was calculated. The helium concentration in the samples corresponded to the grain boundaries adsorption saturation and investigated materials inclination to swelling were estimated. 11 refs.; 3 figs.; 1 tab. (author).

26635 (INIS-mf–13545, pp. 60-66) **Anelastic relaxation properties of nickel and 0Cr16Ni11Mo3 steel with rare-earth additions.** Karasev, V.S. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij); Grinik, Eh.U.; Neklyudov, I.M.; Ozhigov, L.S.; Parkhomenko, A.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

Investigations are reported of different kinds of irradiation (neutrons, electrons) on the anelastic relaxation properties for nickel and 0Kh16N11M3 steel with rare-earth additions. It was experimentally obtained, the grain boundary temperature of internal friction (Ke-peak) decreased. Effect connected with the fact that points of strong fasten appeared account of diffusion of scandium and praseodymium to the grain boundaries. 3 refs.; 4 figs. (author).

26636 (INIS-mf–13545, pp. 67-72) **Absorption of radiation vacancies by grain boundaries in metal and steels.** Grinik, Eh.U. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij); Totskij, A.Yu. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

The shift of internal friction grain boundary maximum temperature (Ke peak) versus the generation rate of point defects has been investigated in pure nickel, iron and platinum as well as in austenitic steel and Fe-^{11}B alloy. The obtained data allow to estimate the excess fluxes of both the radiation caused vacancies to grain boundaries and interstitials to dislocations. The method proposed enables to investigate point defect-impurity interaction and prognosticate the tendency of materials to radiation swelling. 8 refs.; 2 figs. (author).

26637 (INIS-mf–13545, pp. 73-80) **Cluster-loop structure influence on molybdenum radiation hardening.** Vagin, S.P. (AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki); Ibragimov, Sh.Sh.; Loktionov, A.A.; Reutov, V.F. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

Results on defect structure study and degree of molybdenum radiation hardening irradiated by fission neutrons and medium energy alpha-particles are presented. It is shown that molybdenum irradiation by alpha-particles and neutrons leads to different degree of material hardening for the same damage level. It is established that molybdenum radiation hardening is mainly defined by radiation defect clusters visible in electron microscope whose coefficient of rigidity depends on their size. 5 refs.; 6 figs.; 2 tabs. (author).

26638 (INIS-mf–13545, pp. 81-89) **Hydrogen permeability of constructor materials during ion bombardment.** Zaluzhnyj, A.G. (Moskovskij Fiziko-Tekhnicheskij Inst., Moscow (Russian Federation)); Kopytin, V.P.; Pestretsov, S.M.; Storozhuk, O.M.; Guseva, M.I.; Gorbatov, E.A.; Naftulin, O.S. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

There are described the results of the studies on the hydrogen permeability of polycrystalline nickel when hydrogen has been introduced from gas phase, from gas discharge and during ion bombardment. There are presented the data on the influence of implantation of light element ions (helium, oxygen, nitrogen and

carbon) on the hydrogen permeability of polycrystalline nickel and iron during hydrogen ion bombardment. 11 refs.; 4 figs. (author).

26639 (INIS-mf–13545, pp. 90-97) **Strain release of helium from irradiated metals and alloys.** Volkov, N.V. (Moskovskij Fiziko-Tekhnicheskij Inst., Moscow (Russian Federation)); Zaluzhnyj, A.G.; Kalin, B.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

The strain release of helium from nickel, Kh20N45M4 and 0Kh16N15M3 alloys is described. A strong influence of the implantation method, and helium concentration on the strain release is obtained. The results are discussed in terms of an interaction of helium atom and bubble with dislocation. 7 refs.; 5 figs. (author).

26640 (INIS-mf–13545, pp. 98-105) **On the structural-phase change of transition metals implanted by interstitial element ions.** Diasamidze, Eh.M. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Sukhumi (Russian Federation). Fiziko-Tekhnicheskij Inst.). AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

Structural-phase changes of transition metals under implantation by B^+,C^+,N^+,O^+,F^+ ions at room temperature are investigated. The dual character of structural transition versus a kind of ions: recrystallization or amorphization - is discovered. Short-range order parameters and charge states of impurity atoms are determined. In the work a mechanism of structural changes and amorphization is formulated according to which the character of transition determines by the energetic state of impurity atom electrons subsystem into implanted excited layer. The suggested configuration model of structural changes allows to determine the direction, the kind and critical dose of the structural transition under implantation. 22 refs.; 1 fig.; 3 tabs. (author).

26641 (INIS-mf–13545, pp. 106-113) **About the role of divacancies and di-interstitials in the theory of homogeneous nucleation of radiation-induced voids in metals.** Bondarenko, A.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.); Chernov, V.M. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

The system of stiff non-linear differential equations describing the kinetics of vacancy voids and interstitial dislocation loops nucleation and growth in pure metal (nickel) is solved with the high mobilities of divacancies and di-interstitials taken into account. The calculated time dependences of void nucleation rate are presented and discussed, the dependence of other values calculated, are briefly described. It is shown that the account of di-defects mobility results in significant increase of void nucleation rate. However, the rates obtained are not high enough to meet the void concentrations usually observed at highest temperatures of void formation. 13 refs.; 1 fig.; 1 tab. (author).

26642 (INIS-mf–13545, pp. 114-121) **The accumulation and annealing of radiation defects in iron-chromium alloys.** Arbuzov, V.L. (AN SSSR, Sverdlovsk (Russian Federation). Inst. Fiziki Metallov); Druzhkov, A.P.; Klotsman, S.M.; Nikolaev, A.L. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

By positron annihilation measurements a vacancy build-up kinetics during electron irradiation has been investigated for Fe-15.7 at%Cr alloy and IX13-type steel in the temperature range 260-373 K. Below 273 K a linear with dose vacancy build-up kinetics is observed for alloy and steel. This indicates that there is no recombination. It is proposed that it is caused by a high concentration of traps for radiation-induced interstitial atoms (IA). The change of vacancy build-up kinetics at 323K indicates the decrease of trap concentration in the alloy with the increase of irradiation temperature. A rise of S-parameter is observed at 398-423 K indicating the onset of vacancy migration. The decay of recovery and the change of its kinetics is observed with increasing of irradiation temperature. The effect of trapped IA on the annealing kinetics is discussed. 14 refs.; 3 figs. (author).

26643 (INIS-mf–13545, pp. 129-136) **Effect of defect local piles and dislocation multiplication on radiation hardening of metals.** Kamshilin, D.V. (AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Yadernoj Fiziki); Kirsanov, V.V.; Pyatiletov, Yu.S.; Tyupkina, O.G. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

Computer experiments imitating specimen strain on tension with constant deformation rate have been carried out. A formation possibility of atmosphere from defects around gliding dislocations (I) and a work of Frank-Read sources (II) have been accounted for. In result deformation curves until stresses do not exceed a critical shear stress were calculated. Influence of effects (I) and (II) was analyzed. It is determined that both by pass of dislocations over defect "atmospheres" and dislocation multiplication can cause a peak in flow stress occurrence on the deformation curves. Reasons and conditions of such peak occurrence have been studied. 12 refs.; 9 figs. (author).

26644 (INIS-mf–13545, pp. 137-146) **On kinetics of accumulation of He and H simultaneously implanted in metal.** Bakaj, A.S. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Krasil'nikov, V.S. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

It was found that simultaneous implantation of He and H in metals leads to diffusion transport of He on distances exceeding mean projected range of ions by factor of several orders. Accumulation of He and H within the bulk of metal and development of gas porosity are observed. The coefficient of He transfer in Al is greater than 2 $10^{-7}cm^2/s$. To explain experimental evidences He-atoms are assumed to migrate in the form of fast diffusing complexes with H and vacancies (He-H-V or He-H-2V). The model kinetic equations describing experimental observations are derived. 8 refs. (author).

26645 (INIS-mf–13545, pp. 147-154) **Phase structure and microhardness of zirconium irradiated with carbon, nitrogen and boron ions.** Lysova, G.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.); Gudkov, L.S.; Panin, S.D.; Chernov, V.M. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

Phase composition and microhardness changes of the surface layers of zirconium were investigated after 70 keV C^+,N^+_2 and B^+ ion implantation at 10^{17}-10^{18} ion/cm^2 irradiation doses and target temperatures 30^0C and subsequent annealing. 7 refs.; 3 figs.; 2 tabs. (author).

26646 (INIS-mf–13545, pp. 155-161) **Coalescence of migrating bubbles as a mechanism of grain boundary helium porosity development in a high temperature radiation embrittlement problem.** Chkuaseli, V.F. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.). AN Ukrainskoj SSR, Kharkov

(Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

The mechanism and the results of modelling of the grain boundary gas porosity development concerning the problem of high temperature radiation embrittlement of austenitic stainless steel are presented. By comparing the model results with experimental data it is shown, that the coalescence of random migrating bubbles as a bubble nucleation and growth mechanism can explain the basic features of the porosity formed on the grain boundary. It is also concluded, that the further specification of stress influence on this process is necessary. 19 refs.; 2 figs. (author).

26647 (INIS-mf–13545, pp. 171-177) **Investigation of the radiation creep bcc-materials with the help of anisotropic diffusion vacancy simulation in nuclei edge dislocations.** Borodin, V.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Atomnoj Ehnergii); Kevorkyan, Yu.P.; Kolomytkin, V.V.; Ryazanov, A.I. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

Numbering modelling permitted to determine vacancy migration energy parameters in a boundary dislocation nucleus [100] <010> in α-iron and to evaluate them on the basis of polarization tensor diagonal components in nucleus dislocation. The obtained results permit to evaluate the radiation creeping rate which is determined by the efficiency of vacancy absorption by dislocations and is close to experimentally observed values. 11 refs.; 1 fig.

26648 (INIS-mf–13545, pp. 178-183) **The influence of different factors on sputtering of metallic alloys under ion bombardment.** Bondarenko, G.G. (Moskovskij Inst. Ehlektronnogo Mashinostroeniya, Moscow (Russian Federation)); Kucheryavyj, S.I.; Korzhavyj, A.P.; Sigov, D.N. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

The influence of different factors - redeposition, surface oxidation and target geometry - on ion sputtering of metallic alloys is considered. It was found that considerable reduction of sputtering rate in aluminium-lithium alloys is caused by the effect of continuous reconstruction of protecting lithium layer. The results are interpreted in terms of both Gibbsian and radiation-induced segregation effects. 5 refs.; 4 figs. (author).

26649 (INIS-mf–13545, pp. 184-189) **Evolution of radiation defects attached to the annealing of nickel implanted by xenon to concentration of 0.08...1at%.** Tolstolutskaya, G.D. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Kopanets, I.E.; Neklyudov, I.M.; Bendikov, V.I.; Rybalko, V.F. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

Evolution of radiation defects in Ni <110> single crystals implanted by Xe^+ ions (energy E=600 keV) to fluences of $2{,}5x10^{15}$ - $2.5x10^{16} cm^{-2}$ during the process of isochromous post-implantation annealing at temperature range from 300 to 1300 K with step of 100 K was investigated by methods of backscattering of channeled ions, TEM, thermodesorptional spectrometry. It had been shown that part of Xe atoms in substitutional lattice location reduces with growth of irradiation dose and temperature of annealing. The annealing of irradiated samples leads to reducing of density of dislocations, to formation under $T \approx 900$ K the bubbles of high pressure, where Xe is in crystalline state, while under $T > \approx 1100$ K it leads to generation of equilibrium bubbles. 2 refs.; 6 figs. (author).

26650 (INIS-mf–13545, pp. 190-197) **Dispersion and amorphization of nickel-titanium under mechanical and radiation treatment.** Bryk, V.V. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Malykhin, D.G.; Polyakov, Yu.I.; Sleptsov, S.N.; Chernyaeva, T.P. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

Considered is the structure of nickel-titanium, dispersed and carried to amorphization by three methods: (i) plastic deformation, (ii) ion irradiation, and (iii) ion-plasma flux deposition on to a cold substrate. The structures of nickel-titanium subjected to these three types of treatment are found to be similar but not identical. Nickel-titanium deformed by 50 to 90% has a conglomerate structure, where microcrystalline particles are in the amorphous matrix. Out of the treatment types considered, it is ion irradiation that leads to the greatest degree of amorphization (appearing as a quasi-liquid state). The deposition of ion-plasma fluxes on to a cold ($20\text{-}30^0$C) substrate causes the formation of condensates with a para crystalline structure. 9 refs.; 3 figs. (author).

26651 (INIS-mf–13545, pp. 162-170) **The comparative investigation of the embrittlement of the irradiated steels and alloys with volume-centered and face-centered cubic lattices.** Neklyudov, I.M. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Ozhigov, L.S.; Parkhomenko, A.A.; Afrikanov, I.N. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 6.* [218p.] Order Number DE93630454. Source: OSTI; NTIS (US Sales Only); INIS.

Here are given the results of the investigation of the inclination towards embrittlement of the irradiated materials with different types of the crystal lattice: the austenitic stainless steels including the steels with the micro additives of the rare-earth metals (the face-centered cubic lattice), ferrite-martensitic steels, Fe-45% Cr of the super pure alloy, of the low chromium alloy, the monocrystal of chromium (the volume-centered cubic lattice) irradiated by (e,γ)-beam up to the fluids $10^{-2}\text{-}5x10^{-1}$dpa. The investigations have shown that in the area of the low-temperature embrittlement of the irradiated materials the value of the effect is determined by the degree of hardening as a result of radiation dependable on the microstructure of the material. In the area of the high-temperature irradiation embrittlement of the face-centered cubic lattice investigated display the increase of after-irradiation ductility (plasticity) with the growth of temperature during the test. The microalloying of the rare-earth metals reduces the effect of the high temperature irradiation embrittlement of the austenitic stainless steel. 9 refs.; 6 figs. (author).

26652 (INIS-mf–13546) **Radiation materials science. V. 7.** Zelenskij, V.F. (ed.). AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. [226p.] (In Russian, English). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

This volume includes the papers of the international conference on radiation materials in Alushta, Ukraine in May 1990. The main topics are: basic research in radiation damage physics, a study of the structural materials for reactor cores; irradiation effect on reactor vessel, fuel, super- and semiconductor materials; investigation damage research methods.

26653 (INIS-mf–13546, pp. 3-8) **Heat conductivity of irradiated GaP crystals and details of their thermal annealing.** Nikogosyan, S.K. (Erevanskij Fizicheskij Inst., Erevan (Armenia)); Saakyan, V.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

The results of measurement of the heat conductivity (H) of GaP samples are presented as a function of the dose of electron radiation with E=50 MeV and after an isochronous annealing. The data analysis brought us to an inference that at irradiation there arise intrinsic radiation defects (IRD) which are identified as antisite defects of the phosphorus. A possibility of formation of complexes between these IRD is assumed at both irradiation and annealing. It is supposed that the essential difference observed between the results of n- and p-type samples annealing H is due to different mobility of the radiation effects. It is fixed that the defects in crystals with iron impurities are thermally more stable than in crystals with zinc impurities. 4 figs.; 19 refs. (author).

26654 (INIS-mf–13546, pp. 9-18) **Magnetic state of $Fe_{69.5}Ni_{30.5}$ alloy with bcc-fcc transitions induced by ion irradiation.** Ovchinnikov, V.V. (Institut Ehlektrofiziki, Ural'skoe otdelenie RAN, Sverdlovsk (Russian Federation)); Kogan, Yu.D.; Gavrilov, N.V.; Shtol'ts, A.K. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

The bcc-fcc transitions in Fe+30,5 at.% Ni alloy have been investigated by the ion bombardment. By nuclear γ-resonance method it has been found that a wide spectrum of various magnetic states of fcc-phase can be obtained as a fluence, an amplitude, a pulse rate under irradiation in pulse-repetition regime. Some of these states are similar to those appearing at high pressure in some tens kilo bars. The densities of P(H)-probabilities of effective-magnetic field distribution on ^{57}Fe nuclei which are representative of the magnetic-moment z-projection distribution of Fe and Ni atoms on the crystal lattice sites have been calculated. 8 refs.; 3 figs. (author).

26655 (INIS-mf–13546, pp. 19-22) **Studies of radiation effect on shape memory alloys.** Sinel'nikov, L.P. (Nauchno-Issledovatel'skij i Konstruktorskij Inst. Ehnergotekhniki, Moscow (Russian Federation)); Loguntsev, E.N.; Kozlov, A.V.; Kovalev, I.N.; Abramov, V.Ya.; Litvin, D.F.; Ionajtis, R.R. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

The investigation of in-core radiation influence on shape memory alloys of Mn-Cu and Fe-Mn types is carried out. The alloys 80% Mn-20% Cu, 75% Mn-22% Cu-3% Cr and Fe-31% Mn-5% Si were irradiated in first circuit water of a research reactor at the temperature of 60^0C and up to the fluence of $1x10^{19}$, $5x10^{19}$ and $1x10^{20}$n/cm^2 (E$\geq$0,5 MeV). It is shown that the shape reduction takes place with heating for all the samples except Fe-31%Mn-5%Si alloy samples, irradiated up to the fluence of $1x10^{20}$n/cm^2. The shape reduction degree is noted to decrease with fluence increase. 2 refs.; 4 figs.

26656 (INIS-mf–13546, pp. 23-26) **Effect of electron beam treatment on diffusion of copper into a titanium base layer.** Barinov, V.I. (AN Belorusskoj SSR, Minsk (Belarus). Inst. Yadernoj Ehnergetiki); Vashchenko, S.V.; Fedyushin, E.E. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

The results are presented of the investigation into the thermo radiation diffusion of copper from a galvanic coating into the depths of a titanium base layer made of two-phase α+β-alloys (BT6 and BT23 types) under the effect of a 15-20 KeV electron beam both in the continuous and pulse modes of treatment with a frequency of 5 Hz. It is found the effect of electron current results in the change in the surface physical state, i.e. the change in the energy of an atomic boundary layer, formation of vacancies and dislocations lowering the activation energy of diffusion processes. The results obtained are explained from the position of irreversible processes with allowance for the influence and super-imposing of elementary fluxes. 7 refs.

26657 (INIS-mf–13546, pp. 27-37) **Phase transitions in the transient metal oxides under electron irradiation.** Stepanov, V.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.); Chernov, V.M.; Kryukova, L.M. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

The kinetics of V_2O_5 and MoO_3 monocrystal structural changes has been investigated under electron irradiation with various energies (80-1000 keV). Irradiation with various energies and/or in different crystallographic directions results in formation of various phases. The oxygen vacancies concentration-dependent phases diagram has been built under different irradiation conditions with allowance for their dipole-dipole interaction. 7 refs.; 5 figs.

26658 (INIS-mf–13546, pp. 46-53) **Radiative effects and properties of refractory metals with the bcc and hcp.** Zakharova, M.I. Results of swelling, temperature dependence of electric resistance, internal friction, elasticity modules of monocrystal samples of molybdenum, tungsten, vanadium, niobium (BCC- <100>, <110>, <111>) and rhenium (HCP-<0001>) after neutron irradiation up to the fluence of $1,14x10^{26}$ n/m^2 (E>0.1 MeV) at the temperature of 460^0C and isochronous annealing up to 0.7 T_m are presented. Some features of behaviour of metals with the BCC and HCP lattices, metals of the V and VI groups of the periodic system and the role of interstitials impurities in relaxation processes development and in changing their physical and mechanical properties under irradiation are discussed. 3 refs.; 6 figs.; 1 tab.

Source: OSTI; NTIS (US Sales Only); INIS.

Computer simulation was used to investigate the evolution of the spot emitting scattered particles on amorphous materials TaC and Ni irradiated by a Ne^+ ion beams with an energy ranging from 100 eV to 10 keV and angle of incidence $\alpha=0^0$. It is shown that the growth rate of the spot falls and the entirely ceases with the incident ion energy increase above E_{ic} (E_{ic} is the critical energy). This is explained by predominant incident ion energy dissipation inwards the target material rather than in the direction along the subsurface layer. 2 refs.; 4 figs.

26660 (INIS-mf–13546, pp. 59-63) **Sputtering of graphite, niobium and niobium carbide by neutron bombardment. Computer simulation.** Kamenev, A.S. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Nikiforov, V.I.; Pavlenko, V.I.; Khirnov, V.I. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

Sputtering yields of graphite, niobium and niobium carbide by neutron irradiation were obtained by computer simulation. It is shown that the niobium sputtering yield in niobium carbide is by

factors 4 to 10 less than that in pure niobium (under the same initial conditions). It is also found that niobium carbide irradiation by fast neutrons may give rise to sputtering (≈40%) carbon atoms with a high average energy E≈>100 eV. 8 refs.; 2 figs. (author).

26661 (INIS-mf–13546, pp. 64-77) **Hydrogen permeation in stainless steel type 12 Cr18NI10T under neutron -and gamma - irradiation conditions.** Gerasin, V.Ya. (Nauchno-Proizvodstvennoe ob"edinenie "Luch", Semipalatinsk (Russian Federation)); Eremeev, V.S.; Basov, A.V.; Kenzhin, E.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

Hydrogen permeation in steel type 12Kh18N10T in reactor-radiation with neutron - and gamma-quantum density flux $3x10^{10}$nxcm^{-2}xc^{-1} and 10^{9}cm^{-2}xc^{-1} correspondently with summarized radiation dose 5x10^{1}'5cm^{-2} in temperature range 673-973 K, with hydrogen pressure 0,3 MPa is studied. Description of technique and test plant is given and the achieved results are discussed here. The remarkable unreversible increase of hydrogen permeation through steel and some reduction of energy activation under reactor irradiation was found. 7 refs.; 4 figs. (author).

26662 (INIS-mf–13546, pp. 78-85) **The influence of implanted helium on nickel radiation resistance under conditions simulating plasma flux disruption in nuclear fusion reactor.** Kalin, B.A. (Moskovskij Inzhenerno-Fizicheskij Inst., Moscow (Russian Federation)); Pol'skij, V.I.; Yakushin, V.L.; Tserevitinov, S.S.; Vasil'ev, V.I.; Markin, A.V. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

The paper presents the results on Nuclear Fusion Reactor (NFR) first wall materials radiation erosion caused by a series of impulses to simulate plasma disruption and by 40 keV helium ion fluxes with doses $2x10^{21}m^{-2}$ and $1x10^{22}m^{-2}$. The series in question consisted of 2-10 impulses of high-temperature D-plasma fluxes (IHTPF) with incident power density up to $2x10^{10}W/m^2$. Prior exposure to IHTPF has been found to come a substantial increase of the material resistance to erosion under the action of subsequent ion irradiation. Exposure to IHTPF at the late stages of ion bombardment results in a sharp change of material (material surface) structure with new blisters appearing and breaking with open porosity and cracking. At the high doses of ion bombardment ($\Phi>\Phi_{th}$) an almost complete helium release is observed while at lower doses ($\Phi<\Phi_{th}$) only about 50%. 7 refs.; 3 figs.; 2 tabs.

26663 (INIS-mf–13546, pp. 92-97) **The effect of noble gas implantation of corrosion of metals and alloys.** Zelenskij, V.F. (AN Ukrainskoj SSR, Kharkov (Ukraine). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

Corrosion behaviour of zirconium, O4KH16N15M3B steel, copper, Zr-1%Nb and Zr-2.5%Nb alloys is studied under irradiation with helium and argon ions. After irradiation with He or Ar in the dose range between $5x10^{5}$ and $5x10^{17}$ ion/cm^2, all the samples, irrespectively of their mechanism of oxidation (Zr,Cu) showed an improved corrosion resistance. This improvement value depended on the species of the particles and the dose. Kinetics of ion thermodesorption from irradiated materials is also investigated. On the basis of the available literary data and the present experimental results, possible mechanisms leading to the improved corrosion resistance of the materials are discussed. 9 refs.; 7 figs. (author).

26664 (INIS-mf–13546, pp. 132-138) **Some characteristics properties of structure of stainless steel pipe blanks produced by vacuum centrifugal casting for nuclear power.** Zelenskij, V.F. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Neklyudov, I.M.; Chernyj, B.P. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

Results of studies macro- and microstructures of centrifugal castings and distributions of inclusions and alloying elements and impurities are presented. It was established that distribution of components of steels in castings is uniform. The macro structure is band and the microstructure is dendritic. Principal feature of centrifugal castings is redistribution of inclusions, main part of casting being free from conclusions. 1 refs.; 4 figs.; 3 tabs. (author).

26665 (INIS-mf–13546, pp. 139-145) **Microstructural evolutions in ferritic-martensitic Kh12MVFR-type steel during irradiation and the effect of these evolutions on its radiation resistance capability.** Ioltukhovskij, A.G. (Nauchno-Proizvodstvennoe Ob"edinenie Ehnergiya, Moscow (Russian Federation)); Leont'eva-Smirnova, M.V.; Zhukov, A.G.; Zelenov, V.I.; Barsanov, V.I.; Kozlov, A.V.; Kolbenkov, S.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

Microstructural evolutions in ferritic-martensitic Kh12MBFP-type steel during irradiation and the effect of these evolutions on its radiations resistance capability are described. Microstructural evolutions in 12% Cr Kh12MBFP-type steel during neutron irradiation (E>0.1 MeV) to the fluence $2x2x10^{27}n/m^2$ under 385-460^{0}C are observed both in δ-ferrite and sorbite zones. Significant interaction of the irradiation induced point defects with impurity atoms and high density dislocation pile up results in the evolution of the dislocation structure in sorbite, precipitation of $Me_{23}O_6$ and MeC as well as precipitation of globular χ-phase in δ-ferrite. Porosity generation and related swelling are not observed. Significant accumulation of the irradiation induced defects causing embrittlement does not occur. 5 refs.; 6 figs.; 1 tab. (author).

26666 (INIS-mf–13546, pp. 174-180) **Employment of ferritic steels for fbr fuel element cladding in high temperature conditions.** Dolmatov, P.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.); Popov, V.V.; Khmelevskij, M.Ya. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

Fuel and cladding interaction in fuel elements result in local corrosion pits on the inner surface of ferritic cladding. The results of calculations of stresses in cladding near by corrosion pit were obtained with finite element method application and shown in this paper. Corrosion pits lead to a great concentration of stresses, therefore in the consideration of a cladding lifetime it is necessary to use special calculations instead of thickness decreasing approach. 2 refs.; 5 figs.; 2 tabs. (author).

26667 (INIS-mf–13546, pp. 111-116) **Influence of neutron irradiation and self-irradiation on crystal structure of Pu-Al and Pu-Ga δ-phase alloys.** Inozemtsev, V.V. (Vsesoyuznyj Nauchno-Issledovatel'skij Inst. Neorganicheskikh Materialov, Moscow (Russian Federation)); Panteleev, L.D.; Chebotarev, N.T. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

The influence was studied effected by neutron irradiation (NI) to fluences of $1.5x10^{15}$-$3x10^{17}$ thermal n/cm^2 and prolonged self-irradiation (SI) at temperatures ≈ 70^{0}C on the crystal structure of Pu-Ga and Pu-Al δ-phase alloys. It is shown that the metastable δ-phase of all the alloys indicated is resistant to NI. It is established that the irradiation of the alloys increases the lattice parameters

depending on the Ga, Al concentration in the lattice of the δ-phase and leads to the anisotropic broadening of X-ray lines. NI and SI effected changes of the fine X-ray structure are mainly related to the realization the covalent constituent of the interatomic bond of atoms in the δ-crystal lattice. This realization becomes feasible due to the accumulation and evolution of irradiation induced defects that provide for a partial relaxation of internal stresses. 5 refs.; 4 figs. (author).

26668 (INIS-mf–13546, pp. 146-152) **In-reactor creep of steels and alloys with various Fe-Cr-Ni bases in the BN-350 commercial fast reactor.** Budylkin, N.I. (Vsesoyuznyj Nauchno-Issledovatel'skij Inst. Neorganicheskikh Materialov, Moscow (Russian Federation)); Mironova, E.G.; Vorob'ev, A.N.; Dmitriev, V.D. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

The results of the materials in-reactor creep investigations performed on tube specimens are presented. The dependences of creep parameters on the level of specified stresses of 0-300 MPa and doses of 20-60 dpa have been obtained. It has been established that separate alloying of B,C and joint alloying of B,Ti,Al result in considerable reduction of the in-reactor creep strain. The 20% cold working of tubes differently affects the change in the creep parameters at 480^{0}C. 5 refs.; 5 figs. (author).

26669 (INIS-mf–13546, pp. 153-158) **Estimation of the effect of operation on deformation of BN-600 fuel assembly tubes and fuel pin cladding fabricated of austenitic Cr/Ni steel.** Larin, E.P. (Nauchno-Proizvodstvennoe Ob"edinenie Ehnergiya, Moscow (Russian Federation)); Ioltukhovskij, A.G.; Andrianov, A.N.; Shejnkman, A.G.; Kireev, M.G. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

The formulae given in this paper describe relationship between structural elements deformations and operational factors (i.e. temperature, damage doze). Measurement results obtained following irradiation of fuel cladding (type Kh16N15M3B steel, austenitized) and fuel assembly tubes (type O8Kh16N11M3 mechanically and thermally treated) are in good agreement with the design values. Based on these formulae models to assess temperature of fuel claddings and fuel assembly tubes during irradiation have been developed. In particular it is proposed to use the radiation of elongated cladding to maximum increased of its diameter. These models allow to assess temperature deviations in the core and inside separate fuel assemblies. 4 refs.; 6 figs. (author).

26670 (INIS-mf–13546, pp. 159-166) **Investigation of kinetics of nucleation and propagation crack in 0Kh16Ni15M3B austenite stainless steel specimens after annealing and irradiation.** Dorovskoj, V.M. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Atomnoj Ehnergii); Elesin, L.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

Experimental results of microcrack nucleation process and propagation kinetics of austenite stainless steel after annealing and neutron irradiation are presented. They were obtained by method in-situ electron microscope. A pseudostereomethod was applied to estimate qualitatively stress field in material region located around the crack tip. It was found that around a crack there were regions with tensile and compressing stresses. Radiation defects in a neutron-irradiation material structure were absent in local regions with prevailing tensile stress. 6 refs.; 8 figs. (author).

26671 (INIS-mf–13546, pp. 167-173) **Fracture mechanics behaviour of neutron irradiated austenitic steel 0Kh16N15M3B.** Likhachev, Yu.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.); Troyanov, V.M.; Gibadulin, R.Kh.; Popov, V.V.; Ermolaev, S.N. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

The neutron irradiation of structural materials results in decreasing of fracture toughness. In this article a special experiment for definition of fracture toughness K_c and J_c on the irradiated specimens is described. Specimens were made from austenitic steel 0Cr16Ni15Mo3Nb and irradiated in reactor BN-600 to a maximum flux about $2x10^{23}$n/cm^2 by a temperature 450^{0}C. Specimens were tested in tensile condition at the 450^{0}C. A critical coefficient K_c was obtained with using a 5 percent offset technique. For the ductile materials a value of J_c was obtained with using a Rice's correlation. 4 refs.; 4 figs.; 2 tabs. (author).

26672 (INIS-mf–13546, pp. 181-188) **Tensile properties of high nickel-base alloys Kh18N40M3B and nimonic PE-16 irradiated to neutron damage level of 60 dpa.** Vorob'ev, A.N. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.); Ermolaev, S.N.; Vakhtin, A.G.; Budylkin, N.I.; Mironova, E.G. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

Tensile properties of Kh18N40M3B alloy with and without boron, titanium and aluminium additions and of Nimonic PE-16 alloy were measured after neutron irradiation at 500+-20^{0}C up to damage level of 60 dpa (TRN). The strength and ductility of these alloys were determined as a function of test temperature ranging from 300 to 750^{0}C. The severe embrittlement was found for alloys doped by Ti and Al. All alloys investigated demonstrate high temperature irradiation embrittlement at test temperature above 550^{0}C. 5 refs.; 4 figs.; 2 tabs. (author).

26673 (INIS-mf–13546, pp. 106-110) **Hydrogen permeation in austenite steels under neutron irradiation.** Polosukhin, B.G. (Nauchno-Issledovatel'skij i Konstruktorskij Inst. Ehnergotekhniki, Moscow (Russian Federation)); Zyryanov, A.P.; Baskakov, E.P. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

Influence of fast neutrons from reactor on Kh18N10T and Kh16N11M3T austenitic steels penetrability for hydrogen was studied. These steels are candidates as construction materials for thermonuclear reactors and such parameters of hydrogen transfer as penetrability, diffusion, solubility were investigated in them during and after irradiation in reactor. 3 refs.; 3 figs. (author).

26674 (INIS-mf–13546, pp. 117-124) **Dispersion hardening and radiation damage in austenitic stainless steels.** Sagaradze, V.V. (AN SSSR, Sverdlovsk (Russian Federation). Inst. Fiziki Metallov); Nalesnik, V.M.; Lapin, S.S. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

Radiation swelling and structure of austenitic steels Kh16Ni15M3 and Kh12Ni30M3 doped by Ti,Al,Si was studied after irradiation in BN-600 reactor up to the damaging dose 60 dpa at 480-500^{0}C. It was shown that the swelling after irradiation was considerably less in Kh16 steel with 1%Ti comparing with steels without Ti and with 0.3 mass%Ti. 6 refs.; 1 fig.; 2 tabs. (author).

26675 (INIS-mf–13546, pp. 125-131) **The effect of the tensile stress on the swelling and microstructure of the stainless steels irradiated to high neutron fluence.** Porollo, S.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR,

Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.); Dmitriev, V.D.; Vorob'ev, A.N.; Budylkin, N.I.; Mironova, E.G. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

The void swelling and microstructure of the 0Kh16N15M3B and 0Kh16N15M3BP austenitic steels after irradiation in BN-350 reactor to displacement doze of 60 dpa at 480^{0}C versus the applied stress have been studied. The swelling of those steels was found are linear with the biaxial tensile stress changing over the range 0/196 MPa. Swelling modulus, therewith was equal to $5x10^{-3}MPa^{-1}$ and $9.2/15.8x10^{-3}MPa^{-1}$ for the 0Kh16N15M3B and OKh16N15M3BP steels respectively. The stress effects the void number density increase without any significant changes of the void size. 2 refs.; 5 figs.; 1 tab. (author).

26676 (INIS-mf–13546, pp. 189-195) **Void swelling of hexagonal wrappers of BN-600 sub-assemblies.** Vakhtin, A.G. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.); Porollo, S.I.; Dmitriev, V.D.; Aleksandrov, Yu.I. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

The void swelling of the hexagonal wrappers fabricated from O8Kh16N11M3 (thermo mechanically) O8Kh16N11M3T-20% cold working (CW) and O7Kh15N13M2T (20% CW) steels and irradiated up damage level of 70 dpa (TRN) was studied. For O8Kh16N11M3 steel void swelling at wrapper corners was found to be 3-4 times larger then at wrapper flats. For cold-worked steels the adverse effect has been observed. This is due to the difference of steel microstructure at flats and corners of the wrappers. 2 refs.; 5 figs.; 2 tabs. (author).

26677 (INIS-mf–13547) **Radiation materials science. V. 8.** Zelenskij, V.F. (ed.). AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. [232p.] (In Russian, English). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

This volume includes the papers of the international conference on radiation materials in Alushta, Ukraine in May 1990. The main topics are: basic research in radiation damage physics, a study of the structural materials for reactor cores; irradiation effect on reactor vessel, fuel, super- and semiconductor materials; investigation damage research methods.

26678 (INIS-mf–13547, pp. 63-67) **Investigation of quench induced faults in the hcp crystalline structure of zirconium alloys.** Sharov, B.N. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Teoreticheskoj i Ehksperimental'noj Fiziki); Chizhikov, Yu.B. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

A simple geometrical model of hcp is used to prove by means of X-ray diffraction the existence of stacking faults in the hcp structure of zirconium alloys Zr+1%Nb and Zr+2.5%Nb. These faults are found to be thermally-stable. Its effect on the irradiation-induced faults evolution is suggested. 7 figs. (author).

26679 (INIS-mf–13547, pp. 41-46) **Irradiation effect on corrosion cracking of WWER reactors fuel element claddings ion iodium and cesium iodide medium.** Stupina, L.N. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (Russian Federation)); Shamardin, V.K.; Kobylyanskij, G.P. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

Strength of WWER reactors fuel element simulators in an aggressive fission products medium (iodium and cesium iodide) at temperature 380^{0}C was investigated. Experimental results of reactor irradiation effect on stress corrosion cracking (SCC) of the Zr-1%Nb alloy cladding tubes were presented. Identity of destruction mechanisms with iodium and cesium iodide was shown. Influence of fast neutron fluence to $5x10^{25}m^{-2}$ on destruction stress under SCC conditions was established. 4 refs.; 4 figs. (author).

26680 (INIS-mf–13547, pp. 3-6) **Creep of irradiated austenitic Kh16N15M3B steels at temperatures 300-700^{0}C.** Rogozyanov, A.Ya. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (Russian Federation)); Gorbatov, V.K.; Samsonov, B.V. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

Dependence of the fixed creep rate of irradiated austenitic Kh16N15M3B steels upon stress σ and temperature T was investigated. The tests were conducted in the RBT-6 reactor with the fast neutron flux density $\phi=3x10^{17}m^{-2}s^{-1}$ (E>0.1 MeV) and partially (with stresses below the yield limit σ_T) in the SM-2 reactor with $\phi=2x10^{18}m^{-2}xs^{-1}$ and T=300-700^{0}C. The fixed creep rate of alloys under investigation can be described by the following relationship: $\varepsilon=(B_o+Bxk)\sigma+A\sigma^n xexp(-U/8,31T)$, where A,B,$B_0$,n are factors, U is the energy of activation, K is the rate of radiation damage. Factor A depends on ϕ, and also on the neutron fluence at T=300-500^{0}C. The dependence describes all the mass of data according to different steel modifications with one and the same basis within a wide range of stresses and temperatures. 4 refs.; 2 figs.; 1 tab. (author).

26681 (INIS-mf–13547, pp. 7-14) **A study of the phase structure of radiation-resistant steel.** Neklyudov, I.M. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Chernyj, B.P.; Vanzha, A.F.; Rabinovich, A.V.; Milova, I.M.; Zaslavskij, Yu.B. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

Results from studies of microstructure and phase structure of the radiation-resistant steel O6Kh16N15M2T with micro additions of scandium are presented. It is shown that the quantity and composition of the precipitated phases are determined by the content of scandium, phosphorus, interstitial oxygen and nitrogen. Influence of homogenizing annealing on the phase, structure and dissolution kinetics of the precipitated phases is studied. The ultimate scandium solubility in the steel O6Kh16N15M2T at 1270^{0}C is 0.06 wt.%. 4 figs.; 2 tabs. (author).

26682 (INIS-mf–13547, pp. 22-27) **Changes in zirconium microstructure and properties under LOCA simulation conditions.** Mojnov, A.S. (Vsesoyuznyj Nauchno-Issledovatel'skij Inst. Neorganicheskikh Materialov, Moscow (Russian Federation)); Nikulina, A.V.; Bibilashvili, Yu.L.; Glazkov, A.G.; Sidorenko, V.I. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

The influence of oxidation at 1000-1200^{0}C on changes in microstructure and properties of Zr1%Nb clads was investigated. The results are presented it is shown that with the extent of oxidation increased the strength properties of clads are drastically reduced. The data are given on the cladding material saturation with oxygen and hydrogen. 7 refs.; 3 figs. (author).

26683 (INIS-mf–13547, pp. 28-34) **Strength of technological channel tubes.** Vasnin, A.M. (Nauchno-Issledovatel'skij i Konstruktorskij Inst. Ehnergotekhniki, Moscow (Russian Federation)); Rivkin,

E.Yu.; Rodchenkov, B.S.; Sinel'nikov, L.P. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

A prolonged strength of materials used in technological channels of RBMK reactors at 300-350^{0}C temperature range was determined. It was shown that the prolonged strength of zirconium alloys increases after neutron irradiation. Critical lengths of cracks for normal conditions of operation are calculated. 5 refs.; 5 figs.; 2 tabs. (author).

26684 (INIS-mf–13547, pp. 35-40) **Radiation growth of zirconium alloys.** Abramov, V.Ya. (Nauchno-Issledovatel'skij i Konstruktorskij Inst. Ehnergotekhniki, Moscow (Russian Federation)); Golovachev, M.G.; Kalachikov, V.E.; Rodchenkov, B.S. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). Source: OSTI; NTIS (US Sales Only); INIS.

Results of radiation swelling investigations in Zr-Sn-Nb-Fe alloy of high strength as well as in Zr-2.5Nb alloy which is characterized by a high corrosion stability, resistance to creeping and low hydrogen absorption are presented. 3 refs.; 3 figs.; 1 tab. (author).

26685 (INIS-mf–13547, pp. 47-54) **The structural-phenomenological description of plastic anisotropy of H-1 and H-2.5 alloys, subjected to reactors irradiation.** Yamshchikov, N.V. (Moskovskij Inzhenerno-Fizicheskij Inst., Moscow (Russian Federation)); Prasolov, P.F.; Lebedinskij, K.B. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

The structural-phenomenological model of anisotropic single hpc textured polycrystals is described. The formulation of the present model is assumed that the polycrystal is continuous three-dimensional collection of transversal crystallites, the plastic properties which Hill's yield criteria are described. This model is allowed to determine six parameters in the Hill's yield criteria for ortho tropic materials based on only of uniaxial tension test in three directions and crystallographic texture. Yield surfaces of zircaloy alloys at 293 K and 623 K, subjected to irradiation in the reactor with total exposition dose 10^{20}n/cm^2 are determined. Strongly influence of irradiation on the plastic behaviour of H-1 and H-2,5 alloys is observed. 2 refs.; 3 figs.; 2 tables. (author).

26686 (INIS-mf–13547, pp. 55-62) **Anisotropy of irradiation strengthening of textured zirconium alloys H-1 and H-2.5.** Prasolov, P.F. (Moskovskij Inzhenerno-Fizicheskij Inst., Moscow (Russian Federation)); Lebedinskij, K.B.; Platonov, P.A.; Viktorov, V.F. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

Strength and plastic alloy properties before and after in-pile irradiation up to integral dose of 10^{20}n/cm^2 were obtained on the samples machined from the plate of master alloys H-1 and H-2.5 in the main ortho tropic directions. Uniaxial tension-compression tests were done under T-293,623 K and with the strain rate of about $10^{-3}c^{-1}$. Irradiation strengthening anisotropy is shown to depend on the alloy composition. Irradiation is proved to decrease alloy anisotropy. Quality evaluation of the alloy anisotropy is given. The method of predicting strength properties of irradiated materials is presented. 5 refs.; 3 figs.; 3 tabs. (author).

26687 (INIS-mf–13547, pp. 98-102) **Physical nature of strengthening of chromium under irradiation.** Trefilov, V.I. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Zelenskij, V.F.; Neklyudov, I.M. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

The results of investigation of radiation strengthening and embrittlement of chromium and its small-doped alloys in wide interval of radiation doses ($5x10^{23}$ ... $2x10^{27}$n/m^2) and temperatures (20...800^{0}C) are presented. It is established that there is a strong dependence between radiation strengthening chromium and the of interstitial impurities (N,C,O) in it, also between radiation embrittlement and swelling. It is shown that micro doping chromium by high-active oxide-, nitride- and carbide-forming elements with a large atom radius as as Sc, Nb prevents impurite segregation and as a consequence, reduces the radiation swelling, strengthening and embrittlement. 5 refs.; 2 figs. (author).

26688 (INIS-mf–13547, pp. 15-21) **Quality improvement of radiation-resistant steels by filtration.** Zelenskij, V.I. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Neklyudov, I.M.; Chernyj, B.P. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

Results from laboratory studies of the influence of metal deoxidation, material and design properties of ceramic magnesia and aluminia filters on stainless steel refining are presented. It is shown that the use of ceramic filters allows one to decrease the number of coarse non-metal inclusions in castings. 11 refs.; 2 figs.; 1 tab. (author).

26689 (INIS-mf–13547, pp. 125-131) **A steel with a high neutron absorption cross section for nuclear reactor protection control systems.** Zelenskij, V.F. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Neklyudov, I.M.; Chernyj, B.P.; Nevorotin, V.K.; Fedorov, V.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

A gadolinium-alloyed steel O3Kh16N15M3B has been studied. Alloying with 0.02-1.0% gadolinium did not essentially affect the amount of non-metal inclusions in the steel. At test temperatures between 20 and 570^{0}C, the stress-strain properties of the steel with 0.02-0.5% of gadolinium correspond to the properties of the primary steel. X-ray analysis has shown a 0.05-0.11 wt% ultimate Gd solubility in the steel. The steel with 0.02-1.0% gadolinium did not develop the intergranular corrosion. The indices of weldability of both the primary steel and the steel alloed with gadolinium remain at the same level. 3 refs.; 7 figs.; 1 tab. (author).

26690 (INIS-mf–13547, pp. 144-150) **The mechanism and mathematical model of nodule (spot) corrosion of zirconium alloys.** Perekhozhev, V.I. (Nauchno-Issledovatel'skij i Konstruktorskij Inst. Ehnergotekhniki, Moscow (Russian Federation)); Surnin, A.G.; Mizyukanov, A.G. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

It is suggested that nodule corrosion on fuel claddings, process channel surfaces a fuel assembly surfaces is induced by a short circuit of an oxide film by intermetallic Zr compounds with impurities or doped-components or by their oxides with deposition of corrosion products of the NPP first circuits. In terms of the electrochemical corrosion model the equivalent electrical diagrams for nodule corrosion process in the stages of pre- and post-transition oxidation were suggested. The expressions defining nodule corrosion kinetics are obtained. The results of computer calculations of nodule corrosion as a function of operation conditions a running time are adduced. 4 refs.; 4 figs. (author).

26691 (INIS-mf–13547, pp. 151-157) **Second phase inclusion effect on the mechanism of irradiation nodula corrosion**

of the unswelling alloys. Karasev, V.S. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij); Kovyrshin, V.G.; Chirko, L.I.; Shinakov, A.A.; Tutnov, A.A.; Sergeeva, L.V. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

Radiation-induced nodular corrosion mechanism based on the metallographic and X-rays investigations of corrosion damage boiling water reactor canal tubes was suggested. According to this mechanism the swelling of the second phase inclusions (carbides, intermetallic particles) in the Zr-alloys unswelling matrix lead to local strains which accelerates corrosion under irradiation. Correlations between the sizes of second phase inclusion and plastic deformated zone necessary for the nodular formation were calculated. 14 refs.; 3 figs. (author).

26692 (INIS-mf–13547, pp. 158-164) **Study of crack initiation and propagation mechanism on SCC of Zr-1%Nb VVER fuels.** Novikov, V.V. (Vsesoyuznyj Nauchno-Issledovatel'skij Inst. Neorganicheskikh Materialov, Moscow (Russian Federation)); Sokurskij, Yu.M.; Bibilashvili, Yu.K. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

The paper presents the results of investigations into crack initiation on stress corrosion cracking (SCC) of Zr-1% Nb claddings. Iodine distribution has been studied at inner clad surfaces, points of crack initiation and crack surface. Intergranular iodine diffusion has been estimated. Consideration has been given to the mechanism of SCC. 4 refs.; 8 figs. (author).

26693 (INIS-mf–13547, pp. 112-117) **Structure and properties of the aluminium alloy SAW-1 after long-term reactor irradiation.** Karasev, V.S. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij); Zaritskij, N.S.; Mamchich, S.D. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

Mechanical tensile test data of the ring-shaped specimens and results of the aluminium alloy SAW-1 structure investigation after reactor irradiation at the temperature of 40-60^{0}C and fast neutron fluence nearly $3.6x10^{26}m^{-2}$ ($E \geq 0.8$ MeV) are presented. The irradiated material ultimate elongation is 2.5% at the room test temperature. Mg_2Si-phase positive influence on the alloy irradiation resistance is showed. 9 refs.; 1 fig.; 2 tabs. (author).

26694 (INIS-mf–13547, pp. 118-124) **Structural damages of metal hafnium during reactor irradiation.** Risovanyj, V.D. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (Russian Federation)); Klochkov, E.P.; Kosenkov, V.M.; Ostrovskij, Z.E. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

Neutron-physical, mechanical and chemical properties of hafnium let it to be widely used as an absorbing and constructional material in nuclear reactor control system. Research reactor and post-reactor tests were held to substantiate performance of control system. Some results of hafnium structure investigation after reactor irradiation were presented. 6 figs. (author).

26695 (INIS-mf–13547, pp. 165-171) **Resistance to destruction of zirconium tubes in technological channels with account of radiation creeping and delayed hydrogen failure.** Kiselev, V.A. (Nauchno-Issledovatel'skij i Konstruktorskij Inst. Ehnergotekhniki, Moscow (Russian Federation)); Rivkin, E.Yu.; Rodchenkov, B.S. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

Estimation of the strength and durability of technological channel tubes from zirconium alloys at high levels of stresses and temperatures with account of crack-type defects development kinetics. 2 figs.; 1 tab. (author).

26696 (INIS-mf–13547, pp. 172-176) **Investigation and prediction of cladding materials deformation behaviour under rapid heating.** Pirogov, E.N. (Moskovskij Inzhenerno-Fizicheskij Inst., Moscow (Russian Federation)); Ankudinov, A.V.; Komarov, O.V.; Artyukhina, L.L.; Egorov, V.I. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

The investigation results connected with prediction of cladding materials deformation behaviour under accident situations conditions are presented. The necessity of preliminary studying of material structural evolution on different temperature levels is underlined. For 0Kh16N15M3BP steel the dependence of plastic deformation from stress, temperature and heating rate is given. For Zr-1%Nb alloy the polymorphic transformation temperature intervals is defined for heating rate to 500 K/s. 4 refs.; 5 figs. (author).

26697 (INIS-mf–13547, pp. 177-184) **Efficiency of collisional precipitate resolution.** Wollenberger, H. (Hahn-Meitner-Institut Berlin GmbH (Germany)). AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

The morphology of a multi-phase structure under irradiation is determined by the counteraction of precipitate dissolution due to cascade mixing and re-precipitation due to freely migrating irradiation-induced point defects. A steady state boundary may occur when the precipitate volume change rates due to the two processes match each other. Such a boundary was observed for a Cu-Ni-Fe alloy. Consideration of the detection limit for precipitate dissolution focusses attention to the magnitude of the dissolution rate. A new method for determining dissolution rates by atom probe analysis is described. Measured data are compared with cascade mixing rates as determined in ion beam mixing experiments. 11 refs.; 3 figs. (author).

26698 (INIS-mf–13547, pp. 185-196) **Low activated chromium-base alloys.** Trefilov, V.I.; Zelenskij, V.F.; Neklyudov, A.N. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

Results on the investigation of radiation resistance of three groups of chromium alloys after accelerator irradiation and under reactor condition are presented. These alloys are suggested as low activated materials for fusion (low alloying - with chromium content more than 95%wt., high-alloying - with Cr content more than 50% wt. and alloys with Cr content between 27 and 45% wt.). High resistivity of chromium alloys to void swelling, radiation creep and high temperature radiation embrittlement are shown. Degree of radiation embrittlement depends on content of alloying elements and gas impurities. 14 refs.; 11 figs. (author).

26699 (INIS-mf–13547, pp. 132-143) **Study of swelling and radiation creeping in construction materials of fuel assembly wrappers at BN-350 reactor on results of their form changes.** Karaulov, V.N. (Mangyshlakskij Ehnergokombinat, g.Shevchenko (Russian Federation)); Shkol'nik, T.G. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

Vacancy swelling and radiation creeping (RC) of construction steels and alloys at BN-350 reactor according to data about the form change of fuel assembly wrappers which obtained high damaging doses was studied. For 12Kh18N10T MTO and O8Kh16N11M3 MTO steels a dependence of RC module on temperature was established. Swelling of these steels is described good by a power dependence on irradiation dose. 3 refs.; 9 figs.; 4 tabs. (author).

26700 (KAPL–4737) **The effect of processing on the microstructure and tensile properties of a γ-TiAl based alloy.** Fuchs, G.E. Knolls Atomic Power Lab., Schenectady, NY (United States). Feb 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC12-76SN00052. (CONF-920604–4: 7. world conference and exhibition on titanium, San Diego, CA (United States), 28 Jun - 2 jul 1992). Order Number DE93013221. Source: OSTI; NTIS; INIS; GPO Dep.

Compositional and microstructural control, and alloying additions have been the primary methods used to increase the low temperature ductility of TiAl-based alloys. However, very little has been done to characterize the effect of processing on ductile γ-TiAl alloys. This study examines effect of processing on microstructure and properties of cast, wrought and powder metallurgy TiAl-based alloys with a similar nominal composition. The alloy was Ti-48Al-2Nb-2Cr (at. %). After processing, all of the samples were heat treated in the $\alpha + \gamma$ phase field. Microstructures were characterized by optical, scanning electron and transmission electron microscopy. Tensile properties were evaluated in the temperature range 25–1000C in air. The powder processed alloys exhibited the highest strength and ductility at test temperatures up to 850C. All of the alloys exhibited similar tensile properties at 1000C. Examination of fracture surfaces indicated that tensile failure occurred by predominantly transgranular cleavage at temperatures below 700C. However, above 850C, significant plastic deformation was observed, particularly in the powder metallurgy samples. The interrelationships of processing-microstructure-mechanical properties of Ti-48Al-2Nb-2Cr (at. %) will be discussed.

26701 (LA-UR–93-669) **Metastable phases in mechanically alloyed aluminum germanium powders.** Yvon, P.J.; Schwarz, R.B. Los Alamos National Lab., NM (United States). [1993]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9309104–1: 2. structural applications of mechanical alloying conference, Vancouver (Canada), 20-22 Sep 1993). Order Number DE93008727. Source: OSTI; NTIS; GPO Dep.

Aluminum and germanium form a simple eutectic system with no stable intermetallic phase, and limited mutual solubility. We report the formation of a metastable rhombohedral,γ_1 phase by mechanically alloying aluminum and germanium powders. This phase, which appears for compositions between 20 and 50 at. % germanium, has also been observed in rapidly quenched alloys, but there is disagreement as to its composition. By measuring the heat of crystallization as a function of composition, we determined the composition of the γ_1 phase to be $Al_{70}Ge_{30}$. We also produced $Al_{70}Ge_{30}$ by arc melting the pure elements, followed by splat-quenching at a cooling rate in the range of 10^8 K s^{-1}. This method produced two metastable phases, one of which was found to be the γ_1 phase obtained by mechanical alloying. The other was a monoclinic phase reported earlier in the literature as γ_2.

26702 (LA-UR–93-712) **The effect of oxygen, grain size, and strain rate on the mechanical behavior of forged P/M tantalum.** Michaluk, C.A. (Cabot Corp., Boston, MA (United States)); Gray, G.T. III; Chatterjee, T. Lawrence Livermore National Lab., CA (United States). [1993]. 10p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9302111–1: Powder metallurgy in aerospace, defense, and demanding applications, San Diego, CA (United States), 8-11 Feb 1993). Order Number DE93011251. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The effect of oxygen, grain size, and strain rate on the quasistatic and dynamic mechanical properties of extruded, forged, and annealed P/M tantalum containing two different levels of oxygen is addressed. The high oxygen (250–400 ppM) P/M materials were characterized as having higher flow stress and greater work hardening than wrought high purity tantalum. Work hardening and relative strain rate sensitivity exponents of the P/M materials were found to be relatively independent of oxygen level and grain size and slightly dependent on strain rate. This behavior may be due to the existence of fine dispersion of tantalum oxide particles. The state of oxygen in the P/M forgings was investigated by TEM analysis.

26703 (LA-UR–93-1142) **Excimer laser surface processing of titanium.** Jervis, T.R.; Hubbard, K.M.; Zocco, T.G.; Foster, L.; Nastasi, M.; Tesmer, J.R. Los Alamos National Lab., NM (United States). [1993]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9302103–2: Annual meeting of the Minerals, Metals and Materials Society (TMS), Denver, CO (United States), 22 Feb 1993). Order Number DE93012633. Source: OSTI; NTIS; GPO Dep.

We have examined the effect of laser surface processing of Ti alloys using pulsed excimer laser light at 248 nm. Thermal transformations of the surface are accomplished by heating the surface and rapid cooling. Alloying and formation of compounds can be obtained by melting and mixing surface layers into the material and by gas alloying. Multiple melting-resolidification cycles result in the inter-diffusion of surface layers in the liquid state and the diffusion of gas species into the material. The effect of alloying from both solid and gas sources and the effects of thermal transformations on the microstructure and surface hardness properties of these alloys will be examined.

26704 (LA-UR–93-1150) **Ploughing on gold using a Scanning Tunneling Microscope.** Day, R.D. (Los Alamos National Lab., NM (United States)); Russell, P.E. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9304138–1: Principles of cutting mechanics, Tucson, AZ (United States), 13-15 Apr 1993). Order Number DE93012632. Source: OSTI; NTIS; GPO Dep.

Purpose of the our experiments is to measure the nominal force on the sample induced by the tip as a function of voltage and tunneling current and use the imaging capabilities of the STM to determine if the sample materials surface can be deformed plastically in a controlled manner by the tip in our investigations we use the tip as a ploughing tool which can be moved in a line to create a furrow, or can be scanned in a plane to displace a pocket of material. This abstract describes how we measure the tunneling force, presents some of the data acquired to date, and shows evidence of plastic deformation caused by the tip.

26705 (LA-UR–93-1201) **Mechanical properties of excimer laser modified titanium surfaces.** Jervis, T.R.; Zocco, T.G.; Hubbard, K.M.; Nastasi, M. Los Alamos National Lab., NM (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9304136–1: MRS symposium on thin films, stresses and mechanical properties, Pittsburgh, PA (United States), 12-16 Apr 1993). Order Number DE93012663. Source: OSTI; NTIS; GPO Dep.

Excimer laser processing enables both thermally-driven transformations and the incorporation of solutes into the surface of materials through melting and diffusional mixing. We have examined the effect of excimer laser processing on the microstructure and surface mechanical properties of titanium alloys. Changes in the surface hardness due to laser processing were studied using a Nanoindenter ™. Alloying experiments using both mixing of evaporated surface layers of boron and laser gas alloying in air and in nitrogen all result in changes in the surface hardness of the material. Alloying with boron results in an amorphous surface which is somewhat harder than the as polished surface. Laser processing in air and pure nitrogen results in incorporation of oxygen and nitrogen and the development of fine ($\sim$ 50 nm) precipitates of TiO and TiN respectively. Substantial increases in surface hardness result due to solution and precipitation mechanisms. The effects of alloying on the surface hardness of the materials will be discussed in terms of the concentration of the solute and microstructures observed.

26706 (LA-UR–93-1395) **Ternary alloying effects in polycrystalline β-NiAl.** Cotton, J.D. (Los Alamos National Lab., NM (United States)); Noebe, R.D.; Kaufman, M.J. Los Alamos National

Lab., NM (United States). [1993]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930997–1: International symposium on structural intermetallics, Champion, PA (United States), 26-30 Sep 1993). Order Number DE93012675. Source: OSTI; NTIS; GPO Dep.

Purpose of this paper is to summarize alloying research to date in polycrystalline NiAl and its impact on microstructure and ambient temperature properties. It is divided into the following sections: phase equilibria, solid solution effects and precipitation effects. Alloys that contain a high volume fraction of second phase (e.g. pseudobinary eutectic compositions) are not considered. Rather, the effects of dilute to moderate ternary alloying additions on the structure and properties of β-NiAl are reviewed. It is already well established that stoichiometry is paramount in controlling mechanical properties of the binary compound. Since the addition of a third element is equally important, ternary phase equilibria are reviewed first. Solid solution strengthening is probably the least well understood particularly with respect to the nature of point defects and their contribution to strength. Characterization of these defects and their role in mechanical properties may well hold the key to future development of NiAl-based materials. With regard to second phases, there is limited evidence that the classical precipitation hardening mechanisms for metals are also applicable to NiAl.

26707 (LA-UR–93-1785) **Shock compression and quasielastic release in tantalum.** Johnson, J.N.; Hixson, R.S.; Tonks, D.L.; Gray, G.T. III. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9306167–3: 14. international conference on high pressure science and technology and 1993 technical meeting of the topical group on shock compression of condensed matter, Colorado Springs, CO (United States), 28 Jun - 3 jul 1993). Order Number DE93014566. Source: OSTI; NTIS; GPO Dep.

Previous studies of quasielastic release in shock-loaded FCC metals have shown a strong influence of the defect state on the leading edge, or first observable arrival, of release wave, due to large density of pinned dislocation segments behind the shock front, their relatively large pinning separation, and a very short response time as determined by drag coefficient in shock-compressed state. This effect is entirely equivalent to problems associated with elastic moduli determination using ultrasonic methods. This is particularly true for FCC metals, which have an especially low Peierls stress, or inherent lattice resistance, that has little influence in pinning dislocation segments and inhibiting anelastic deformation. BCC metals, on the other hand, have a large Peierls stress that essentially holds dislocation segments in place at low net applied shear stresses and thus allows fully elastic deformation to occur in the complete absence of anelastic behavior. Shock-compression and release experiments have been performed on tantalum (BCC), with the observation that the leading release disturbance is indeed elastic. This conclusion is established by examination of experimental VISAR records taken at the tantalum/sapphire (window) interface in a symmetric-impact experiment which subjects the sample to a peak longitudinal stress of approximately 7.3 GPa, in comparison with characteristic code calculations.

26708 (LA-UR–93-2323) **Differential Sensitivity Theory applied to the MESA code for high pressure interactions.** Maudlin, P.J.; Henninger, R.J.; Harstad, E.N. Los Alamos National Lab., NM (United States). [1993]. 13p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9306167–5: 14. international conference on high pressure science and technology and 1993 technical meeting of the topical group on shock compression of condensed matter, Colorado Springs, CO (United States), 28 Jun - 3 jul 1993). Order Number DE93016460. Source: OSTI; NTIS; GPO Dep.

A technique called Differential Sensitivity Theory (DST) is applied to the system of equations solved by the MESA hydrocode. DST uses adjoint techniques to determine exact sensitivity derivatives, i.e., if R is a calculational result of interest (response R) and α_i is a calculational input (parameter α_i), then $\partial R/\partial\alpha_i$ is defined as the sensitivity. The advantage of using DST is that for an n-parameter problem all n sensitivities can be obtained by integrating the solutions from only two calculations, a MESA calculation and its corresponding adjoint calculation using an Adjoint Continuum Mechanics code (ACM). This work describes the derivation and solution of the appropriate set of adjoint and sensitivity equations for the purpose of computing sensitivities for high-rate two-dimensional, multi-component, high deformation problems. As an example, results are presented for a flyer plate problem.

26709 (LBL–33948) **Theory of the negative magnetoresistance in magnetic metallic multilayers.** Hood, R.Q. (California Univ., Berkeley, CA (United States). Dept. of Physics); Falicov, L.M. Lawrence Berkeley Lab., CA (United States). Apr 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930405–10: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93013912. Source: OSTI; NTIS; GPO Dep.

The Boltzman equation is solved for a system consisting of alternating ferromagnetic normal metallic layers. The in-plane conductance of the film is calculated for two configurations: successive ferromagnetic layers aligned parallel and antiparallel to each other. Results explain the giant negative magnetoresistance encountered in these systems when an initial antiparallel arrangement is changed into a parallel configuration by application of an extemal magnetic field. The calculation depends on geometric parameters (the thicknesses of the layers); intrinsic metal parameters (number of conduction electrons, magnetization and effective masses in the layers); bulk sample properties (conductivity relaxation times); and interface scattering properties (diffuse scattering versus potential scattering at the interfaces). It is found that a large negative magnetoresistance requires, in general, considerable asymmetry in the interface scattering for the two spin orienmtions. All qualitative features of the experiments are reproduced. Quantitative agreement can be achieved with sensible values of the parameters. The effect can be conceptually explained based on considerations of phase-space availability for an electron of a given spin orientation as it travels through the multilayer sample in the various configurations and traverses the interfaces.

26710 (LBL–34012) **Microstructural influences on the mechanical properties of solder.** Morris, J.W. Jr.; Goldstein, J.L.F.; Mei, Z. Lawrence Berkeley Lab., CA (United States). Apr 1993. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9209360–1: 3. international workshop on materials and mechanics issues of solder alloy applications, Santa Fe, NM (United States), 9-11 Sep 1992). Order Number DE93015044. Source: OSTI; NTIS; GPO Dep.

Intent of this book is to review analytic methods for predicting behavior of solder joints, based on continuum mechanics. The solder is treated as a continuous, homogeneous body, or composite of such bodies, whose mechanical behavior is uniform and governed by simple constitutive equations. The microstructure of a solder joint influences its mechanical properties in 3 ways: it governs deformation and failure; common solders deform inhomogeneously; and common solders are microstructurally unstable. The variety of microstructures often found in solder joints are briefly reviewed, and some of the ways are discussed in which the microstructure influences the common types of high-temperature mechanical behavior. 25 figs, 40 refs.

26711 (LBL–34028) **The low-temperature specific heat of $CeCu_2Ge_2$ at 0 and 9.5 kbar.** Fisher, R.A. (Lawrence Berkeley Lab., CA (United States)); Emerson, J.P.; Phillips, N.E.; Caspary, R.; Steglich, F. Lawrence Berkeley Lab., CA (United States). Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930801–4: Conference of the International Union of Pure and Applied Physics on low temperature physics (LT 20), Eugene, OR (United States), 1-11 Aug 1993). Order Number DE93014914. Source: OSTI; NTIS; GPO Dep.

$CeCu_2Ge_2$ orders antiferromagnetically, $T_N \sim 4K$, and $\gamma(T) \sim 200\ mJ/K^2 \cdot mole$ near 0.5K and P = 0. A pressure of 9.5 kbar has no measurable effect on T_N; reduces slightly the specific-heat anomaly at T_N; and reduces slightly $\gamma(T)$ below 0.7K. These effects of pressure are in striking contrast to the much stronger effects on other heavy-fermion compounds, e.g., $CeAl_3$, URu_2Si_2 and $CeCu_2Si_2$.

26712 (NEI-SE–120) **Corrosion of underground water pipes due to acidification of soil and groundwater.** Levlin, E. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Water Resources Engineering. Mar 1992. 28p. Order Number DE93500845. Source: OSTI; NTIS.

Paper no 2 to TRITA-TEK–92-01.

The anthropogenic acidification creates changes of soil and groundwater that may contribute to increased corrosion of water pipe systems, buried in the ground. Investigations on the influence of acidification on corrosion of underground water pipes are being performed, which include studies of damage frequency statistics and laboratory experiments. The purpose of this literature survey is to establish the state-of-the-art as background for these investigations. The soil chemistry and the changes caused by acidification, as well as the connection between soil properties and corrosion, are two topics which are essential for the understanding of the influence of acidification on the corrosion of metallic structures in the ground. As cast-iron is the material most used for underground water pipes, the corrosion mechanisms of cast-iron are important. Of interest are also reports on corrosion damages to water pipes in soil and on laboratory investigations on soil corrosion. Laboratory investigations make possible the separation of the factors contributing to corrosion and allow the magnitude of the acidification factor to be determined. (51 refs., 11 figs., 11 tabs.).

26713 (NUREG/CR–4744-Vol.7-No.1) **Long-term embrittlement of cast duplex stainless steels in LWR systems: Semiannual report, October 1991–March 1992: Volume 7, No.1.** Chopra, O.K. (Argonne National Lab., IL (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Argonne National Lab., IL (United States). May 1993. 165p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-31109-ENG-38. (ANL–92/42-Vol.7-No.1). Source: OSTI; NTIS; INIS; GPO.

This progress report summarizes work performed by Argonne National Laboratory on long-term thermal embrittlement of cast duplex stainless steels in LWR systems during the six months from October 1991 to March 1992. Charpy-impact, tensile, and fracture toughness J-R curve data are presented for several heats of cast stainless steel that were aged 10,000-58,000 h at 290, 320, and 350°C. The results indicate that thermal aging decreases the fracture toughness of cast stainless steels. In general, CF-3 steels are the least sensitive to thermal aging and CF-8M steels are the most sensitive. The values of fracture toughness J_{IC} and tearing modulus for CF-8M steels can be as low as $\approx$90 kJ/m^2 and $\approx$60, respectively. The fracture toughness data are consistent with the Charpy-impact results, i.e. unaged and aged steels that show low impact energy also exhibit lower fracture toughness. All steels reach a minimum saturation fracture toughness after thermal aging; the time to reach saturation depends on the aging temperature. The results also indicate that low-strength cast stainless steels are generally insensitive to thermal aging.

26714 (ORNL/NPR–92/65) **The corrosion behavior of 8001 Al under heat-transfer conditions in an aqueous loop system.** Pawel, R.E.; Felde, D.K.; McFee, M.T.; Clinard, J.A. Oak Ridge National Lab., TN (United States). Apr 1993. 135p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013450. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Specimens of 8001 aluminum were exposed to flowing water under heat-transfer conditions relevant to the proposed New Production Reactor-heavy-water reactor (NPR-HWR) in a Corrosion Test Loop System. The growth of oxide films on the reacting surfaces was characterized by temperature measurements on the specimen during the course of the experiments and by post-test examinations and analyses of the specimens. For all tests, the major reaction product was boehmite ($Al_2O_3 \cdot H_2O$) with, in many instances, a thin, iron-rich outer layer that formed as a consequence of aqueous mass transport from the cooler stainless steel sections of the loop. In a series of five tests, each up to eight weeks in duration, the measured film growth rates were shown to be sensitive to both thermal-hydraulic and chemical variables and were compared to the predictions of existing data correlations.

26715 (PNL-SA–22257) **Interfacial precipitation, segregation and deformation in alloy 600: Implications on primary-side IGSCC.** Bruemmer, S.M. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9304146–1: Alloy 600 experts meeting, Warrenton, VA (United States), 5-9 Apr 1993). Order Number DE93013161. Source: OSTI; NTIS; GPO Dep.

A great many unknowns still exist concerning the mechanisms controlling intergranular stress corrosion cracking (IGSCC) of alloy 600 in high-temperature, deaerated water environments. Any proposed mechanism must involve the microstructure, microchemistry and mechanical properties of grain boundary regions. To facilitate basic understanding, specific aspects of alloy 600 metallurgy are reviewed and discussed. Interfacial carbide precipitation, chromium depletion, impurity segregation and local deformation characteristics are examined and related to IGSCC behavior. Purpose of this paper is to provide information, and prompt discussion, on these various issues for the EPRI Alloy 600 Experts Meeting.

26716 (SAND–92-2508C) **Effects of growth conditions and substrate orientation on the properties of InSb.** Biefeld, R.M.; Baucom, K.C. Sandia National Labs., Albuquerque, NM (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930405–7: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93013766. Source: OSTI; NTIS; GPO Dep.

Two new organometallic Sb sources, tris(dimethylamino)antimony (TDMASb), and tertiarybutyldimethylantimony (TBDMSb) are being investigated. Growth of InSb using TDMASb, or TBDMSb and TMIn was investigated at 350 to 475C using a range of V/III ratios, growth rates and pressures. Misoriented InSb substrates were also used for selected growth conditions. The growth rates of InSb using TMIn and either TDMASb or TBDMSb at temperatures $\leq$ 425C were proportional to both the TMIn flow rate and the temperature. The surface morphology of InSb grown using either TDMASb or TBDMSb was very rough for growth temperatures $\leq$ 425C. This may be due to the complex decomposition mechanisms involved and the presence of methyl groups on the surface. Smoother backgrounds were generally found when using off axis substrates. The details of the defects observed on the surfaces were dependent on the type of misorientation and can be related to the atomic structure of the surface steps. Both n- and p-type InSb were grown using TBDMSb or TDMASb and TMIn with mobilities up to 68,990 and 7773 cm^2/Vs, respectively, at 77 K. The mobility for InSb using either TDMASb or TBDMSb was optimized by going to lower temperatures, pressures and V/III ratios. The opposite was true for surface morphology which improved with higher temperature, pressure, and V/III ratio. The growth of high mobility InSb with smooth surfaces at T $\leq$ 425C was not achieved with TDMASb or TBDMSb and TMIn under the conditions investigated in this work.

26717 (SAND–93-0027) **Multiphase equation of state for iron.** Kerley, G.I. Sandia National Labs., Albuquerque, NM (United States). Feb 1993. 64p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013956. Source: OSTI; NTIS; GPO Dep.

The PANDA code is used to build a multiphase equation of state (EOS) table for iron. Separate EOS tables were first constructed for each of the individual phases. The phase diagram and multiphase EOS were then determined from the Helmholtz free energies. The model includes four solid phases (α,γ, δ, and ϵ) and a fluid phase (including the liquid, vapor, and supercritical regions). The model gives good agreement with experimental thermophysical data, static compression data, phase boundaries, and shock-wave measurements. Contributions from thermal electronic excitation, computed from a quantum-statistical-mechanical model, were found to be very important. This EOS covers a wide range of densities (0–1000 g/cm^3) and temperatures (0–1.2$\times$10^7 K). It is also applicable to RHA steel. The new EOS is used in hydrocode simulations of plate impact experiments, a nylon ball impact on steel, and the shaped charge perforation of an RHA plate. The new EOS table can be accessed through the SNL-SESAME library as material number 2150.

26718 (SAND–93-1013C) **Microstructural mechanisms that enhance electromigration resistance in Al–Cu thin films.** Frear, D.R.; Michael, J.R. Sandia National Labs., Albuquerque, NM (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930405–8: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93013770. Source: OSTI; NTIS; GPO Dep.

Evolution of the microstructure of Al-2wt.%Cu thin films is examined with respect to how the presence of copper can influence electromigration behavior. After an anneal that simulates a thin film sintering step, the microstructure of the Al-Cu films consisted of 1 μm aluminum grains with θ-phase Al_2Cu precipitates at grain boundaries and triple points. The grain size and precipitation distribution did not change with subsequent heat treatments. Upon cooling to room temperature the heat treatment of the films near the Al/Al+θ solvus temperature results in depletion of copper at the aluminum grain boundaries. Heat treatments lower in the two phase region (200 to 300C) result in enrichment of copper at the aluminum grain boundaries. Here, it is proposed that electromigration behavior of aluminum is improved by adding copper because the copper enrichment in the form of Al_2Cu phase may hinder aluminum diffusion along the grain boundaries.

26719 (SVF–462) **The effect of chlorine on CFB furnace wall tubes.** Haeggblom, E. (Studsvik Material AB, Nykoeping (Sweden)). Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden); Studsvik Material AB, Nykoeping (Sweden). 1992. 31p. (In Swedish). (STUDSVIK-M–92-93). Order Number DE93500702. Source: OSTI; NTIS.

The aim of this work was to assess if chlorine in the combustion gas in a circulating fluidised bed (CFB) influences the erosion-corrosion properties of the furnace wall tubes. Specimens of carbon steel, stainless steel and a nickel base alloy have been subject to simultaneous erosion and corrosion at high temperature in the laboratory. Hydrogen chloride was injected into the gas atmosphere. Hydrogen chloride, in concentrations corresponding to those in waste incinerator untreated flue gas, affects the corrosion rates of carbon steel considerably. If the metal temperature is high enough, the metal wastage may reach unacceptable levels. Oxide scales formed are porous and contain high amounts of iron chloride. The scales have low resistance to particle erosion. The high alloyed materials were only slightly attacked in this experiment. (15 figs., 3 tabs.).

26720 (TRITA-TEK–92-01) **Corrosion of water pipe systems due to acidification of soil and groundwater.** Levlin, E. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Applied Electrochemistry and Corrosion Science. 1992. 30p. Order Number DE93500842. Source: OSTI; NTIS.

The influence of acidification on the external corrosion of pipes buried in the soil, was studied in a damage frequency analysis, but no connection was found. The corrosion in soil appears to be mainly dependent on other factors than acidification, such as the type of soil. With respect to the position of the pipe in the soil three cases can be distinguished: (i) Pipes in aerobic soil high above the groundwater level suffer from corrosion due to rich oxygen supply. The corrosion is, however, gradually stifled by precipitation of iron oxides. (ii) Pipes in anaerobic soil below the groundwater level may corrode due to the absence of protective corrosion products. However, depending on the H_2S/Fe^{2+}-ratio a protective layer of FeS may precipitate. (iii) On pipes just above the groundwater level corrosion by the action of aeration cells may occur due to good oxygen supply combined with a fairly low resistivity. Laboratory experiments simulating aeration cell corrosion were carried out with two parallel cells, of which one was sprayed with acidified and the other with non-acidified water. In another investigation the geographical distribution of corrosion induced water damages was compared with the distribution of acidification effects, and a significant correlation was observed. Due to changes in the supply water quality, primarily the pH value, the alkalinity and the sulphate content, the acidification of the groundwater may lead to increased internal corrosion of water pipe installations in buildings. (30 refs., 8 figs.).

26721 (TRITA-VAT–3884) **Corrosion of underground water pipes due to acidification by air pollution - Damage frequency analysis.** Levlin, E. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Water Resources Engineering. Dec 1991. 16 p.p. Order Number DE93500848. Source: OSTI; NTIS.

Paper no 3 to TRITA-TEK–92-01.

The purpose of this investigation is to study how the corrosion of underground water pipes is influenced by acidification generated due to anthropogenic air pollution and the subsequent precipitation which affects the chemical properties of soil and the ground water. This investigation is based on 39 reported corrosion damages to municipal water conduits from eight municipalities in different parts of Sweden. The chosen municipalities are: Ale, Gothenburg, Helsingborg, Ljungby, Piteaa, Timraa, Stockholm and Vaexjoe. In order to assess the natural corrosivity of the soil and the influence of acidification on it, soil samples were collected from the respective damage sites and analysed. No direct relation between the pH-level and the corrosion damage frequency could be established. The reason may be that the corrosion damages on water pipes, especially corrosion caused by differential aeration, are more frequent in clay than in silt soil. Since clay has the property to weather more easily, it is more resistant to acidification, and has a lower resisitivity, larger ionic strength and higher pH-value. Some relations between sulphate content, total sulphur concentration and life span, however, have been noticed indicating that the corrosion increases with accelerating acidity. In order to reach a definite and more precise conclusion, a larger study involving a large number of corrosion damages would have been required. (8 refs., 8 figs., 2 tabs.).

26722 (TRITA-VAT–4912) **Corrosion of cast-iron in soil.** Levlin, E. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Water Resources Engineering. Dec 1991. 11 p.p. Order Number DE93500851. Source: OSTI; NTIS.

Paper no 6 to TRITA-TEK–92-01.

According to one theory corrosion of cast iron in anaerobic soil is caused by differential aeration cells and according to another theory, corrosion is caused by sulphate reducing bacteria. The ratio between H_2S and Fe^{2+}-ratio, is playing an important role in determining whether there will be corrosion on cast-iron in anaerobic soil. In anaerobic soil the stability of FeS is much higher than the stability of oxidic corrosion products. At high H_2S concentrations in the soil, precipitation of a protective film of FeS can occur on the iron surface. However, a high Fe^{2+} concentration in the soil will create a low H_2S concentration due to precipitation of FeS in the bulk of the soil and no FeS will be deposited on the iron surface. A differential aeration cell is created when one part of a construction is exposed to soil with a high content of oxygen, while another part is exposed to soil with a low oxygen content and as a consequence becoming anode and corroding. The dissolution of Fe^{2+} at the anode surfaces increases and the H_2S/Fe^{2+}-ratio becomes small and as a consequence uniform corrosion will occur. Sulphate reducing bacteria increase the H_2S/Fe^{2+}-ratio by producing H_2S through simultaneous oxidation of organic matter in the soil, and thereby promote passivation of the iron surface by the formation of a FeS coating. Local variations in the H_2S/Fe^{2+}- ratio may create a porous film, resulting in pitting corrosion. (13 refs., 6 figs.).

26723 (UCRL-JC–107859) **Large spatial, temporal, and algorithmic adaptivity for implicit nonlinear finite element analysis.** Engelmann, B.E.; Whirley, R.G. Lawrence Livermore National Lab., CA (United States). 30 Jul 1992. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921110–51: Winter annual meeting of the American Society of Mechanical Engineers (ASME), Anaheim, CA (United States), 8-13 Nov 1992). Order Number DE93016438. Source: OSTI; NTIS; GPO Dep.

The development of effective solution strategies to solve the global nonlinear equations which arise in implicit finite element analysis has been the subject of much research in recent years. Robust algorithms are needed to handle the complex nonlinearities that arise in many implicit finite element applications such as metalforming process simulation. The authors experience indicates that robustness can best be achieved through adaptive solution strategies. In the course of their research, this adaptivity and flexibility

has been refined into a production tool through the development of a solution control language called ISLAND. This paper discusses aspects of adaptive solution strategies including iterative procedures to solve the global equations and remeshing techniques to extend the domain of Lagrangian methods. Examples using the newly developed ISLAND language are presented to illustrate the advantages of embedding temporal, algorithmic, and spatial adaptivity in a modern implicit nonlinear finite element analysis code.

26724 (UCRL-JC–109359-Rev.1) **Ion assisted sputter deposition of Mo-Si multilayers: Revision 1.** Vernon, S.P. (Vernon Applied Physics, Torrance, CA (United States)); Stearns, D.G.; Rosen, R.S. Lawrence Livermore National Lab., CA (United States). Nov 1992. 20p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. Contract L1228. (CONF-9204120–9-Rev.1: Soft-x-ray projection lithography topical meeting, Monterey, CA (United States), 6-8 Apr 1992). Order Number DE93013830. Source: OSTI; NTIS; GPO Dep.

X-ray multilayer (ML) structures fabricated utilizing magnetron sputter deposition exhibit a degradation instructural quality with increased deposition pressure. The observed change in morphology is attributed to a reduced mobility of surface adatoms which inhibits the formation of smooth, continuous layers. The application of a negative substrate bias produces ion bombardment of the growing film surface by sputtering gas ions extracted from the plasma and allows direct control of the energy density supplied to the film surface during thin film growth. The technique supplements the energy lost to thermalization in high pressure deposition and permits the fabrication of high quality ML structures at elevated processing pressures. A three fold improvement in the soft x-ray normal incidence reflectance (NIR) at 130 Å results for substrate bias voltages of order ~ -150V for Mo-Si MLs deposited at 10 mTorr Ar.

26725 (UCRL-JC–109651) **Grain-boundary electronic states by multiple-scattering theory.** Sowa, E.C.; Gonis, A. Lawrence Livermore National Lab., CA (United States). Aug 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920927–4: 2. international conference and exhibition on computer applications to materials and molecular science and engineering, Yokohama (Japan), 22-25 Sep 1992). Order Number DE93013198. Source: OSTI; NTIS; GPO Dep.

In order to calculate the electronic structure of grain boundaries, it is necessary to treat properly the lack of translational symmetry in directions perpendicular to the interface between two half solids. This treatment can be provided on the basis of multiple-scattering theory. We have developed a formalism which allows the exact treatment of the Schroedinger equation for systems with reduced translational symmetry, yielding solutions which in the converged limit satisfy the proper boundary conditions imposed by the geometry of the system. We report the first application of this real-space multiple-scattering theory to the calculation of the local density of states (DOS) at metallic grain boundaries. We exhibit and compare local DOS's at selected sites for both unrelaxed and relaxed Σ5 (100) 36° twist and Σ5 (310) tilt grain boundaries in Cu, where the atomic coordinates of the relaxed configurations were obtained with the Embedded Atom Method. We discuss briefly the main features of our method, and give our plans for future work.

26726 (UCRL-JC–109917) **Interstitial embrittlement in vanadium laser welds.** Strum, M.J.; Wagner, L.M. Lawrence Livermore National Lab., CA (United States). 24 Feb 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-911296–10: 14. international conference on laser and applications, San Diego, CA (United States), 8-13 Dec 1991). Order Number DE93012588. Source: OSTI; NTIS; GPO Dep.

Efficiencies of interstitial absorption during pulsed ND:YAG laser welding of vanadium were compared for nitrogen, oxygen, hydrogen, and water vapor. Influence of interstitial levels on the embrittlement of vanadium laser welds was also measured. For 1000 ppM contaminant levels in the weld atmosphere, weld hydrogen content increased 9 ppM, nitrogen content increased 190 ppM, and oxygen content increased from 500 ppM relative to baseplate levels. Welds in ultrahigh-purity argon atmospheres contained 3 ppM hydrogen, 40 ppM nitrogen, and 250 ppM oxygen. Longitudinal all-weld tensile specimens and notched-plate specimens were used to measure weld metal tensile properties at −55C. All of the laser weld notch-strength ratios exceeded unity and weld metal tensile strengths all exceeded the baseplate values. For 1000 ppM atmosphere contaminant levels, the only significant decrease in ductility, as measured by reduction-in-area at fracture was for the weld atmosphere containing oxygen. Weld atmospheres containing 1% nitrogen also reduced the weld ductility, and resulted in the onset of cleavage fracture.

26727 (UCRL-JC–110128) **Modeling microstructural evolution and the mechanical response of superplastic materials.** Lesuer, D.R.; Syn, C.K.; Cadwell, K.L.; Preuss, C.S. Lawrence Livermore National Lab., CA (United States). 11 Jan 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921109–5: Fall meeting of the Metallurgical Society and American Institute of Metallurgical and Petroleum Engineers, Chicago, IL (United States), 1-5 Nov 1992). Order Number DE93014417. Source: OSTI; NTIS; GPO Dep.

A model has been developed that accounts for grain growth during, superplastic flow and its subsequent influence on stress-strain-strain rate behavior. These studies are experimentally based and have involved two different types of superplastic materials – a quasi-single phase metal (Coronze 638) and a microduplex metal (ultrahigh-carbon steel - UHCS). In both materials the kinetics of strain-enhanced grain growth have been studied as a function of strain, strain rate and temperature. An equation for the rate of grain growth has been developed that incorporates the influence of temperature. The evolution of the grain size distribution during superplastic deformation has also been investigated. Our model integrates grain growth laws derived from these studies with two mechanism based, rate dependent constitutive laws to predict the stress-strainstrain rate behavior of materials during superplastic deformation. The influence of crain size distribution and its evolution with strain and strain rate on the stress-strain-strain rate behavior has been represented through the use of distributed parameters. The model can capture the stress-strain-strain rate behavior over a wide range of strains and strain rates with a single set of parameters. Many subtle features of the mechanical response of these materials can be adequately predicted.

26728 (UCRL-JC–110669) **Laser weld repair of tantalum sheet.** Oldani, J.J.; Westrich, C.N. Lawrence Livermore National Lab., CA (United States). Dec 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921256–4: 1992 international conference on lasers, Houston, TX (United States), 7-11 Dec 1992). Order Number DE93016417. Source: OSTI; NTIS; GPO Dep.

Tantalum sheets which are used in radiographic film cassettes for high explosives studies were repaired using Nd:YAG laser welding. The tantalum sheets can receive various levels of indentations and/or scratches which can leave radiographic indications during use in subsequent studies. Laser welding using a Raytheon 400 watt Nd:YAG laser and a 0.010 inch diameter tantalum filler wire with argon cover gas was used to fill in these false indications. A successful weld repair is required to give no radiographic indications, neither high nor low density readings.

26729 (UCRL-JC–110687) **Effect of pressure on order and stability in alloys: The case of Al-Ge.** Turchi, P.E.A. (Lawrence Livermore National Lab., CA (United States)); Sluiter, M.; Stocks, G.M. Lawrence Livermore National Lab., CA (United States). 1 Dec 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;AC05-84OR21400. (CONF-921101–115: 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting, Boston, MA (United States), 30 Nov - 5 dec 1992). Order Number DE93013842. Source: OSTI; NTIS; GPO Dep.

A parameter-free approach to phase stability in substitutional alloys is applied to the influence of pressure on order-disorder phenomena in Al-Ge. The methodology is based upon an application of the Generalized Perturbation Method to the Korringa-Kohn-Rostoker scattering formulation of the Coherent Potential Approximation. For fcc-based Al-Ge alloys, it is shown that the tendency towards phase separation at normal pressure originates from a structural difference between the pure species. By applying

pressure, the structural energy difference is reduced, and a significant increase in the tendency towards order, especially for Al-rich alloys, is theoretically observed, leading, as an example, to the possible observation of a DO_{22} ordered state around 25 at. %. The electronic origin of the ordering tendencies induced by pressure is discussed and the theoretical predictions are related to experimental facts.

26730 (UCRL-JC–111000) **Electronic structure and phase stability properties in ternary substitutional alloys.** Traiber, A.J.S. (Lawrence Livermore National Lab., CA (United States)); Sluiter, M.; Turchi, P.E.A.; Allen, S.M. Lawrence Livermore National Lab., CA (United States). 1 Dec 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921101–122: 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting, Boston, MA (United States), 30 Nov - 5 dec 1992). Order Number DE93013848. Source: OSTI; NTIS; GPO Dep.

Electronic structure and stability properties of ternary-metal alloys are examined using an extension of the Coherent Potential Approximation -Generalized Perturbation Method approach within the Tight-Binding description of the chemically random alloy. In particular, we report on calculations of density of states, mixing energies and effective cluster interactions which build up the ordering energy. The study focuses on the Ti-V-Fe system and its binary components.

26731 (UCRL-JC–111304) **Quantitative HREM study of the atomic structure of the Σ(310)/[001] symmetric tilt grain boundary in Nb.** King, W.E.; Campbell, G.H. Lawrence Livermore National Lab., CA (United States). Nov 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921101–121: 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting, Boston, MA (United States), 30 Nov - 5 dec 1992). Order Number DE93013834. Source: OSTI; NTIS; GPO Dep.

We have used a non-linear least squares optimization method to deduce a model for the atomic structure of the Σ(310)/[001] symmetric tilt grain boundary in Nb from high resolution electron micrographs (HREM) of a bicrystal prepared by diffusion bonding. The resultant model is similar to, but differs in detail from a theoretical prediction based on interatomic potentials which included angular forces thought to be important in the prediction of defect structures in body centered cubic metals. Results validate this approach as a step toward making HREM quantitative technique.

26732 (UCRL-JC–111973) **X-ray dichroism experiments using circular polarization.** Tobin, J.G. (Lawrence Livermore National Lab., CA (United States)); Waddill, G.D.; Sterne, P.A.; Gouder, T.; Jankowski, A.; Pappas, D.P.; Webb, D.J. Lawrence Livermore National Lab., CA (United States). Aug 1992. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9208225–1: Advanced light source users meeting, Berkeley, CA (United States), 27-28 Aug 1992). Order Number DE93013195. Source: OSTI; NTIS; GPO Dep.

We report giant circular dichroism in the near-edge core-level x-ray absorption of a near-monolayer metal film. We have performed magnetic circular dichroism experiments on Fe/Cu(001), using both core-level photoemission and near-edge absorption fine structure, as well as photoemission of the exchange split 3s states. Coverage and temperature dependences were investigated. A simple, one electron picture supported by supercell calculations has worked well to explain normalized branching ratio measurements.

26733 (UCRL-JC–112067) **Atomic structure of the (310) twin in niobium: Theoretical predictions and comparison with experimental observation.** Campbell, G.H. (Lawrence Livermore National Lab., CA (United States)); King, W.E.; Foiles, S.M.; Ruehle, M. Lawrence Livermore National Lab., CA (United States). Nov 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921101–120: 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting, Boston, MA (United States), 30 Nov - 5 dec 1992). Order Number DE93013421. Source: OSTI; NTIS; GPO Dep.

High-resolution transmission electron microscopy (HREM) has been used to characterize the atomic structure of the symmetric 36.9° tilt grain boundary with [001] tilt axes forming a twin about (310) in Nb. The projected structure was imaged along two different directions in the plane of the boundary and was compared to model structures through high-resolution image simulation. The atomic structure of this Σ-5 boundary was predicted with atomistic simulations using interatomic potentials derived from the Embedded Atom Method (EAM), Finnis-Sinclair (FS), and the Model Generalized Pseudopotential Theory (MGPT). The EAM and FS predicted structures with translations of the adjacent crystals which break mirror symmetry. The MGPT predicted one stable structure with mirror symmetry. The atomic structure of the (310) twin in Nb was found by HREM to be mirror symmetric. These findings indicate that the angular dependent interactions modeled in the MGPT are important for determining the grain boundary structures of bcc transition metals.

26734 (WHC-SA–1361) **BAKEOUT: A computer program for predicting diffusive outgassing from stainless steel.** Weis, M.P. Westinghouse Hanford Co., Richland, WA (United States). Dec 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930702–24: Pressure vessels and piping conference, Denver, CO (United States), 25-29 Jul 1993). Order Number DE93012613. Source: OSTI; NTIS; GPO Dep.

The outgassing load from a leak-tight and well-baked vacuum vessel is frequently dominated by the diffusive outgassing of hydrogen gas from the materials of which the vessel is constructed. Stainless steel, in particular, can be a major source of hydrogen. The diffusive transport of gas through materials is governed by the second order partial differential equation, $D\ \partial^2C/\partial X^2 = \partial C/\partial t$, known as Fick's Law. Two alternate solutions to this equation give exact numerical answers of the diffusive outgassing rate versus time. A simplified approximation of each solution allows prediction of both the short-term and the long-term behavior. BAKEOUT, a computer program based on Fick's Law, was developed to predict an elevated temperature step function of time (that is, a bakeout) that will achieve a desired hydrogen diffusive outgassing rate from a stainless steel vessel under vacuum. This paper presents the mathematical development of the computer program and an example case.

26735 (ANL/MCT/CP–77789) **Weibull analysis applied to the pull adhesion test and fracture of a metal-ceramic interface.** Erck, R.A. (Argonne National Lab., IL (United States). Materials and Components Technology Div.); Nichols, F.A.; Schult, D.L. Argonne National Lab., IL (United States). Materials and Components Technology Div. Nov 1992. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9304133–1: Annual conference and exhibition of the Society of Tribologists and Lubrication Engineers, Calgary (Canada), 17-20 Apr 1993). Order Number DE93012913. Source: OSTI; NTIS; GPO Dep.

Various adhesion tests have been developed to measure the mechanical bonding of thin coatings deposited on substrates. In the pull test, pins that have been bonded to the coating under test are pulled with increasing force normal to the coating until the coating is pulled from the substrate. For many systems, large scatter in the data is often observed due to uncontrolled defects in the interface and the brittle nature of the pull test. In this study, the applicability of Weibull statistics to the analysis of adhesion of Ag films to vacuum sputter-cleaned zirconia was examined. Data were obtained for smooth and rough substrates for various levels of adhesion. A good fit of the data to the Weibull distribution was observed. The Weibull modulus was found to depend on the roughness of the substrate, but was insensitive to the adhesion strength.

26736 (ANL/MSD/CP–79578) **Roles of oxygen defects in copper-oxide superconductors.** Jorgensen, J.D.; Radaelli, P.G.;

Shaked, H.; Wagner, J.L.; Hunter, B.A.; Mitchell, J.F.; Litterman, R.L.; Hinks, D.G. Argonne National Lab., IL (United States). Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-31109-ENG-38. Grant DMR-91-20000. (CONF-930682–1: International workshop on superconductivity, Hokkaido (Japan), 28 Jun - 1 jul 1993). Order Number DE93014875. Source: OSTI; NTIS; INIS; GPO Dep.

Oxygen vacancy and interstitial defects can have a profound effect on the superconducting compounds. Recent work on compounds such as La_2CuO_{4+x} new insight into the role of interstitial oxygen defects as a doping mechanism. Studies of $(La,Sr,Ca)_3Cu_2O_{6+x}$ with various metal compositions and metal-site ordering show that interstitial oxygen defects that form between the CuO_2 layers in this structure systematically lower T_c and eventually destroy superconductivity. However, oxygen vacancies in the CuO_2 planes have surprisingly little effect at concentrations below 3%. The infinite-layer compounds, $ACuO_2$ where A=La, Sr, Ca, Nd, etc., in solid-solution combinations, offer a very environment for the formation of interstitial oxygen defects between the CuO_2 planes. However, neutron diffraction experiments on $Sr_{0.9}La_{0.1}CuO_2$ (T_c=42K) have not found any interstitial oxygen.

26737 (CEA-R–5621) **Effect of additives on enhanced sintering and grain growth in uranium dioxide.** Bourgeois, L. CEA Centre d'Etudes de Grenoble, 38 (France). Dept. de Thermohydraulique et de Physique; Institut National Polytechnique, 38 - Grenoble (France). Jun 1992. [144p.] (In French). Order Number DE93630460. Source: OSTI; NTIS (US Sales Only); INIS.

The use of sintering additives has been the most effective way of promoting grain growth of uranium dioxide. We have established a same mechanism for additives which belongs to corundum structure: chromium, aluminium, vanadium and titanium sesquioxides. Study of thermodynamical stabilities of dopants has lead to define suitable sintering atmospheres in order to enhance grain growth. Low solubility limits have been defined at T=1700 deg C for four additives, from variations of final grain size versus initial dopant concentration Identification of second phase after cooling has been done from electronic diffraction patterns. It appears that these solubilities decrease sharply as positive deviation from stoichiometry of uranium dioxide increases. Dilatometric analysis of sintering of doped uranium dioxide has shown in certain cases some enhancement in densification rates, at the point of onset of abnormal grain growth, which is believed to be the source. Nevertheless, the following growth is accompanied with pores coalescence mechanisms and pores entrapment inside grains. Increased thermal stability, during standard annealing, is expected, limiting thereby redensification of nuclear fuel in reactors. Finally, from investigations of additives vaporizations, Al_2O_3 and Cr_2O_3, oxygen exchanges between additives and matrix are believed to occur, which should lead to enhance pore mobility. (Author)., refs., figs., tabs.

26738 (CONF-9208207–2) **Chemical vapor deposition of Ta_2O_5 corrosion resistant coatings.** Graham, D.W.; Stinton, D.P. Oak Ridge National Lab., TN (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1992 coatings for advanced heat engines workshop; Monterey, CA (United States); 2 Aug 1992. Order Number DE93015488. Source: OSTI; NTIS; GPO Dep.

Silicon carbide and silicon nitride heat engine components are susceptible to hot corrosion by molten Na_2SO_4 which forms from impurities present in fuel and the environment. Chemically vapor deposited Ta_2O_5 coatings are being developed as a means to protect components from reaction with these salts and preserve their structural properties. Investigations to optimize the structure of the coating have revealed that the deposition conditions dramatically affect the coating morphology. Coatings deposited at high temperatures are typically columnar in structure; high concentrations of the reactant gases produce oxide powders on the substrate surface. Ta_2O_5 deposited at low temperatures consists of grains that are finer and have significantly less porosity than that formed at high temperatures. Samples of coatings which have been produced by CVD have successfully completed preliminary testing for resistance to corrosion by Na_2SO_4.

26739 (CONF-921101–123) **Fast-ICCD photography and gated photon counting measurements of blackbody emission from particulates generated in the KrF-laser ablation of BN and YBCO.** Geohegan, D.B. Oak Ridge National Lab., TN (United States). Nov 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting; Boston, MA (United States); 30 Nov - 5 dec 1992. Order Number DE93015491. Source: OSTI; NTIS; GPO Dep.

Fast intensified CCD photography and gated photon counting following KrF-laser irradiation of YBCO and BN targets reveals the first observations of very weak emission from slow-moving ejecta up to 2 cm from the target and times extending to ≈1.5 ms. Time-of-flight velocities inferred from the emission measurements indicate velocities ($v \sim (0.45–1.2) \times 10^4$ cm s^{-1}) comparable to those measured for the large particles which often accompany the pulsed laser deposition process. Gated photon counting is employed to obtain temporally resolved spectra of this weak emission. The spectral shape is characteristic of blackbody emission, which shifts to longer wavelengths as the particles cool during flight in vacuum. Estimates of the temperature of the particles are made based on the emissivity of a perfect blackbody and range from 2200 K to 3200 K for both BN and YBCO when irradiated at (Φ_{248} = 3.5 J cm^{-2} and 1.5 J cm^{-2}, respectively. The temperature decrease of the particles in vacuum is compared to a radiative cooling model which gives estimates of the initial surface temperature and radii of the particles.

26740 (CONF-921101–126) **Thin Ni silicide formation by low temperature-induced metal atom reaction with ion implanted amorphous silicon.** Erokhin, Yu.N. (North Carolina State Univ., Raleigh, NC (United States). Dept. of Materials Science and Engineering); Pramanick, S.; Hong, F.; Rozgonyi, G.A.; Patnaik, B.K. Oak Ridge National Lab., TN (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting; Boston, MA (United States); 30 Nov - 5 dec 1992. Order Number DE93015449. Source: OSTI; NTIS; INIS; GPO Dep.

We have extended our recent work on buried silicide formation by Ni diffusion into a buried amorphous silicon layer to the case where silicide formation is at lower temperatures on silicon substrates which have been preamorphized. The reaction of metal atoms from a 12 nm Ni film evaporated on top of a 65 nm thick surface amorphous layer formed by 35 keV Si^+ ion implantation has been investigated at temperature $\leq$400C. Rutherford Backscattering Spectrometry (RBS) with channeling, cross-sectional transmission electron microscopy (XTEM), x-ray diffraction and four-point-probe measurements were used to determine structure, interfacial morphology, composition and resistivity of the silicide films. It has been found that an increased rate of silicidation occurs for amorphous silicon with respect to crystalline areas permitting a selective control of the silicon area to be contacted during silicide growth. Vacuum furnace annealing at 360C for 8 hours followed by an additional step at 400C for one hour produces a continuos $NiSi_2$ layer with a resistivity 44 $\mu\Omega$ cm.

26741 (CONF-921101–129) **Kinetics of photodeposition of superconducting films.** Chen, C.H. (Oak Ridge National Lab., TN (United States)); Phillips, R.C.; Morrison, P.W. Oak Ridge National Lab., TN (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting; Boston, MA (United States); 30 Nov - 5 dec 1992. Order Number DE93015511. Source: OSTI; NTIS; GPO Dep.

It is critical to understand the kinetics of photodeposition of metal-oxide superconducting films. The monitoring of surface conditions of superconducting films on substrates was primarily obtained by FTIR. Desorbed ions and neutral atoms are the primary species producing the films during the laser ablation process, and mass spectroscopy is effective for determining the desorbed species. Although efforts have been made to learn the process, no

complete models have been arrived at. In general, the production of superconducting films is primarily due to deposition of neutral atoms and metal oxide molecules. 10 figs, 6 refs, 1 tab.

26742 (CONF-921101–131) **The influence of microstructure on the mechanical behavior of silicon nitride ceramics.** Becher, P.F. (Oak Ridge National Lab., TN (United States)); Lin, H.T.; Hwang, S.L.; Hoffmann, M.J.; Chen, I-Wei. Oak Ridge National Lab., TN (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States); German Federal Ministry of Science and Technology (Germany). DOE Contract AC05-84OR21400. Grant AF0SR-91-0094;Grant 03M2012. From 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting; Boston, MA (United States); 30 Nov - 5 dec 1992. Order Number DE93015363. Source: OSTI; NTIS; GPO Dep.

Elongated Si nitride grains produced during densification in a liquid phase can increase the fracture toughness, but this depends on the activation of intergranular rather than transgranular fracture. Bridging in the crack wake by elongated grains and pullout of some of these grains suggest that the crack wake mechanisms that contribute to toughening of whisker-reinforced ceramics can also operate in Si nitrides containing elongated grains. With diameters of the larger elongated grains approaching 9 μm, strengths > 800 MPa have been achieved along with Weibull moduli, but clustering of these larger elongated grains must be avoided. Fatigue of these toughened Si nitrides is influenced by silicate grain boundary phases. Design of toughened Si nitrides must consider effects of silicate phase composition and content on fatigue and creep. 8 figs, 18 refs.

26743 (CONF-921101–133) **Rheology and microstructure of concentrated zirconia-alumina suspensions for gelcasting composites.** Bleier, A.; Omatete, O.O. Oak Ridge National Lab., TN (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting; Boston, MA (United States); 30 Nov - 5 dec 1992. Order Number DE93015339. Source: OSTI; NTIS; GPO Dep.

The relations among colloidal stability, suspension rheology, and solids loading are elucidated for zirconia-alumina mixtures containing 20 volt ZrO_2, based on solids. The lower colloidal stability of ZrO_2 limits the rheological properties of this system. If the zeta potential of ZrO_2 is less than 49 mV, high degrees of pseudoplasticity, high yield stress, high viscosity, and long relaxation times characterize the binary suspensions. These effects occur, despite the fact that ZrO_2 is the minor ceramic constituent. If the zeta potential of ZrO_2 is maintained above 49 mV, suspensions with high solids loading (55 vol%) can be prepared which behave as Newtonian fluids over the 0-to-200 s-1 shear rate range and as an elastic solid at higher rates. As the solids loading of a highly stable binary suspension is increased, the rheological properties change. They evolve from those of a near Newtonian-like fluid with nearly independent particles (40 vol%) to those of a pseudoplastic fluid with a weakly interacting particle network (50 vol%) to those of an elastic-like solid composed of crowded, strongly repulsive particles (55 vol%). Low-shear conditions for suspension-transport and mold-filling operations that ensure a homogeneous arrangement of ZrO_2 and Al_2O_3 particles in a gelcast ceramic seem promising.

26744 (CONF-9211101–11) **Development of a constitutive model for creep and life prediction of advanced silicon nitride ceramics.** Ding, J.L. (Washington State Univ., Pullman, WA (US)); Liu, K.C.; Brinkman, C.R. Oak Ridge National Lab., TN (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Annual automotive development technology contractors' coordination meeting; Dearborn, MI (United States); 2-5 Nov 1992. Order Number DE93015894. A constitutive model capable of describing deformation and predicting rupture life was developed for high temperature ceramic materials under general thermal-mechanical loading conditions. The model was developed based on the deformation and fracture behavior observed from a systematic experimental study on an advanced silicon nitride (Si_3N_4) ceramic material. Validity of the model was evaluated with reference to creep and creep rupture data obtained under constant and stepwise-varied loading conditions, including the effects of annealing on creep and creep rupture behavior.

26745 (CONF-930164–11) **Multiaxial deformation and life prediction model and experimental data for advanced silicon nitride ceramics.** Ding, J.L. (Washington State Univ., Pullman, WA (United States). Dept. of Mechanical and Materials Engineering); Liu, K.C.; Brinkman, C.R. Oak Ridge National Lab., TN (United States). [1993]. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 17. annual conference on composites and advanced ceramics; Cocoa Beach, FL (United States); 11-15 Jan 1993. Order Number DE93015450. Source: OSTI; NTIS; GPO Dep.

This paper summarizes recent experimental results on creep and creep rupture behavior of a commercial grade of Si_3N_4 ceramic in the temperature range of 1150 to 1300C obtained at ORNL; and introduces a tentative multiaxial deformation and life prediction model for ceramic materials under general thermomechanical loadings. Issues related to the possible standardization of the data analysis methodology and possible future research needs for high temperature structural ceramics in the area of development of data base and life prediction methodology are also discussed.

26746 (CONF-930438–24) **Crystallization of grain boundary phases in silicon nitride with low additive contents by microwave annealing.** Tiegs, T.N. (Oak Ridge National Lab., TN (United States)); Ploetz, K.L.; Kiggans, J.O.; Yeckley, R.L. Oak Ridge National Lab., TN (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 95. annual meeting of the American Ceramic Society; Cincinnati, OH (United States); 18-22 Apr 1993. Order Number DE93015801. Source: OSTI; NTIS; GPO Dep.

Microwave annealing of dense Si_3N_4-4% Y_2O_3 materials showed improvements over conventional heating. Increases in fracture toughness were observed for annealing between 1200–1650C. The high temperature strength was related to the residual α-Si_3N_4 content which is indicative of a finer average grain size in the specimens. The high temperature dynamic fatigue showed increased stress to failure for specimens microwave annealed between 1400–1550C for periods >5 h. Silicon nitrides with different sintering additives would require different conditions for optimum crystallization. While there were some observed property improvements, they were not so dramatic to justify abandoning conventional over microwave heating. The Si_3N_4-4% Y_2O_3 materials used in the study were developed for elevated temperature use and already posses excellent good high temperature strength, fatigue resistance and creep properties. This is due to the very refractory nature of the grain boundary phases and the small quantity of secondary phase present. However, microwave annealing of these materials may be necessary in applications where the maximum in fracture toughness and fatigue resistance are required and thus justifies its use.

26747 (CONF-9304144–4) **Effects of depositon rate on $Bi_2Sr_2CaCu_2O_{8+x}$ and $Bi_2Sr_{1.6}La_{0.4}CuO_{6+x}$ epitaxial thin film growth by pulsed-laser ablation.** Zhu, S. (Tennessee Univ., Knoxville, TN (United States). Dept. of Physics and Astronomy); Lowndes, D.H.; Chakoumakos, B.C.; Christen, D.K.; Budai, J.D.; Zheng, X.Y.; Warmack, R.J. Oak Ridge National Lab., TN (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 2. international conference on laser ablation; Knoxville, TN (United States); 19-22 Apr 1993. Order Number DE93015797. Source: OSTI; NTIS; GPO Dep.

$Bi_2Sr_2CaCu_2O_{8+x}$ and $Bi_2Sr_{1.6}La_{0.4}CuO_{6+x}$ epitaxial films have been grown on (001) MgO and $SrTiO_3$ substrates at different deposition rates by pulsed-laser ablation(PLA). Surface morphology, crystallinity and superconducting critical temperature of the films depend sensitively on deposition rate even though ablation target composition and substrate temperature were kept almost constant. Scanning election microscopy showed that density of particles generated by PLA is reduced by decreasing the deposition rate. Results show that the highest quality films of the highly anisotropic

Bi-based materials are deposited by PLA at a low deposition rate, which results in film growth in a near-equilibrium state. 9 refs, 1 tab, 3 figs.

26748 (CONF-930682–2) **High-resolution Z-contrast imaging and hole concentration mapping of YBCO thin films.** Pennycook, S.J.; Browning, N.D.: Chisholm, M.F.; Zhu, S.; Feenstra, R.; Norton, D.P.; Lowndes, D.H. Oak Ridge National Lab., TN (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International workshop on superconductivity; Hokkaido (Japan); 28 Jun - 1 jul 1993. Order Number DE93015803. Source: OSTI; NTIS; INIS; GPO Dep.

Atomic-resolution Z-contrast electron microscopy provides a directly interpretable image showing the location of high-Z atomic columns without the need for any structural models. Usually, the type of column may be identified from its intensity, and the structure and morphology of interfaces, ultrathin films, and superlattices are directly revealed. This has generated many insights into growth and relaxation phenomena. Since the Z-contrast image uses only electrons scattered through large angles, electron energy loss spectroscopy may be performed simultaneously using the transmitted beam, providing information on the local hole concentration from the fine structure of the oxygen-K absorption edge. The resolution achieved is below the coherence length, allowing a microscopic interpretation of transport properties. 7 figs, 14 refs.

26749 (DOE/ER/12128–1) **Combustion synthesis and engineering of nanoparticles for electronic, structural and superconductor applications: Annual progress report, December 1, 1992–May 31, 1993.** Stangle, G.C.; Amarakoon, V.R.W.; Schulze, W.A. State Univ. of New York, Alfred, NY (United States). Coll. of Ceramics. 28 May 1993. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-93ER12128. Order Number DE93016286. Source: OSTI; NTIS; GPO Dep.

Fully dense, nanocrystalline ceramic articles were prepared by the new nanofabrication process. The process consists of two steps: synthesis of ceramic nanoparticles and fabrication of dense, nanocrystalline ceramic parts. The synthesis step produced 10-nanometer-diameter crystallites, and is capable of being scaled up to kilogram/hour production rates. The fabrication step produced dense parts at significantly reduced sintering temperatures and times – representing a factor of 10–100 reduction in process energy requirements. The process was demonstrated by producing ultrafine-grained yttria-stabilized ZrO_2, an important material with a variety of energy-related applications (solid electrolytes, oxygen sensors, electrode materials, thermal barrier coatings, etc.). Results from this period clearly illustrate the capabilities of this energy-efficient and directly commercializable process for producing dense, nanocrystalline, multicomponent oxide ceramics.

26750 (DOE/ER/45249–T2) **Summary report of research accomplishments.** Munir, Z.A. California Univ., Davis, CA (United States). Dept. of Mechanical, Aeronautical and Materials Engineering. Apr 1992. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-86ER45249. Order Number DE93016296. Source: OSTI; NTIS; GPO Dep.

Recent work dealing with combustion synthesis of ceramics, metallics, and composites, is summarized. Research was carried out to investigate the mechanism of synthesis in simple (nitrides and silicides, particularly TiN), composite (TiC + NiAl), and solid solutions (TiNC). 17 figs.

26751 (DOE/ER/45391–4) **Theory of the electronic and structural properties of solid state oxides: Annual technical report 1993.** Chelikowsky, J.R. Minnesota Univ., Minneapolis, MN (United States). Dept. of Chemical Engineering and Materials Science. [1993]. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER45391. Order Number DE93016051. Source: OSTI; NTIS; GPO Dep.

Emphasis has been on the electronic materials: silica, titania, and ruthenia. Fundamental interest centered on nature of microstructure of these solids in the amorphous state, or mixed oxide state. New theoretical techniques have been implemented to examine such issues, based on ab initio pseudopotential methods and interatomic potentials. Some areas examined under this project are: (1) Nature of the amorphization transformation of quartz under pressure. Specific focus is on the microscopic nature of the amorphous material and the driving forces for amorphization. (2) Equation of states of crystalline silica polymorphs. (3) Elastic anomalies in silica. In particular, the existence of a "negative" Poisson ratio in high temperature, low density forms of crystalline silica. (4) Optical and structural properties of titania and mixed oxides such as $Ru_xTi_{1-x}O_2$.

26752 (DOE/ER/45431–3) **First-principles studies of phase stability and the structural and dynamical properties of hydrogen-metal systems: Final report.** Chou, M.Y. Georgia Inst. of Tech., Atlanta, GA (United States). School of Physics. May 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-90ER45431. Order Number DE93016129. Source: OSTI; NTIS; INIS; GPO Dep.

First-principles calculations were carried for the hydrogen-yttrium system using the pseudopotential method within the local density functional approximation (LDA). We have studied the nature of hydrogen pairing in the solid solution phase (α-YH_x) and identified the connection with electronic structure. The vibrational spectra, diffusion barrier, and migration path were also investigated. We have also studied the binding characteristics for different interstitial sites and the (420)-plane ordering of octahedral hydrogen in βYH_{2+x} within the lattice gas model. Temperature-composition phase diagram was calculated by cluster variational method with the multibody interactions extracted from total energies of related ordered structures. Moreover, the discovery of Peierls distortions in YH_3 explained the unusual hydrogen displacements found in neutron diffraction and the possibility of an excitonic insulating ground state was speculated. Several new improvements in the calculational techniques also been developed: Separable nonlocal pseudopotentials, scheme to calculate the full phonon spectrum, and distance dependent tight-binding parameters. The Ru(0001)-H system was also studied.

26753 (INIS-BR–3122) **Determination of thermodynamic properties and stability limit from fluorite phase of uranium and lanthanide mixed oxides, using galvanic cells with solid electrolytes.** Santiago, T.N. Pernambuco Univ., Recife, PE (Brazil). Dept. de Energia Nuclear. Oct 1980. [59p.] (In Portuguese). Order Number DE93629207. Source: OSTI; NTIS (US Sales Only); INIS.

A method for thermodynamic properties determination for oxygen solubility in oxide systems at temperature interval $973 \leq T\ [K] \leq 1773$ is described. A galvanic cell using as solid electrolytes zircon dioxide doped with 15% of calcium oxide is presented. This method was used for determining the phase change, temperature dependent, of uranium-lanthanides-oxygen Ln U O_4 stoichiometric system. (C.G.C.).

26754 (JINR-R–17-91-340) **Oxygen diffusion in $YBa_2Cu_3O_{6+\delta}$ ceramics on heating.** Balagurov, A.M.; Vuong, N.V.; Kuan, Ch.A.; Kui, L.K.; Chieu, F.K. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1991. [10p.] (In Russian). Order Number DE93629161. Source: OSTI; NTIS (US Sales Only); INIS.

The oxygen diffusion in $YBa_2Cu_3O_{6+\delta}$-ceramics by heating the samples from room temperature to 350 deg C with constant rate v=0.5, 1, 2 and 3 deg C/min was investigated. It has been shown, that the oxygen uptake in initial sample $YBa_2Cu_3O_6$ can be described by the one-dimensional diffusion model. The diffusion coefficient in the tetra-phase at $T \leq 500$ deg C is confirmed to be $D(cm^2/sec)=(0.84\text{-}3.4)x10^{-4}$ exp (-0.6 eV/KT). 18 refs.; 2 figs.; 2 tabs.

26755 (JINR-R–17-91-341) **Description of oxygen diffusion in $YBa_2Cu_3O_{6+\delta}$ ceramics.** Vuong, N.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1991. [10p.] (In Russian). Order Number DE93629191. Source: OSTI; NTIS (US Sales Only); INIS.

The one-dimension diffusion model of oxygen uptakes in $YBa_2Cu_3O_{6+\delta}$-ceramics has been presented. The calculated results were compared with experimental data. The oxygen diffusion coefficient has been estimated for temperatures 150-700 deg C and oxygen partial pressures 1.4-10.7 atm. 14 refs.; 2 figs.; 1 tab.

26756 (JINR-R-17-91-342) **Influence of the granular surface on the oxygen uptake in $YBa_2Cu_3O_{6+\delta}$ ceramics.** Vuong, N.V.; Tuong, V.Kh.; Kui, L.K.; Chieu, F.K. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1991. [6p.] (In Russian). Order Number DE93629162. Source: OSTI; NTIS (US Sales Only); INIS.

It is proposed the method of 'hot grinding' for the quick oxygen uptake in $YBa_2Cu_3O_x$. The oxygen content in the initial sample $YBa_2Cu_3O_{6.1}$ after grinding at 350 deg C in air for 15 min was increased to 6.88 and the limit value of x=6.97 was obtained by this way for 300 min. 5 refs.; 2 figs.; 1 tab.

26757 (LA-UR–93-1282) **Plastic anisotropy in $MoSi_2$ single crystals.** Mitchell, T.E.; Maloy, S.A. Los Alamos National Lab., NM (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9303161–1: Critical issues in the development of high temperature structural materials meeting, Kona (Japan), 8-12 Mar 1993). Order Number DE93012650. Source: OSTI; NTIS; GPO Dep.

Single crystals Of $MoSi_2$ are an order of magnitude stronger when compressed along [001] than along any other orientation. This is because the easy slip systems, <101><100> and <110><111>, have a zero Schmid factor acting on them so that harder slip systems are forced into operation. We find that [001] crystals compressed at 1OOOC yield by slip on <103><331>. TEM shows that the 1/2<331> dislocations tend to decompose into 1/2<111> and <110> dislocations. This decomposition process apparently inhibits the mobility of 1/2<331> dislocations at higher temperatures and another system, <101><1ll>, becomes operative at 1300C and above. [021] crystals have been tested for comparison and are found to yield at much lower stresses on the easy systems. In the design of advanced high temperature structural materials based on $MOSi_2$, the large plastic anisotropy should be used to advantage.

26758 (LA-UR–93-1285) **A thermokinetic model describing the vaporization behavior of $U_xZr_{1-x}C_{1-y}$ in hydrogen.** Butt, D.P. Los Alamos National Lab., NM (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930103–35: 10. symposium on space nuclear power and propulsion, Albuquerque, NM (United States), 10-14 Jan 1993). Order Number DE93012649. Source: OSTI; NTIS; GPO Dep.

This paper describes the thermodynamics and kinetics of the corrosion of $U_xZr_{1-x}C_{1-y}$ in hydrogen gas. It describes how corrosion rates are influenced by variables such as pressure, temperature, and gas flow rate. A model is developed which agrees with experimental steady-state corrosion rates at 1 atm between 2670 and 3100 K. It is shown that under steady-state conditions the corrosion flux is rate limited by the vapor phase transport of Zr(g) away from the solid surface to the bulk gas stream where the partial pressure of Zr(g) is determined by the congruently vaporizing surface composition. Extrapolation of the model to higher pressures indicates that Zr(g) transport should also be rate limiting at higher pressures but the corrosion rate should decrease slightly with increased hydrogen pressure due to reduced gaseous diffusion rates. The model predicts that the corrosion rate will increase as the square root of gas velocity for a given temperature and pressure. Calculations demonstrating the effects of gas velocity are in agreement with experimental studies.

26759 (LA-UR–93-1306) **Microwave hybrid heating of alumina filaments.** Vogt, G.J.; Unruh, W.P. Los Alamos National Lab., NM (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930438–9: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93012642. Source: OSTI; NTIS; GPO Dep.

Low loss oxide ceramics filaments are not readily heated to sintering temperatures (>900°C) by direct microwave heating at 2.45 GHz. Use of high power levels typically yields thermal runaway with catastrophic melting. In other studies, hybrid, or indirect, heating has been successfully applied to processing bulk oxide ceramics. In this work, commercial alumina-based filaments have been indirectly heated to 700°–900°C through a lossy carbon coating on the filament tow. Specific filaments can reach higher temperatures by direct coupling after preheating with a lossy coating. The results of microwave hybrid heating in a single mode TE_{102} cavity will be described for commercial alumina-based filaments.

26760 (LA-UR–93-1456) **Microwave sintering of large alumina bodies.** Blake, R.D.; Katz, J.D. Los Alamos National Lab., NM (United States). [1993]. 9p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930438–6: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93012752. Source: OSTI; NTIS; GPO Dep.

The application of microwaves as an energy source for materials processing of large alumina bodies at elevated temperatures has been limited to date. Most work has concerned itself with small laboratory samples. The nonuniformity of the microwave field within a cavity subjects large alumina bodies to areas of concentrated energy, resulting in uneven heating and subsequent cracking. Smaller bodies are not significantly affected by field nonuniformity due to their smaller mass. This work will demonstrate a method for microwave sintering of large alumina bodies while maintaining their structural integrity. Several alumina configurations were successfully sintered using a method which creates an artificial field or environment within the microwave cavity.

26761 (LA-UR–93-1518) **Synthesis of ceramic oxide powders in a microwave plasma device.** Vollath, D.; Sickafus, K.E. Los Alamos National Lab., NM (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930927–1: 3. conference of the European Ceramic Society, Madrid (Spain), 13-17 Sep 1993). Order Number DE93012741. Source: OSTI; NTIS; GPO Dep.

Synthesizing oxide ceramic powders by application of a microwave plasma is of great advantage. The microwave plasma can be used two ways: To act as a source of heat for the pyrolysis of solutions and to excite gas phase reactions to obtain nanosized powders. Both applications are superior to standard methods. A microwave cavity well suited for these experiments and its operating characteristics are described. Using a microwave plasma as a source of heat for pyrolytic decomposition of nitrates in aqueous solutions leads to a fine grained product with particle sizes from 100 to 1000 nm. Crystallite sizes in those particles are in most cases less than 10 nm. This is demonstrated with zirconia-based ceramics, such as ZrO_2 – 3m% Y_2O_3 – 20m% Al_2O_3, Depending on conditions during pyrolysis, it is possible to obtain a product in which alumina is either dissolved in zirconia or the onset of the phase separation is observed. Energy efficiency for this process is better than 80%. If the reactants are gaseous e.g., $ZrCl_4$ it is possible to produce powders with mean crystallite sizes of about 4 nm. In the case of zirconia these particles are nanocrystalline with a cubic structure. This structure is not in equilibrium under the experimental conditions.

26762 (LA-UR–93-1705) **Measurement of penetration depth $\lambda(T)$ in $YBa_2Cu_3O_{7-\delta}$ thin film.** Lee, J.Y. (Ohio State Univ., Columbus, OH (United States). Dept. of Physics); Lemberger, T.R.; Foltyn, S.; Wu, X.D. Los Alamos National Lab., NM (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930801–2: Conference of the International Union of Pure and Applied Physics on low temperature physics (LT 20), Eugene, OR (United States), 1-11 Aug 1993). Order Number DE93014587. Source: OSTI; NTIS; GPO Dep.

We present the magnetic penetration depth $\lambda(T)$ in two laser ablated $YBa_2Cu_3O_{7-\delta}$ thin films, determined by the two-coil method. The slope of $1/\lambda^2(T)$ near T_c, the only exactly measurable quantity, extrapolates to 930Å at T=0, which compares well with 830Å in the high quality single crystal recently reported by Hardy et al., and which exhibited a linear T dependence at low T. For $T < 30K$, we find $\lambda(T)/\lambda(0)-1 = a(T/T_c)^2$ where a=0.5.

26763 (LBL–33971) **Direct submillimeter absorptivity measurements on epitaxial $Ba_{1-x}K_xBiO_3$films at 2K.** Miller, D. (Lawrence Berkeley Lab., CA (United States)); Richards, P.L.; Nicol, E.J.; Hellman, E.S.; Hartford, E.H. Jr.; Platt, C.E.; Schweinfurth, R.A.; VanHarlingen, D.J.; Amano, J. Lawrence Berkeley Lab.,

CA (United States). Apr 1993. 4p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant: STC-90-09854. (CONF-930367–5: Conference on spectroscopies in novel superconductors, Santa Fe, NM (United States), 17-19 Mar 1993). Order Number DE93013904. Source: OSTI; NTIS; INIS; GPO Dep.

We have used a bolometric technique to obtain accurate low temperature loss data for epitaxial thin films of $Ba_{0.6}K_{0.4}BiO_3$ from 30 to 700 cm^{-1}. These films were grown on MgO and $SrTiO_3$ substrates by MBE, off-axis sputtering and laser deposition techniques. All films show a strong absorption onset near the BCS tunneling gap of $3.5k_BT_c$. We have analyzed these data using a Kramers-Kronig transformation and have corrected for finite film thickness effects. Results indicate that the absorption onset is consistent with a superconducting energy gap. Comparison is made with predictions based on strong coupling Eliashberg theory using $\alpha^2F(\omega)$ spectra obtained from the literature. While we are able to fit the overall measured absorptivity, we are unable to fit the structure observed in our data.

26764 (LNS–169) **Neutron spectroscopic investigations on crystalline-electric-field and exchange interactions on high-Tc superconductors.** Staub, U. Eidgenoessische Technische Hochschule, Zurich (Switzerland). May 1993. [141p.] (In German). Order Number DE93630537. Source: OSTI; NTIS; INIS.

Diss. ETH Nr. 10161.

It is well known that in the high temperature superconductors of the type $RBa_2Cu_3O_x$(123), with R=Y and most of the rare earths, superconductivity is believed to be controlled by the density of mobile charges in the copper oxide (CuO_2) planes. In particular, the charge transfer process from the chains to the planes seems to play an important role. In the 123, $RBa_2Cu_4O_8$ (1248) and the $Bi_2Sr_2Ca_{1-x}Ho_xCu_2O_{8+\delta}$ (Bi2212) systems, the R ions are sandwiched between the CuO_2 planes, thus the crystalline electric field (CEF) interaction at the R sites constitutes an ideal probe of the local symmetry and the charge distribution of the superconducting planes. The (2J+1)-fold degeneracy of the ground-state J-multiplet of the rare earth ions will be partially lifted under the action of the CEF potential. By means of inelastic neutron scattering experiments it is possible to observe directly the transitions between the CEF states. Therefrom we obtain useful information on both the structure and the charge distribution in the vicinity of the R ion. In order to quantify the charge transfer process from the chains to the planes, we performed a detailed analysis of the CEF of Ho^{3+} in the 123, 1248 and Bi2212 systems. In addition, we present some experiments on a Cl doped 123 sample and some external pressure experiments on the 123 system. In nearly all high-T_c compounds $RBa_2Cu_3O_{7-\delta}$ superconductivity and magnetic ordering of the R ion sublattice coexist at low temperatures. In order to understand the interplay of magnetism and superconductivity in these systems, information on both the electronic ground state of the R^{3+} ions and the coupling mechanisms between the R^{3+} ions is highly desirable. (author) figs., tabs., 73 refs.

26765 (ORNL/FTR–4381) **Travel to Germany to attend the international conference on defects in insulating materials: Foreign trip report, August 14–31, 1992.** Chen, Yok. Oak Ridge National Lab., TN (United States). 29 Sep 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012414. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the International Conference on Defects in Insulating Materials (ICDIM) in Nordkirchen, Germany, to present two papers and visited the Universidad Carlos III in Madrid, Spain for collaborative research.

26766 (ORNL/TM–12375, pp. 110-124) **Formalization of an ontology of ceramic science in Classic.** Speel, P.H. (Univ. of Twente, Enschede (NL)); Vet, P.E. van der; Stal, W. ter; Mars, N.J.I. Oak Ridge National Lab., TN (United States). May 1993. (CONF-9306151–: 7. international symposium on methodologies for intelligent systems, Trondheim (Norway), 15-18 Jun 1993). In *Proceedings of the Seventh International Symposium on Methodologies for Intelligent Systems (Poster Session).* 174p. Order Number DE93013470. Source: OSTI; NTIS.

Recently, the term "ontology" has become popular in the field of (artificial intelligence) AI. However, often confusion arises when one is attempting to relate an ontology to existing AI subjects. It is argued that an ontology (i) is situated within the conceptualization stage of knowledge-based system (KBS) development methods, (ii) specifies the domain on which logic-based knowledge representation (KR) languages are defined semantically, and (iii) represents the terminological/description (and not the assertional) component. The authors have developed an ontology for a subdomain of materials science, called ceramic science. The ontology has been formalized and implemented in the CLASSIC KR language to allow its use within the Plinius project. (The aim of the Plinius project is to build a system which is able to semi-automatically extract knowledge from natural-language texts concerning ceramics.) In this paper, the authors first concentrate on the integration of the three previously mentioned AI subjects and the face of an ontology in this integrated whole. Then, they focus on both the syntactical and semantical formalization of the Plinius ontology in the CLASSIC KR language. It is argued that the semantics of the formulae need to be defined in order to guarantee the correctness of these formulae with respect to a model which includes the Plinius ontology. 29 refs., 2 figs.

26767 (PNL–8622) **Fabrication of advanced design (grooved) cermet anodes.** Windisch, C.F. Jr. (Pacific Northwest Lab., Richland, WA (United States)); Huettig, F.R. Pacific Northwest Lab., Richland, WA (United States). May 1993. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93014590. Source: OSTI; NTIS; GPO Dep.

Attempts were made to fabricate full-size anodes with advanced, or grooved, design using isostatic pressing, slip casting injection molding. Of the three approaches, isostatic pressing produced an anode with dimensions nearest to the target specifications, without serious macroscopic flaws. This approach is considered the most promising for making advanced anodes for aluminum smelting. However, significant work still remains to optimize the physical properties and microstructure of the anode, both of which were significantly different from that of previous anodes. Injection molding and slip casting yielded anode materials with serious deficiencies, including cracks and holes. Injection molding gave cermet material with the best intrinsic microstructure, i.e., the microstructure of the material between macroscopic flaws was very similar to that of anodes previously made at PNL. Reason for the similarity may have to do with amount of residual binder in the material prior to sintering.

26769 (SAND–92-2490C) **Solution chemistry optimization of sol-gel processed PZT thin films.** Lockwood, S.J. Schwartz, R.W.; Tuttle, B.A.; Thomas, E.V. Sandia National Labs., Albuquerque, NM (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9305195–1: 1993 Spring meeting of the Materials Research Society (MRS), San Francisco, CA (United States), 12-16 May 1993). Order Number DE93013776. Source: OSTI; NTIS; GPO Dep.

We have optimized the ferroelectric properties and microstructural characteristics of sol-gel PZT thin films used in a CMOS-integrated, 256 bit ferroelectric non-volatile memory. The sol-gel process utilized in our work involved the reaction of Zr n-butoxide, Ti isopropoxide, and Pb (IV) acetate in a methanol/acetic acid solvent system. A 10-factor screening experiment identified solution concentration, acetic acid addition, and water volume as

the solution chemistry factors having the most significant effects on the remanent polarization, coercive field, ferroelectric loop quality, and microstructural quality. The optimal values for these factors were determined by running a 3-factor uniform shell design, modeling the responses, and testing the models at the predicted optimal conditions. The optimized solution chemistry generated 3-layer, 300–400 nm thick films on RuO_2 coated silicon substrates with coercive fields of less than 25 kv/cm (a 40–50% improvement over the original solution chemistry), a remanent polarization of 25–30 μC/cm, and a reduction in the pyrochlore phase content below observable levels.

26770 (SAND–93-1068C) **Problems and opportunities in microwave joining of ceramics.** Loehman, R.E. Sandia National Labs., Albuquerque, NM (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930438–23: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93014998. Source: OSTI; NTIS; GPO Dep.

This document reviews briefly ceramic joining and considers some aspects relevant to heating using microwave energy. It is concluded that the general applicability of microwave heating for ceramic joining has yet to be demonstrated. There are particular applications, such as joining of SiC to itself, that may hold promise. However, more work needs to be done.

26771 (ANL/MCT/CP–78063) **Mechanical properties of magnesium ammonium phosphate cements and their zeolite composites.** Wagh, A.S.; Singh, D.; Subhan, W.; Chawla, N. Argonne National Lab., IL (United States). Materials and Components Technology Div. Apr 1993. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930438–21: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93015155. Source: OSTI; NTIS; GPO Dep.

Phosphate-bonded cements have been proposed as candidates for solidification and stabilization of mixed wastes. Magnesium ammonium phosphate (MAP) has been investigated as a candidate material. Detailed physical and mechanical properties of MAP cement are reported. It is synthesized by the route of reaction of calcined MgO and ammonium phosphate solution. Samples are made by setting the cement at room temperature and slight pressure. The porosity is reduced to ~11% by impregnation of ammonium phosphate solution. Detailed mechanical properties such as flexural strength, fracture toughness and compression strength are reported and fracture mechanical analyses supported with scanning electron microscopy are provided. Properties of composites of these cements with zeolites, which may be used for containment of radioactive as well as chemical waste are studied. We demonstrate that the strengths of these composites compare well with portland cement even after 50% loading of zeolites. Fracture mechanical implications of such loadings are given.

26772 (ANL/MSD/CP–79640) **de Haas-van Alphen studies and Fermi surface properties of organic superconductors $(ET)_2X$.** Wosnitza, J. (Karlsruhe Univ. (T.H.) (Germany). Physikalisches Inst.); Crabtree, G.W.; Williams, J.M.; Wang, H.H.; Carlson, K.D.; Geiser, U. Argonne National Lab., IL (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9208132–13: 1992 international conference on science and technology of synthetic metals (ICSM), Goeteborg (Sweden), 12-18 Aug 1992). Order Number DE93015157. Source: OSTI; NTIS; GPO Dep.

de Haas-van Alphen (dHvA) measurements of organic superconductors $(ET)_2X$, where ET stands for bis(ethylene)dithiotetrathiafulvalene (or BEDT-TTF) and X = IBr_2, $(NH_4)Hg(SCN)_4$ and $Cu(NCS)_2$ are reported. The strong two-dimensionality of the Fermi surface (FS) is clearly seen by the perfect $1/\cos(\Theta)$-behavior of the dHvA frequency. The distinctive kind of beating and the angular dependence of the dHvA signal in β-$(ET)_2IBr_2$ gives clear evidence for a lightly corrugated structure of the FS. Due to the nearly cylinder-shape of the FS the bare band structure effective mass, m_b, also shows a $1/\cos(\Theta)$-dependence which is responsible for spin splitting zeros at certain angles. At these points, where the fundamental amplitude of the dHvA signal is vanishing, m_b could exactly be determined and by comparison with the independently measured cyclotron effective mass the electron-phonon coupling constant could be estimated. 17 refs, 5 figs.

26773 (BARC–1992/E/030) **Preparation of synthetic diamond films at sub-atmospheric pressure and their characterisation.** Dua, A.K. (Bhabha Atomic Research Centre, Bombay (India). Chemistry Div.); Pruthi, D.D.; George, V.C.; Raj, P. Bhabha Atomic Research Centre, Bombay (India). 1992. [28p.] Order Number DE93630597. Source: OSTI; NTIS (US Sales Only); INIS.

The salient features of hot filament chemical vapour deposition facility indigenously designed and fabricated are reported. It has been used to deposit high quality diamond on Si(100), Mo, Ta, W, Nb, Zr, Fe, Ni, Cu, stainless steel and alumina substrates. The diamond coatings have been characterised unambiguously using scanning electron microscopy, laser Raman spectroscopy and X ray diffraction technique. It is possible to deposit multilayer, continuous, faceted type polycrystalline films up to 24 μ thick over an area 25x12 mm^2 and at a rate up to 3 μ/hr. (author). 9 refs., 20 figs.

26774 (CONF-920792–61) **Optical and infrared spectra of thermally annealed Pb implanted SiO_2 glasses.** Henderson, D.O. (Fisk Univ., Nashville, TN (United States). Dept. of Physics); Morgan, S.H.; Mu, R.; Magruder, R.H. III; Anderson, T.S.; Wittig, J.E.; Zuhr, R.A. Oak Ridge National Lab., TN (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States); Federal Aviation Administration, Washington, DC (United States). DOE Contract AC05-84OR21400. From 37. annual Society of Photo-Optical Instrumentation Engineers (SPIE) international symposium on optical and optoelectronic applied science and engineering; San Diego, CA (United States); 19-24 Jul 1992. Order Number DE93015304. Source: OSTI; NTIS; GPO Dep.

Infrared reflectance between 4000 and 100 cm^{-1} and optical spectra between 1.8 and 6.2 eV of high purity silica implanted with nominal doses of 1, 3 and 6 x 10^{16} Pb ions/cm^2 were recorded before and after annealing at 400, 600, and 800C for 1 hour. Curve resolution analysis of the Si-O stretching region resulted in six peaks which were characterized by their lineshape parameters. The oscillator strength of the ion induced defect peak at 1035 cm^{-1} was found to depend on ion dose. The defect band at 1035 cm^{-1} decreased to an intensity comparable to that of the unimplanted glass after thermal annealing for 1 hour at 800C. Far infrared spectra indicated the formation of lead silicate particles after annealing.

26775 (CONF-9209253–5) **Scintillation mechanism in stoichiometric cerium compounds.** Wojtowicz, A.J. (Boston Univ., MA (United States). Dept. of Chemistry); Lempicki, A.; Berman, E. Boston Univ., MA (United States). Dept. of Chemistry; ALEM Associates, Boston, MA (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER61033 ;FG02-92ER81360. From Crystal 2000 international workshop on heavy scintillators for scientific and industrial applications; Chamonix (France); 22-26 Sep 1992. Order Number DE93015499. Source: OSTI; NTIS; INIS; GPO Dep.

These materials constitute a new class of scintillator media, with high speed and high light output. This is illustrated using CeF_3, and CeP_5O_{14}. While speed, being limited by a radiative lifetime of an allowed d-f transition on the Ce^{+3} ion, cannot be improved (without loss of the light output), the light output in both cases falls significantly below the estimated theoretical limit. To explain this we propose a mechanism of scintillation process, in which transfer of excitation energy from the lattice to the d-f electronic structure of Ce^{+3} ions is absent and the light output of the scintillator is limited to the excitation energy directly intercepted by Ce ions. The efficiency depends, therefore, on the competition for holes between

Ce^{+3} ions and anions, determining the share of the total energy deposited by a high energy particle, which can be transformed into scintillation photons. The mechanism requires that the Ce ion has a stable 4+ charge state. Ionization of Ce^{+3} is followed by capturing of an electron and creation of the Ce bound exciton. In the next step the energy of the bound exciton is transferred to the d-f structure of the Ce ion and, in the final step, a scintillation photon is emitted. The relatively high light output characteristic of these materials is due to the high concentration of Ce ions. The reasons for the lack of efficient energy transfer from the lattice may reside in large relaxation energies of lattice excitations. We use this model to discuss potential improvements in the light output of CeF_3.

26776 (CONF-921101–130) **Lattice site of helium implanted in Si and diamond.** Allen, W.R. Oak Ridge National Lab., TN (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting; Boston, MA (United States); 30 Nov - 5 dec 1992. Order Number DE93015365. Source: OSTI; NTIS; GPO Dep.

Single crystals of silicon and diamond were implanted at 300K with 70 keV ^{3}He. Ion channeling analyses were executed by application of Rutherford backscattering spectrometry and nuclear reaction analysis. Helium exhibits a non-random lattice site in the channeling angular distributions for silicon and diamond. A major fraction of the implanted ^{3}He was qualitatively identified to be near to the tetrahedral interstice in both materials. However, greater occupation of tetrahedral interstices was noted in Si.

26777 (CONF-921206–13) **Structural investigation of electrochemically etched silicon.** Heuser, B.J. (Missouri Univ., Columbia, MO (United States). Research Reactor Facility); Spooner, S.; Glinka, C.J.; Gilliam, D.L.; Winslow, N.A.; Boley, M.S. Oak Ridge National Lab., TN (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC05-84OR21400. Grant DMR91224444. From Materials Research Society (MRS) symposium; Boston, MA (United States); 2-6 Dec 1992. Order Number DE93015300. Source: OSTI; NTIS; GPO Dep.

Small-angle neutron scattering, (SANS) measurements of four electrochemically etched, porous (PS) samples have been performed over a wide wavevector transfer (Q) range. The intermediate to high Q results can be modeled with a non-particulate, random phase model. Correlation length scales on the order of 1 to 2 nm thought to characterize the PS skeleton have been deduced from the SANS data. The microstructural anisotropy was studied by tilting two of the samples with respect to the neutron beam. These samples exhibited an asymmetric scattering pattern at intermediate $Q(0.1 \leq Q \leq 0.6\ nm^{-1}$ in this condition. Photoluminescence spectra from all four samples have been recorded as well. A correlation appears to exist between the SANS and photoluminescence measurements. An x-ray diffraction measurement of one sample demonstrates that the PS layer retains the silicon lattice structure. Significant peak broadening is observed and is interpreted as a quasi-particle size effect. The PS particle size calculated from the x-ray diffraction measurement is equal to the correlation length obtained in the SANS measurement.

26778 (CONF-930164–12) **Modeling the thermal conductivity of fiber-reinforced ceramic composites.** Beecher, S.C.; Dinwiddie, R.B. Oak Ridge National Lab., TN (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 17. annual conference on composites and advanced ceramics; Cocoa Beach, FL (United States); 11-15 Jan 1993. Order Number DE93015340. Source: OSTI; NTIS; GPO Dep.

A review of models for the prediction of the thermal conductivity of uni-directional fiber-reinforced composites will be presented. The ability of these models to give an accurate prediction of the composite thermal conductivity depends on the amount of information known about the constituent phase properties under the assumption that these properties do not change as a result of processing. Also presented are models that take into account the effects of fiber coatings.

26779 (CONF-930318–10) **Corrosion kinetics and mechanisms for nuclear grade graphites.** Fuller, L.E. Jr.; Kopp, O.C.; Underwood, A.D. Oak Ridge National Lab., TN (United States). [1993]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From NACE annual corrosion conference and materials performance and corrosion show; New Orleans, LA (United States); 7-12 Mar 1993. Order Number DE93015462. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report is an initial microgravimetric evaluation of the intrinsic reaction parameters for air reactions with H-451 graphite at 375 to 850C at atmospheric pressure and for water contents from 0 to 2 vol% water vapor. Photography show heterogeneous nature of the graphite and consequential variation of reaction rate as the samples are etched and roughened in the corrosion processes. The reaction rate increases approximately two fold to a near-constant value and subsequently approaches zero as the remnant skeletal matrix is consumed. There appears to be no significant rate effect (neither catalytic nor impedimental) due to the presence of water vapor in the concentrations used.

26780 (CONF-9304144–3) **Negative ion formation in small carbon clusters.** Carman, H.S. Jr.; Compton, R.N. Oak Ridge National Lab., TN (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 2. international conference on laser ablation; Knoxville, TN (United States); 19-22 Apr 1993. Order Number DE93015436. Source: OSTI; NTIS; GPO Dep.

Laser ablation of graphite into a rare gas supersonic jet has been used to generate C_m clusters (both neutral and ionic) in the size range $m \leq 30$. Negative ions produced by three different mechanisms have been studied: (1) ion formation during the ablation process, (2) low energy electron attachment (Rydberg electron transfer) to neutral clusters, and (3) charge transfer from ground state rubidium atoms to neutral clusters. The C_m^- distributions observed for the three cases are distinctly different, providing insights into the structures, stabilities, and electron attachment dynamics of small carbon clusters.

26781 (CONF-9306183–1) **Insights into semiconducting materials and growth phenomena through Z-contrast STEM.** Pennycook, S.J.; Jesson, D.E.; Chisholm, M.F.; Browning, N.D. Oak Ridge National Lab., TN (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 20. annual meeting of the Microscopical Society of Canada (MSC); Toronto (Canada); 2-5 Jun 1993. Order Number DE93015964. Source: OSTI; NTIS; GPO Dep.

The high-angle annular detector proposed by Howie is used to form an atomic-resolution Z-contrast image in a high-resolution scanning transmission electron microscope. For incoherent scattering, the coherent probe is effectively channeled along each individual atomic column, forming a basis for atomic-resolution incoherent imaging and atomic-resolution microanalysis. Incoherent imaging is combined with strong compositional sensitivity. Since a model structure is not needed to interpret the images to first order, unexpected interfacial phenomena are immediately apparent, such as the compositional ordering at a $CoSi_2$/Si(100) interface made by high-dose Co implantation and annealing. Growth and relaxation of strained Si_xGe_{1-x} layers are studied. Combining atomic-resolution imaging and analysis on a single microscope is a powerful method for studying interfaces without any prior knowledge or model structures. 7 figs, 19 refs.

26782 (CONF-930961–2) **Overview of chemical vapor infiltration.** Besmann, T.M.; Stinton, D.P.; Lowden, R.A. Oak Ridge National Lab., TN (United States). [1993]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International conference on high temperature ceramic matrix composites; Bordeaux (France); 20-25 Sep 1993. Order Number DE93015440. Source: OSTI; NTIS; GPO Dep.

chemical vapor infiltration (CVI) is developing into a commercially important method for the fabrication of continuous filament ceramic composites. Current efforts are focused on the development of an improved understanding of the various processes in CVI and its modeling. New approaches to CVI are being explored, including

pressure pulse infiltration and microwave heating. Material development is also proceeding with emphasis on improving the oxidation resistance of the interfacial layer between the fiber and matrix. This paper briefly reviews these subjects, indicating the current state of the science and technology.

26783 (CONF-9309149–1) **Nextel™/SiC composites fabricated using forced chemical vapor infiltration.** Weaver, B.L. (3M Co., St. Paul, MN (United States)); Lowden, R.A.; McLaughlin, J.C.; Stinton, D.P.; Besmann, T.M.; Schwarz, O.J. Oak Ridge National Lab., TN (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From HTCMC meeting; No City Given (France); 20-23 Sep 1993. Order Number DE93013532. Source: OSTI; NTIS; GPO Dep.

Oxide fiber-reinforced silicon carbide matrix composites were fabricated employing the forced-flow, thermal gradient chemical vapor infiltration (FCVI) process. Composites using Nextel™ fibers of varying composition were prepared to investigate the effectiveness of each Nextel™ fiber as a reinforcement for the given matrix. A carbon interface coating was used for the baseline materials, however, alternate interlayers with improved oxidation resistance were also explored Room-temperature flexure strengths of as-fabricated composites and specimens heated in air at 1273 K were measured and compared to results for other SiC-matrix composites.

26784 (DOE/ER/14275–1) **[Transport properties of disordered porous media from the microstructure]: Progress report, March 1989–June 1993.** Princeton Univ., NJ (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER14275. Order Number DE93016065. Source: OSTI; NTIS; GPO Dep.

Progress was made in 4 general areas: quantitative characterization of microstructure via n-point distribution functions; determination of bounds on effective properties that depend on these n-point functions (conductivity, NMR, permeability); derivation of cross- property relations; and development of efficient first-passage time algorithms (Brownian-motion simulations) to compute effective diffusion properties.

26785 (DOE/ER/45237–7) **[Phase transition in polymer blends and structure of ionomers and copolymers]: [Annual report, April 1, 1989–June 30, 1993].** State Univ. of New York, Stony Brook, NY (United States). Dept. of Chemistry. [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER45237. Order Number DE93016256. Source: OSTI; NTIS; GPO Dep.

The main thrust of the program in the past 3 years are summarized: SAXS instrumentation development; structure and dynamics of macro- and supra-molecules, phase transitions in polymer blends and solutions, structure of ionomers, and fractals and anisotropic systems.

26786 (DOE/ER/45298–9) **Synthesis and properties of novel cluster phases: Progress report, [June 30, 1993].** DiSalvo, F. Cornell Univ., Ithaca, NY (United States). Dept. of Chemistry. 15 Jan 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER45298. Order Number DE93017056. Source: OSTI; NTIS; GPO Dep.

The research was in the area of solid cluster compounds containing metal clusters. Two classes of materials were studied: those based on solutions formed by dissolving $LiMo_3Se_3$ in polar solvents, and those based on M_6X_8 clusters. The cluster phases were synthesized and their properties examined. Nb_6I_{11} and Mo_6X_8 were also studied.

26787 (DOE/ER/45362–3) **Stabilization of high T_c superconductivity in cadmium sulfide: Final report.** MacCrone, R.K.; Nettel, S.J. Rensselaer Polytechnic Inst., Troy, NY (United States). [1991]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER45362. Order Number DE93017019. Source: OSTI; NTIS; GPO Dep.

Progress was in two areas, materials preparation (Cl-doped CdS) and theory (anomalous paramagnetism/diamagnetism).

26788 (DOE/ER/45438–3) **Computer simulations for the adsorption of polymers onto surfaces: Progress report.** Balazs, A.C. Pittsburgh Univ., PA (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER45438. Order Number DE93016667. Source: OSTI; NTIS; GPO Dep.

Polymer-surface interactions are important in every stage of oil and coal production, production of new energy-efficient composite materials, and in medicine. Therefore, it is important to isolate the factors that influence the interfacial activity of polymer chains. We developed theoretical models and computer simulations to determine effects of polymer architecture, solvent quality, and surface morphology on properties of chains at penetrable and impenetrable interfaces. 7 figs, 27 refs.

26789 (DOE/FTR–93012413) **[Travel to the UK concerning semiconductor research]: Foreign trip report, 16 July–4 August 1992.** Dawson, L.R. Sandia National Labs., Albuquerque, NM (United States). 24 Aug 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012413. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Dr. Dawson presented an invited paper on the subject of "Applications of Narrow Gap Strained Layer Superlattices" at the 6th International conference on Narrow Gap Semiconductors held at the University of Southampton, Southampton, UK, on July 19–23, 1992. The attendance at this conference was approximately 175, principally from the UK and Europe. Approximately 140 papers were presented in the areas of growth, characterization, and theoretical aspects of a wide range of narrow energy gap semiconductor materials. Results from several of the more important papers are summarized.

26790 (DOE/OR/22014–1) **Failure models in continuous fiber ceramic composites: Phase 1, Task 1, State of the art survey: Continuous fiber ceramic composites program, Task 2, Supporting technologies.** Ostertag, C.P. (National Inst. of Standards and Technology, Gaithersburg, MD (United States)). National Inst. of Standards and Technology, Gaithersburg, MD (United States); Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States). [1991]. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-92OR22014 ;AC05-84OR21400. Order Number DE93016669. Source: OSTI; NTIS; GPO Dep.

The high toughness of continuous fiber reinforced composites (CFCCs) is due to increasing the thoughness by one or more of the following mechanisms: crack deflection, crack branching, crack bridging, microcracking, or fiber pullout. Most of the toughness, however, is attributed to work required to elastically elongate the bridging fibers and to pull the broken fibers out of the matrix. Understanding of matrix cracking mechanisms is important to the use of CFCCs. This survey concentrates on matrix cracking models established thus far that are based on continuous fiber-reinforced ceramic matrix composites with respect to both matrix crack initiation and matrix crack propagation. A review of experimental results relating material properties to the failure characteristics is included. 75 refs, 4 figs.

26791 (DOE/PC/91305–6) **Characterization of porosity via secondary reactions: Quarterly technical progress report, 1 January 1993–31 March 1993.** Calo, J.M.; Lu, W.; Zhang, L. Brown Univ., Providence, RI (United States). Div. of Engineering. [1993]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91305. Order Number DE93016697. Source: OSTI; NTIS; GPO Dep.

Temperature-programmed desorption spectra from steam-gasified chars were examined. At least two major CO-liberating features were identified for the resin char samples, one centered 1000 C and the other 1050 C. Presence of catalytic mineral matter appears to be related to the appearance of an additional low temperature feature for the Wyodak char. Although total amount of surface oxygen seems to be a gross indicator of reactivity, analysis of the desorption data assuming two different types of oxygen surface complexes, each exhibiting a single desorption activation energy, shows that the reactivity cannot be explained by the desorption rates of the complexes alone. 6 figs, 4 tabs, 9 refs.

26792 (EGG–10617-2186) **Growth of single crystals of mercuric iodide on the ground and in space.** van den Berg, L. EG

and G Energy Measurements, Inc., Goleta, CA (United States). Santa Barbara Operations. [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. (CONF-930405–21: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93015523. Source: OSTI; NTIS; GPO Dep.

A short review is given of the methods by which mercuric iodide is prepared and purified to obtain material suitable for the growth of single crystals. Method used in our laboratory to grow single crystals up to 1,000 grams in weight from the vapor is discussed. Effects of gravity on the growth process are described. A crystal growth system suitable for operation in the reduced gravity environment of space has been designed and crystal growth experiments have been performed during the flights of Spacelab 3 (April 1985) and the International Microgravity Laboratory (January 1992). Structural quality and electronic properties of ground-based and space-grown crystals are compared.

26793 (ENEA-RT-INN–91-27) **Composite Si/C/N powder production by laser induced gas phase reactions.** Borsella, E.; Botti, S.; Fantoni, R.; Alexandrescu, R.; Morjan, I.; Popescu, C.; Dikonimos-Makris, T.; Giorgi, R.; Enzo, S. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta; ENEA, Casaccia (Italy). Area Energia e Innovazione; Guam Office of Consumer Services, Agana (Guam). Aug 1991. 30p. (RT/INN–91-27). Order Number DE93799221. Source: OSTI; NTIS (US Sales Only).

Ultrafine amorphous Si/C/N ternary powders were prepared in a CO_2 laser assisted process. This paper demonstrates the possibility of driving the C/N ratio the powder by properly choosing the experimental conditions and the gaseous reactant ratio in the initial mixture containing silane, dimethylamine and ammonia. A kinetic model which accounts for reaching the equilibrium between the gaseous reaction intermediates and the solid products is proposed.

26794 (ENEA-RT-INN–91-40) **F center-molecular ion couples in alkali halides: Magneto-optics study (part two). Spin lattice relaxation time and electron spin memory.** Baldacchini, G.; Botti, S.; Grassano, U.M.; Luty, F. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta; Rome Univ. II (Italy). Dipt. di Fisica; Utah Univ., Salt Lake City, UT (United States). Dept. of Physics. Oct 1991. 46p. (In Italian). (RT/INN–91-40). Order Number DE93799296. Source: OSTI; NTIS (US Sales Only); INIS.

The spin-lattice relaxation time in the ground state, T_1, and the spin-mixing parameter during the optical cycle, epsilon, were measured in FH(OH) and FH(CN) centers in various alkali halides (KCl, KBr, KI, CsCl, and CsBr). For a close comparison, all experiments were performed before and after the optical association of the F center and molecular ion. T_1 becomes shorter before and still more after aggregation with respect to the values measured in the pure crystal, especially at very low magnetic fields. Epsilon decreases a little in crystals doped with OH-, while it increases a lot in crystals doped with CN-. Part of these results can be interpreted within the actual knowledge of the F-center physics. Part have been used to shed some light on the various unknown aspects of the energy transfer between the excited F-center and the molecular ion.

26795 (ETDE-IT–93-176) **ArF laser deposited tin oxide films studied by 'in situ' surface analysis techniques.** Larciprete, R.; Borsella, E.; De Padova, P.; Fanfoni, M.; Mangiatini, M.; Perfetti, P. ENEA, Frascati (Italy); Consiglio Nazionale delle Ricerche, Frascati (Italy); Rome Univ. II (Italy). Dipt. di Fisica. 1992. 8p. (CONF-9209307–2: International workshop on laser deposition of advanced materials, Tito (Italy), 28-30 Sep 1992). Order Number DE93799195. Source: OSTI; NTIS (US Sales Only).

Tin oxide films were deposited by ArF excimer laser induced photolysis of $Sn(CH_3)_4O_2$ mixtures. The 'in situ' Auger analysis technique was used to determine the effect of the gas phase O_2 concentration on the film composition. Synchrotron radiation induced UV photoemission spectroscopy was used to investigate the stoichiometry of films deposited irradiating $Sn(CH_3)_4$ diluted in large excess of oxygen. The samples were transferred to the synchrotron radiation facility without any exposure to air and kept in dynamical high vacuum. The results obtained showed that the valence band spectrum was characteristic for SnO_2 and that the 4d Sn core peak did not have any contribution due to metallic tin. The presence of oxygen vacancies was indicated by the weak emission in the band gap region; however, by tuning the synchrotron radiation wavelength, it was noted that these defects were localized at the sample surface.

26796 (INIS-mf–13537) **Pretreatment of industrial phosphoric acid by Algerian filter-aids.** Mellah, A. (Centre de Developpement des Materiaux, Algiers (Algeria)); Setti, Louisa; Chegrouche, Salah. Secretariat d'Etat a la Recherche, Algiers (Algeria). Jan 1993. [11p.] (In French). Order Number DE93629234. Source: OSTI; NTIS (US Sales Only); INIS.

The present work involves the filtration of industrial phosphoric acid by different filter-aids such as kieselguhr, celite and bleaching clay. The retention of substances contained in wet phosphoric acid was determined using the three filter-aids. Thus, the phosphoric acid, obtained by filtration on kieselguhr has the same specifications as technical phosphoric acid produced by Rhone-Poulenc (France) as standard.

26797 (INIS-mf–13546, pp. 86-91) **X-ray effects and swelling of some non-metallic materials after neutron irradiations.** Kosenkov, V.M. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (Russian Federation)). AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 7.* [226p.] Order Number DE93630373. Source: OSTI; NTIS (US Sales Only); INIS.

Crystal-chemical aspects of molecular (atomic) volume measured by X-ray method are considered. The volume increase in diamond, beryllium oxide and boron carbide up to 16% is accompanied by appearance of diffusive maximums at X-ray diagrams. There are structural transitions not accompanied by diffraction lines broadening with increase or decrease of molecular volume in double oxide compounds Gd_2O_3 with aluminium, titanium, molybdenum oxides. Vital factor in volume change is establishment of new relations among atoms in the local lattice regions or in the whole crystal volume. 4 refs.; 6 figs. (author).

26798 (INIS-mf–13547, pp. 68-76) **Radiation stability or absorbing compositions with a pyrocarbon binder.** Zelenskij, V.F. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. Nizkikh Temperatur); Gurin, V.A.; Konotop, Yu.F.; Kuprienko, V.A.; Samsonov, B.V.; Aksenov, N.A.; Ryakhovskikh, V.I. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

Various high temperature gas cooled reactor absorbers on the basis of boron carbide prepared by the method of volumetric gas-phase pyrocarbonization of porous media are described in short. The results of radiation tests of absorbing materials are presented. Behaviour of boron carbide absorbers with a pyrocarbon bond under neutron irradiation is discussed. 10 refs.; 4 figs.; 2 tabs. (author).

26799 (INIS-mf–13547, pp. 83-90) **Change of carbon fibre structure and properties under low-temperature neutron irradiation.** Kuznetsov, D.A. (Nauchno-Issledovatel'skij Institut Grafit, Moskva (Russian Federation)); Kurolenkin, E.I.; Virgil'ev, Yu.S.; Kostikov, V.I.; Shevenkova, N.V. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

The structure and properties of PAN-based carbon fibers (CF) heat-treated in the range of 1600-3100 K neutron irradiated at 340-360 K at fluence up to 4.8×10^{20} n/cm^2 ($E \geq 0.18$ MeV) in an aqueous medium have been investigated. It is shown that the irradiation has resulted in 10-15% increase of the interlayer space and about two-times decrease of the texture X-ray index, as well as in the change of geometric dimensions and density. There occurred the decrease of dynamic modulus by 45%, the increase of strength by 5 times; elastic deformation - by 3 times; electric resistivity -

more than 7 times. An explanation of the effects observed is suggested. 9 refs.; 3 tabs. (author).

26800 (INIS-mf–13547, pp. 91-97) **Irradiation property changes in the structural graphites at 1500-2000^{0}C.** Ashrapov, T.B. (AN Uzbekskoj SSR, Tashkent (Uzbekistan). Inst. Yadernoj Fiziki); Rasulkulov, Kh.M.; Khanbekov, R.G.; Virgil'ev, Yu.S.; Kalyagina, I.P.; Shurshakova, T.N. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

The results of the irradiation tests at high temperatures (1500 to 2000^{0}C) to fluence near 2x10^{20}n/cm^2 of various kinds of structural graphites (including poor-graphitized ones) are presented. The shrinkage in the order of 0.2% the increase of Young's modulus by 15%, the decrease of resistivity by 10% in graphites (treated to a final temperatures of 2300^{0}C or higher) have been established. The shrinkage by 1% and the intensive decrease of resistivity by 90% in poor-graphitized graphites are interpreted as irradiation induced ordering of a crystalline structure. 3 refs.; 1 fig.; 3 tabs. (author).

26801 (INIS-mf–13547, pp. 197-206) **Radiation damage of boron containing materials.** Bajramashvili, I.A. (Institut Stabil'nykh Izotopov, Tbilisi (Georgia)); Guldamashvili, A.I.; Gogishvili, V.A. AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1990. (In Russian). (CONF-9005247–: International conference on radiation material science, Alushta (USSR), 22-25 May 1990). In *Radiation materials science. V. 8.* [232p.] Order Number DE93630368. Source: OSTI; NTIS (US Sales Only); INIS.

Irradiation and testing of high boron-containing materials at room temperature is accompanied by relative decrease of their microhardness. Loosening of crystals irradiated with various ions is associated with the decrease of brittle failure threshold due to the accumulation of radiation defects of interstitial type mainly. When boron, boron carbide and aluminium dodecaboride were irradiated with helium and boron ions of similar ability of target composition change, helium ion with lower displacement rate provided higher loosening effect than boron ion due to formation of highly stable helium - vacancy complexes. 18 refs.; 2 tabs. (author).

26802 (IVO-A–10/92) **Effect of size, shape and end condition of test specimen on compressive strength of high-strength concrete.** Ipatti, A. Imatran Voima Oy (IVO), Helsinki (Finland). 1992. 50p. Order Number DE93500412. Source: OSTI; NTIS.

Compressive testing of high-strength concrete is a critical issue on which no consensus has yet been reached. Among the many factors that are mostly under discussion are the size, shape and end condition of test specimens for high-strength concrete. The experimental program described herein was designed primarily to investigate the effects and the possible interactions of the abovementioned factors on compressive strength of high-strength concrete. Three levels of specimen sizes, three methods of specimen capping (mould surface, sulphur capping, grinding) and four grades of concrete strengths were selected. A 3x3x4 factorial experimental design was adopted with two replicates (each an average of three specimens), giving a total of 72 test values (216 specimen). The strictest possible precautions were taken to ensure that all other factors which would conceivably effect the compressive strength were held constant. The statistical methods utilized included analyses of variance, linear regressions and pairwise comparisons of factor main effects.

26803 (LA-UR–93-1322) **Ceramic matrix composites by microwave assisted CVI.** Currier, R.P.; Devlin, D.J. Los Alamos National Lab., NM (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930438–14: 95. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 18-22 Apr 1993). Order Number DE93012640. Source: OSTI; NTIS; GPO Dep.

Chemical vapor infiltration (CVI) processes for producing continuously reinforced ceramic composites are reviewed. The potential advantages of microwave assisted CVI are noted. Recent numerical studies of microwave assisted CVI are then reviewed. These studies predict inverted thermal gradients in fibrous ceramic preforms subjected to microwave radiation and suggest processing strategies for achieving uniformly dense composites. Comparisons are made to experimental results obtained using silicon based composite systems. The importance of microwave-material interactions is stressed. In particular, emphasis is placed on the role played by the relative ability of fiber and matrix to dissipate microwave energy. Results suggest that microwave induced inverted gradients can in fact be exploited using the CVI technique to promote inside-out densification.

26804 (LA-UR–93-1657) **Small-angle scattering, contrast variation and the study of complex composite materials: A study of the structure of carbon black.** Hjelm, R.P. Jr. (Los Alamos National Lab., NM (United States)); Seeger, P.A.; Wampler, W.A. Los Alamos National Lab., NM (United States). [1993]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9305185–1: American Chemical Society meeting on rubber chemistry and technology, Denver, CO (United States), 18-22 May 1993). Order Number DE93012707. Source: OSTI; NTIS; INIS; GPO Dep.

Detailed studies are presented on the structure and aggregation of an experimental high surface area carbon black (HSA) using small-angle neutron scattering and the method of contrast variation. We find that the approximately 27 mn HSA particle form small, linear aggregates of average aggregation number 5 when suspended in cyclohexane. There is considerable density fluctuation in the interior of these particles, with the denser regions being toward the outer part of the spherically-averaged structure. This information would not have been obtained from studies of carbon black without solvent. The results will be applied to similar scattering studies on solvent-swollen bound rubber gels made from HSA-polyisoprene. These result show, however, that the strong internal fluctuations of the carbon black will limit the information that can be obtained on the structure and conformation of the elastomer in the gel. There are additional limitation from compositional heterogeneity of the sample.

26805 (LA-UR–93-1710) **Dynamic mechanical deformation of a SiC$_p$/Al-Li (8090) composite.** Vaidya, R.U.; Zurek, A.K. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9306167–2: 14. international conference on high pressure science and technology and 1993 technical meeting of the topical group on shock compression of condensed matter, Colorado Springs, CO (United States), 28 Jun - 3 jul 1993). Order Number DE93014586. Source: OSTI; NTIS; GPO Dep.

The deformation behavior in compression of a silicon carbide particle-reinforced aluminum-lithium (8090) matrix composite, at strain rates in the range of 10^{-3} to 6500 s^{-1}, was investigated, and compared with that of unreinforced alloy samples. Dynamics strengthening in these composites was found to change depending on the direction of testing. These differences were attributed to differences in the orientation of the reinforcing particles. 4 refs, 5 figs.

26806 (LA-UR–93-1711) **Measurement of strain in individual phases of composites before, during, and after mechanical loading.** Goldstone, J.A. (Los Alamos National Lab., NM (United States)); Bourke, M.A.M.; Shi, Ning; Lawson, A.C.; Allison, J.E. Los Alamos National Lab., NM (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9305177–5: 12. International collaboration of advanced neutron sources meeting (ICANS), Abingdon (United Kingdom), 24-28 May 1993). Order Number DE93014585. Source: OSTI; NTIS; GPO Dep.

At LANSCE, we have measured residual strains in a variety of metal-matrix systems using the Neutron Powder Diffractometer (NPD). In 1992, we developed a compact stress rig for in-situ strain measurement during applied loading. Comparison of experimental measurements made with the stress rig on aluminum titanium carbide with numerical predictions showed the importance of including initial thermal residual strains in the models. In Al/TiC, normal to the loading direction, the increase in the average matrix and reinforcement lattice strains was in a "zigzag" manner. Finite element modeling indicated that this resulted from residual strains

induced during cooling from fabrication temperatures. Data and modeling are presented. 16 refs, 5 figs.

26807 (LA-UR–93-1927) **The structure and mechanical properties of Ru-Cu and Ru-Ti nanolayer composites.** Kung, H. (Los Alamos National Lab., NM (United States)); Nastasi, M.; Jervis, T.R.; Hubbard, K.; Mitchell, T.E.; Messner, R.M.; Embury, J.D. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930405–15: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93014453. Source: OSTI; NTIS; GPO Dep.

Multilayers of Ru-Cu and Ru-Ti have been prepared by electron beam evaporation technique. One set of composites has Ru thickness varying from 250 to 2500Å alternating with Cu or Ti of 15Å. The other set has 250Å of Ru and the Cu or Ti layer varies between 15 and 200Å. Nanoindentation measurements show that there is no significant change in hardness as either Ru or Cu/Ti thickness varies. However, the Ru-Cu multilayer has twice the hardness of the Ru-Ti system. The strengthening mechanism proposed by Koehler predicts that Ru-Ti composites would have a higher strength than Ru-Cu due to larger modulus difference between Ru and Ti. Discrepancy between prediction and experiment suggests that other strengthening mechanism(s) may be operating. We have proposed two models based on a "shear" mechanism to explain the differences observed between these two systems. Effects of these mechanisms in controlling the deformation process in nanolayer composites are discussed.

26808 (MHSMP–93-08) **Compatibility testing of vacuum seal materials.** Foster, P.A.; Rodin, W.A. Mason and Hanger-Silas Mason Co., Inc., Amarillo, TX (United States). May 1993. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL65030. Order Number DE93014366. Source: OSTI; NTIS; GPO Dep.

Small scale materials compatibility testing was conducted for three elastomers considered for use as vacuum seal materials; Adiprene MOCAcured, Adiprene Cyanacured, and Sylgard silastic rubber. The tests were conducted using orthogonal array designed experiments for each of the elastomers placed in contact with three materials commonly used during weapon disassembly operations: Duxseal, Sylgard 186 grease, and 2-propyl alcohol. The test results indicated that only the 2-propyl alcohol had a significant effect on the elastomer hardness and physical properties. The alcohol had the largest effect on the two Adiprene materials, with the silastic rubber being the least affected.

26809 (NUTEK-FBT–93-8) **Textile filters for dust separation.** Edberg, B. (Chalmers Univ. of Technology, Gothenburg (Sweden). Dept. of Textile Technology); Stroem, L.; Johansson, B.; Nilsson, R. Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). 1993. 28p. (In Swedish). Project NUTEK-279-498. Order Number DE93500731. Source: OSTI; NTIS.

Needled textile filters have a recognized high separation efficiency. There are still problems concerning availability and service life. Wear and burns occur frequently, probably caused by thermal and mechanical overload, at least locally and temporary. In an attempt to analyse the thermal, mechanical and chemical degradation of the textile filters, the parameter temperature has been studied during operation of a 10 MW power plant, burning wood chips in a fluidized bed. The filter bags were made of meta-aramide fibres, with a base fabric of PTFE. The temperature variations were measured during 110 days. The mechanical properties of new and used filter bags were tested in the laboratory. The natural degradation of the properties was established. By using a load integral the thermal degradation of the strength based on day 65 to 113 was calculated. This resulted in a predicted strength of 89% of new material. Mechanical wear reduced the area weight by about 10%, estimated to give a further strength reduction of the same percentage. The tested diagonal breaking strength was 68%. This indicates that thermal degradation to some extent can be predicted. The obtained data is, however, not sufficient to verify a service life algorithm. Felt swelling and fibre loss are important parameters presently without proper expressions. A study going deeper into filter experience and the ageing properties of polymers, both in theory and practice, would be necessary. (22 figs., 1 tab.).

26810 (OEFZS–4623) **Preliminary experiments for measuring Kd values for cesium and strontium. To be used in site evaluations.** Benischek, I. (Hauptabteilung Entsorgungstechnik, Bereich Umwelt- und Verfahrenstechnik, Forschungszentrum Seibersdorf, Seibersdorf (Austria)); Hess, V.; Metzker, E. Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Mar 1992. [55p.] (In German). Order Number DE93627893. Source: OSTI; NTIS (US Sales Only); INIS.

In an underground dump not only technolgical barriers but also the natural geological formations are efficient in withholding radionuclides. Sites are to be chosen where the rocks have good sorption properties and where transportation due to various chemical interactions should be minimal. Minerals obtained from deep drilling - granodiorite, mylonite and granit gneis - were investigated. The liquid phase (cement leaching water) contained different amounts of cesium 137 and strontium 85. Details of the experiments and results are given.

26811 (OEFZS–4631) **Preliminary experiments for determining Kd values for cesium and strontium as part of site selection. Pt. 2: Experiments with clay materials.** Benischek, I. (Hauptabteilung Entsorgungstechnik, Bereich Umwelt- und Verfahrenstechnik, Forschungszentrum Seibersdorf, Seibersdorf (Austria)); Hess, V.; Metzker, E. Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Jun 1992. [29p.] (In German). Order Number DE93627894. Source: OSTI; NTIS (US Sales Only); INIS.

To obtain Kd values to be used in the safety analyses for radioactive waste dumps experiments were done with clays and bentonite. Cesium and strontium concentrations were varied from 10^{-3}M to 10^{-5}M, temperatures between 20 deg C and 80 deg C. Natural as well as activated bentonites were investigated. Different methods of measuring the cation exchange capacity were applied.

26812 (PNL-SA–21693) **Environmental effects on elevated temperature subcritical crack growth of SIC/SIC composites.** Henager, C.H. Jr.; Jones, R.H. Pacific Northwest Lab., Richland, WA (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930317–1: Conference on critical issues in the development of high temperature structural materials, Kona, HI (United States), 7-12 Mar 1993). Order Number DE93015688. Source: OSTI; NTIS; GPO Dep.

Time-dependent crack growth measurements of ceramic composites in varying environments were conducted on materials consisting of chemical vapor infiltrated SiC reinforced with Nicalon fibers having C-interfaces. Crack velocities are determined as a function of applied stress intensity and time for varying O_2 levels. Results are presented for crack velocity/stress intensity relationships in pure Ar and in Ar plus 2000-, 5000-, 10,000-, and 20,000-ppM O_2 atmospheres at 1100C. A 2D micromechanics model is used to represent the time-dependence of observed crack bridging events and to rationalize the observed phenomena.

26813 (SAND–92-2867C) **Characteristics of HEM silicon produced in a reusable crucible.** Khattak, C.P. (Crystal Systems, Inc., Salem, MA (United States)); Schmid, F.; Schubert, W.K.; Cudzinovic, M.; Sopori, B.L. Sandia National Labs., Albuquerque, NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930540–6: 23. Institute of Electrical and Electronics Engineers (IEEE) photovoltaic specialists conference, Louisville, KY (United States), 10-14 May 1993). Order Number DE93015025. Source: OSTI; NTIS; GPO Dep.

A reusable crucible has been developed for directional solidification of multicrystalline silicon ingots by HEM. Up to five 40 kg, 33 cm square cross section ingots have been produced without visible degradation of the crucible. Characterization of the silicon shows large grain size, vertical orientation of grain boundaries, uniform resistivity, low defect density, diffusion lengths up to 272 μm and less than 1 ppma oxygen concentration. Solar cells of 2 cm x 2 cm size fabricated on 10 cm square wafers have shown good uniformity and efficiencies up to 15.1% and V_{oc} to 616 mV.

26814 (SAND–93-0300C) **The growth of $InAs_{1-x}Sb_x$/InAs strained-layer superlattices by metal-organic chemical vapor deposition.** Biefeld, R.M.; Baucom, K.C.; Kurtz, S.R. Sandia National Labs., Albuquerque, NM (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930851–1: 9. American conference on crystal growth: crystal growth, characterization and applications, Baltimore, MD (United States), 1-6 Aug 1993). Order Number DE93015028. Source: OSTI; NTIS; GPO Dep.

$InAs_{1-x}Sb_x$/InAs strained-layer superlattice (SLS) semiconductors and thick epitaxial layers of $InAs_{1-x}Sb_x$ were grown under a variety of conditions by metal-organic chemical vapor deposition on InAs substrates. The III/V ratio was varied from 0.026 to 1.0 over a temperature range of 475–525C, at pressures of 200 to 660 torr and growth rates of 0.75 to 3.0 μm/hour. The composition of the ternary can be predicted from the input gas molar flow rates using a thermodynamic model. At lower temperatures, the thermodynamic model must be modified to take account of the incomplete decomposition of arsine and trimethylantimony. These layers were characterized by optical microscopy, SIMS, and x-ray diffraction. The optical properties of these SLS's were determined by infrared photoluminescence and absorption measurements. The PL peak energies of the alloys' and the SLS's are consistently lower than the previously reported values for the bandgap of $InAs_{1-x}Sb_x$ alloys.

26815 (SAND–93-0304C, pp. 2, Paper 3) **Interface configurations of $Al_xGa_{1-x}As$/GaAs quantum wells probed by photoluminescence spectroscopy.** Schubert, E.F.; Kopf, R.F.; Harris, R.D. Sandia National Labs., Albuquerque, NM (United States). [1993]. (CONF-921101–108: 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting, Boston, MA (United States), 30 Nov - 5 dec 1992). In *Interface roughness: What is it and how is it measured?*. 35p. Order Number DE93009797. Source: OSTI; NTIS.

Low-temperature photoluminescence measurements have been widely used to probe interface configurations in III-V semiconductor quantum well structures, including the $Al_xGa_{1-x}As$/GaAs material system. This presentation describes how these photoluminescence measurements are performed. The authors also address the question of the length-scale of the optical probe. Experimental evidence and comparisons with experimental results from other techniques are given in support of their arguments.

26816 (SAND–93-0304C, pp. 5, Paper 4) **Roughness at chemical heterointerfaces: Definition and measurement.** Ourmazd, A.; Warwick, C.A. Sandia National Labs., Albuquerque, NM (United States). [1993]. DOE Contract AC04-76DP00789. Contract AFOSR-90-0140;Contract F-49620-91-C-0009. (CONF-921101–108: 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting, Boston, MA (United States), 30 Nov - 5 dec 1992). In *Interface roughness: What is it and how is it measured?*. 35p. Order Number DE93009797. Source: OSTI; NTIS.

Heterointerfaces are complex two-dimensional objects, with undulations on many length scales. Interfaces are best described in terms of roughness spectra, specifying the amount of roughness at each length scale. This discussion is restricted to "chemical"heterointerfaces, such as GaAs/AlAs, across which only the composition changes. Although qualitative data on roughness at heterointerfaces exists, quantitative correlations are largely absent. This presentation briefly outlines how the properties of interfaces may be determined experimentally.

26817 (SAND–93-0725C) **A multiphase model for shock-induced flow in low density foam.** Baer, M.R. Sandia National Labs., Albuquerque, NM (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930788–1: 19. international symposium on shock waves, Marseille (France), 26-30 Jul 1993). Order Number DE93013767. Source: OSTI; NTIS; GPO Dep.

A multiphase mixture model is applied to describe shocked-induced flow in deformable low-density foam. This model includes interphase drag and heat transfer and all phases are treated as compressible. Volume fraction is represented as an independent kinematic variable and the entropy inequality suggests a thermodynamically-admissable evolutionary equation to describe rate-dependent compaction. This multiphase model has been applied to shock tube experiments conducted by B. W. Skews and colleagues in the study of normal shock impingement on a wall-supported low density porous layer. Numerical solution of the multiphase flow equations employs a high resolution adaptive finite element method which accurately resolves contact surfaces and shock interactions. Additional studies are presented in an investigation of the effect of initial gas pressure in the foam layer, the shock interaction on multiple layers of foam and the shock- induced flow in an unsupported foam layer.

26818 (SAND–93-1324C) **Sidewall thermometry perturbations to nonlinear heat transport near the λ transition in ^{4}He.** Duncan, R. (Sandia National Labs., Albuquerque, NM (United States)); Akau, R.; Gianoulakis, S.; Israelsson, U.; Chui, T. Sandia National Labs., Albuquerque, NM (United States). [1993]. 2p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930801–3: Conference of the International Union of Pure and Applied Physics on low temperature physics (LT 20), Eugene, OR (United States), 1-11 Aug 1993). Order Number DE93014990. Source: OSTI; NTIS; GPO Dep.

The effect of a sidewall thermometry probe on heat transport measurements in liquid ^{4}He very close to the superfluid transition is simulated numerically. The effective thermal position of the probe changes with closeness of approach to the superfluid transition. The radial heat flux induced by the sidewall probe is calculated for specific probe designs.

26819 (SLAC-PUB–6078) **Photoemission study of diamond (100) surface.** Wu, J.; Cao, R.; Yang, X.; Pianetta, P.; Lindau, I. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (SLAC/SSRL–0015;CONF-921129–10. 39. national symposium of the American Vacuum Society, Chicago, IL (United States), 9-13 Nov 1992). Order Number DE93015251. Source: OSTI; NTIS; INIS; GPO Dep.

The electronic structure of the diamond C(100)-(2 × 1)/(2 × 2) has been investigated by means of angle-resolved photoelectron spectroscopy for the first time. A surface-related shift has been observed in the C 1s core level spectrum. The surface-state band dispersion was measured along the symmetry axis Γ-J' in the surface Brillouin zone. For $k_{||} = 0$, there is a very pronounced surface state 1.5 eV below Fermi level E_F, and it disperses downwards with increasing $k_{||}$. Near the boundary of the surface Brillouin zone J', we find two states with binding energies of 1.9 and 2.4 eV with respect to E_F.

26820 (SVF–463) **Lower operating temperature in district heating networks - field and laboratory measurements of the properties of cellular concrete insulation.** Molin, J. (ABB VIAK (Sweden)); Nilsson, Ronny. Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Dec 1992. 55 p.p. (In Swedish). Order Number DE93500706. Source: OSTI; NTIS.

Efforts by municipal heating authorities to reduce costs for production and distribution of district heating has in several cases caused a decrease of operating temperatures in district heating systems. A reduction of operating temperatures has been assumed to increase the risk of external corrosion of steel pipes in culverts where risks of water intrusion into the culvert is conceivable. In this report the result is given from field measurements of the temperature and the relative humidity (RH) in culvert with cellular concrete as insulation and from the determination of the humidity characteristics of the insulation. The determinations of the humidity characteristics are made in the laboratory. (9 refs., 21 figs., 4 tabs.).

26821 (UCRL-JC–107836) **High strain rate effects for composite materials.** Groves, S.E.; Sanchez, R.J.; Lyon, R.E.; Brown, A.E. Lawrence Livermore National Lab., CA (United States). 16 Apr 1992. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9205232–2: 11. American Society for Testing and Materials (ASTM) symposium on composite materials: testing and design, Pittsburgh, PA (United

States), 4-5 May 1992). Order Number DE93013087. Source: OSTI; NTIS; GPO Dep.

We have been developing the capability to characterize the high strain rate response of continuous fiber polymer composites. The data presented covers strain rates from 0/sec to 3000/sec. A combination of test machines and specimen geometries was investigated. Strain rates from 0–100/sec were generated using conventional and high speed hydraulic test machines. Strain rates from 10–1000/sec were generated using a high energy drop tower, and rates from 1000–3000/sec were generated using a split Hopkinson bar. Strain rates above 100/sec have only been generated for uniaxial compression. Our efforts have primarily focused on developing the high energy drop tower for these purposes. Specimen geometries for compression include tapered cubes, one inch tubes, and solid rods. For tension a smaller 0.5 in. diameter version of our 2.0 in. diameter multiaxial test specimen was developed and has been successfully used at strain rates up to 100 per second. Fixtures were also developed for performing high strain rate shear testing and through thickness penetration studies of composite plates. The objective of these experiments is to develop dynamic material models for use in finite element design tools. This presentation will focus on the methods and results obtained from this study.

26822 (UCRL-JC–111397) **Polished substrate surface and cleaning study for coated optic quality.** Tesar, A. (Lawrence Livermore National Lab., CA (United States)); Eickelberg, W.; Koons, K.; Davis, K. Lawrence Livermore National Lab., CA (United States). Nov 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9211104–9: OPTCON '92: optical fabrication and testing workshop, Boston, MA (United States), 17 Nov 1992). Order Number DE93014116. Source: OSTI; NTIS; GPO Dep.

The optical substrate-coating interface is established by (1) the original polished condition of the substrate; (2) the substrate cleaning process; and (3) the environment of the coating process. The substrate-coating interface affects the coating adhesion properties, is where most coating defects and scatter sites are thought to initiate, and in some instances may control the structure of the coating as it is deposited. Often features appear on an optic after coating which could not be observed after cleaning and prior to coating. Because of the wide variety of possible substrate materials, surface problems, and contaminants, cleaning processes are constantly evolving. Our study has clearly shown that the coating appearance is dependent not only on the cleaning method, but especially on the initial character of the substrate surface.

26823 (UCRL-JC–111977) **A zeroth order statistical model for fracture in rock in compression.** Blair, S.C. (Lawrence Livermore National Lab., CA (United States)); Cook, N.G.W.; Daveler, S.A. Lawrence Livermore National Lab., CA (United States). 6 Oct 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930644–5: 34. US symposium on rock mechanics, Madison, WI (United States), 27-30 Jun 1993). Order Number DE93009307. Source: OSTI; NTIS; GPO Dep.

Recent advances in computing power and percolation theory have led to the development of new statistical models for the fracture of heterogeneous materials, with promising preliminary results. However, application of these models to the field of rock mechanics has been limited because many of the models developed to date operate in a tensile stress field, whereas most of the rock mechanics applications involve compressive stresses. We have developed a statistical model that allows us to use the theoretical machinery of percolation theory to characterize rock fracture in compression. In this paper we describe a zeroth order model that incorporates disorder in the media due to variations in the shape and strength of individual grains, as well as heterogeneity in the local stress field due to cracks and excavations. We also present results of numerical experiments performed with the model; these were designed to evaluate the fundamental role that various types of disorder play in the fracture of rock.

26824 (UCRL-JC–112379) **The effect of process parameters on the surface finish of plasma polymers.** Letts, S.A.; Cook, R.C.; Welch, P.; McEachern, R.; Fearon, E. Lawrence Livermore National Lab., CA (United States). 9 Dec 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930304–22: 205. American Chemical Society national meeting, Denver, CO (United States), 28 Mar - 2 apr 1993). Order Number DE93014112. Source: OSTI; NTIS; INIS; GPO Dep.

The surface finish of plasma polymers deposited in an inductively coupled discharge were measured as a function of gas flow rates. Surface finish was measured both optically and by AFM. The process parameters of the plasma polymerization were found to effect the surface finish. The gases used were trans-2- butene and hydrogen for hydrocarbon polymers. For bromocarbon polymers we added ethylbromide. The smoothest hydrocarbon polymer coatings had an RMS surface finish better than 1 nm. Bumps 200 nm high spaced approximately 1 μm apart grew on the surface of bromocarbon coatings when they were exposed to air. The composition of the bumps was found to be NH_4Br by XRD and XPS analysis. We believe that nitrogen (from a small leak or desorption) dissociates in the discharge and reacts with hydrogen to form ammonia. The ammonia then reacts with HBr, a dissociation product of ethylbromide, to form NH_4Br which is dispersed throughout the deposited layer. Humidity facilitates the transport of the NH_4Br to the surface where it crystallizes. Bump growth was prevented by either dry storage or overcoating with 3 μm of hydrocarbon plasma polymer. Alternatively, the bumps could be washed from the surface with water.

26825 (UCRL-JC–112408) **Fracture behavior of vanadium/vanadium silicide in-situ composites.** Strum, M.J.; Henshall, G.A. Lawrence Livermore National Lab., CA (United States). 30 Nov 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921101–119: 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting, Boston, MA (United States), 30 Nov - 5 dec 1992). Order Number DE93013422. Source: OSTI; NTIS; GPO Dep.

The fracture behavior of V-V_3Si in-situ composite alloys has been evaluated for intermetallic phase fractions of 30, 50, and 70 volume percent. In addition, the mechanical properties of the ductile constituent in these composites have been evaluated from two alloys containing silicon at its solubility-limit in vanadium at the eutectic temperature and at 1400°C. The fracture toughness was found to increase monotonically with increasing volume fraction of ductile phase. Fractography has shown evidence of crack bridging by the vanadium solid solution phase and increased ductility within the composite relative to bulk measurements. The toughness results are compared with predictions based on an existing model of ductile-phase toughening using our measurements of component properties.

26826 (UCRL-JC–112521) **Activation and deactivation of high concentration arsenic with some evidence of precipitation.** Rousseau, P.M. (Stanford Univ., CA (US). Center for Integrated Systems); Griffin, P.B.; Plummer, J.D.; Carey, P.G. Lawrence Livermore National Lab., CA (United States). 29 Dec 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930571–21: 183. Electrochemical Society meeting, Honolulu, HI (United States), 16-21 May 1993). Order Number DE93016437. Source: OSTI; NTIS; GPO Dep.

Using box-shaped profiles created by laser melt annealing, the authors investigate the kinetics of arsenic activation and deactivation. They find deactivation shows no history effects, which can be consistent either with clustering or precipitation for the cases considered. For activation, they notice it occurs on very short time scales, followed by a slower deactivation process. This is suggestive evidence that at least some precipitation occurs.

26827 (UCRL-JC–112981) **Laser-damage susceptibility of nodular defects in dielectric mirror coatings: AFM measurements and electric-field modeling.** Kozlowski, M.R.; DeFord, J.F.; Staggs, M.C. Lawrence Livermore National Lab., CA (United States). 15 Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9304144–1: 2. international conference on laser ablation, Knoxville, TN

(United States), 19-22 Apr 1993). Order Number DE93014655. Source: OSTI; NTIS; INIS; GPO Dep.

Atomic force microscopy (AFM) and electromagnetic field modeling were used to study the influence of nodular coating defects on laser-induced damage of multilayer dielectric coatings. In studies of HfO_2/SiO_2 mirrors with 1.06 μm illumination, AFM results showed that nodular defects with high dome heights (>0.6 μm) were most susceptible to laser damage. Crater defects, formed by nodules ejected from the coating prior to illumination, were not damaged when illuminated over the same range of fluences. A finite-difference time-domain electromagnetic modeling code was used to study the influence of 3-D nodule defects on the E-field distribution within the interference coating. The modeling results show that En-field enhancements as large as a factor of 4 can be present at the defects. Crater defects, however, result in minimal enhancement of the E-fields within the coating. These modeling results are consistent with the AFM experimental data, indicating that E-field enhancement is a contributing mechanism in defect-dominated laser damage of optical coatings.

26828 (Y/EN–4909) **Large-scale testing of structural clay tile infilled frames.** Flanagan, R.D. (Oak Ridge Y-12 Plant, TN (United States)); Bennett, R.M. Oak Ridge Y-12 Plant, TN (United States). 18 Mar 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. (CONF-930769–2: 1993 joint Canadian Society of Civil Engineers-American Society of Civil Engineers (CSCE-ASCE) national conference on environmental engineering, Montreal (Canada), 12-14 Jul 1993). Order Number DE93011837. Source: OSTI; NTIS; GPO Dep.

A summary of large-scale cyclic static tests of structural clay tile infilled frames is given. In-plane racking tests examined the effects of varying frame stiffness, varying infill size, infill offset from frame centerline, and single and double wythe infill construction. Out-of-plane tests examined infilled frame response to inertial loadings and inter-story drift loadings. Sequential in-plane and out-of-plane loadings were performed to determine the effects of orthogonal damage and degradation on both strength and stiffness. A combined out-of-plane inertial and in-plane racking test was conducted to investigate the interaction of multi-directional loading. To determine constitutive properties of the infills, prism compression, mortar compression and various unit tile tests were performed.

25829 (LBL–32387) **[Lawrence Berkeley Laboratory] Chemical Sciences Division annual report 1991.** Lawrence Berkeley Lab., CA (United States). Sep 1992. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015260. Source: OSTI; NTIS; GPO Dep.

Summaries are given of research in the following fields: photochemistry of materials in stratosphere, energy transfer and structural studies of molecules on surfaces, laser sources and techniques, crossed molecular beams, molecular interactions, theory of atomic and molecular collision processes, selective photochemistry, photodissociation of free radicals, physical chemistry with emphasis on thermodynamic properties, chemical physics at high photon energies, high-energy atomic physics, atomic physics, high-energy oxidizers and delocalized-electron solids, catalytic hydrogenation of CO, transition metal-catalyzed conversion of CO, NO, H_2, and organic molecules to fuels and petrochemicals, formation of oxyacids of sulfur from SO_2, potentially catalytic and conducting organometallics, actinide chemistry, and molecular thermodynamics for phase equilibria in mixtures. Under exploratory R and D funds, the following are discussed: technical evaluation of beamlines and experimental stations for chemical cynamics applications at the ALS synchrotron, and molecular beam threshold time-of-flight spectroscopy of rare gas atoms. Research on normal and superconducting properties of high-T_c systems is reported under work for others. (DLC)

26830 (UCID–20622-92-2) **Chemistry and materials science progress report: Second half, FY 1992.** Sugihara, T.T. Lawrence Livermore National Lab., CA (United States). Mar 1993. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014364. Source: OSTI; NTIS; GPO Dep.

The research reported here in summary form was conducted under the auspices of weapons-supporting research (WSR) and laboratory directed R and D. Work funded by WSR is organized into 3 categories: thrust areas, research groups, and a few small projects led by individual investigators. The thrust areas were fundamentals of physics and processing of metals; interfaces, adhesion, and bonding; energetic materials; plutonium research; and synchrotron radiation-based materials science. Separate abstracts have been prepared.

26831 (ANL/ACL–92/4) **Analytical Chemistry Laboratory progress report for FY 1992.** Green, D.W.; Heinrich, R.R.; Graczyk, D.G.; Lindahl, P.C.; Boparai, A.S.; Bass, D.A. Argonne National Lab., IL (United States). Dec 1992. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93014902. Source: OSTI; NTIS; INIS; GPO Dep.

The ACL activities covered IFR fuel reprocessing, corium-concrete interactions, environmental samples, wastes, WIPP support, Advanced Photon Source, H-Tc superconductors, EBWR vessel, soils, illegal drug detection, quality control, etc.

26832 (ANL/CHM/CP–75734) **Novel extraction chromatographic materials for the separation and preconcentration of radionuclides.** Dietz, M.L.; Horwitz, E.P.; Chiarizia, R.; Diamond, H. Argonne National Lab., IL (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930945–3: International solvent extraction conference (ISEC '93), York (United Kingdom), 9-15 Sep 1993). Order Number DE93002899. Source: OSTI; NTIS; GPO Dep.

New chromatographic methods have been developed to separate and preconcentrate the actinide elements and radiostrontium from a variety of biological and environmental samples. Several of these methods involve the use, in an extraction chromatographic mode, of a chemical system originally devised for the removal of various radionuclides from acidic, high-level nuclear waste solutions. For the isolation of actinides, for example, a solution of the sample in nitric acid is passed through a column containing a solution of CMPO in tributyl phosphate (the basis of the well-known TRUEX process) sorbed on an inert polymeric substrate. Isolation of radiostrontium is accomplished by passing a sample solution, again in nitric acid, through a column containing a polymeric support impregnated with an octanol solution of di-t-butylcyclohexano-18-crown-6 (the basis of the SREX process for strontium removal from nuclear wastes). Sorbed strontium can be eluted with dilute nitric acid and counted via liquid scintillation. A variety of applications of these and other related materials to the analysis of environmental and biological samples are described.

26833 (ANL/ER/CP–77861) **Procurement and execution of PCB analyses: Customer-analyst interactions.** Erickson, M.D. Argonne National Lab., IL (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9303123–1: 5. international conference for the remediation of PCB contamination, Houston, TX (United States), 15-16 Mar 1993). Order Number DE93009964. Source: OSTI; NTIS; INIS; GPO Dep.

The practical application of PCB (polychlorinated biphenyl) analyses begins with a request for the analysis and concludes with provision of the requested analysis. The key to successful execution of this iteration is timely, professional communication between the requester and the analyst. Often PCB analyses are not satisfactorily executed, either because the requester failed to give adequate instructions or because the analyst simply "did what he/she was told." The request for and conduct of a PCB analysis represents a contract for the procurement of a product (information

about the sample); if both parties recognize and abide by this contractual relationship, the process generally proceeds smoothly. Requesters may be corporate purchasing agents working from a scope of work, a sample management office, a field team leader, a project manager, a physician's office, or the analyst himself. The analyst with whom the requester communicates may be a laboratory supervisor, a sample-receiving department, a salesperson for the laboratory, or the analyst himself. The analyst conducting the analysis is often a team, with custody of the sample being passed from sample receiving to the extraction laboratory, to the cleanup laboratory, to the gas chromatography (GC) laboratory, to the data reduction person, to the package preparation person, to the quality control (QC) department for verification, to shipping. Where a team of analysts is involved, the requester needs a central point of contact to minimize confusion and frustration. For the requester-analyst interface to work smoothly, it must function as if it is a one-to-one interaction. This article addresses the pitfalls of the requester-analyst interaction and provides suggestions for improving the quality of the analytical product through the requester-analyst interface.

26834 (ANL/MSD/CP–78019) **New techniques for synchrotron powder diffraction studies.** Knapp, G.S.; Beno, M.A.; Jennings, G.; Ramanathan, M. Argonne National Lab., IL (United States). Apr 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930405–16: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93015136. Source: OSTI; NTIS; INIS; GPO Dep.

This manuscript discusses two different powder diffraction methods which possess high resolution, low background and very high counting rates. Both methods utilize analyzer crystals in combination with position sensitive detectors. The first method uses a curved perfect crystal analyzer diffracting in the scattering plane to diffract a range of angles into the position sensitive detector. The second method is somewhat simpler, it uses a graphite analyzer crystal diffracting out of the scattering plane. Applications of these methods to anomalous scattering from both powder and amorphous materials are also discussed. One of the techniques should also be very useful for small angle scattering.

26835 (BNL–48580) **Monitoring and trace detection of hazardous waste and toxic chemicals using resonance Raman spectroscopy.** Sedlacek, A.J. III; Dougherty, D.R.; Chen, C.L. Brookhaven National Lab., Upton, NY (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930257–4: 3. international symposium of field screening methods for hazardous wastes and toxic chemicals, Las Vegas, NV (United States), 24-26 Feb 1993). Order Number DE93010880. Source: OSTI; NTIS; INIS; GPO Dep.

Raman scattering is a coherent, inelastic, two-photon process, which shifts the frequency of an outgoing photon according to the vibrational structure of the irradiated species, thereby providing a unique fingerprint of the molecule. When involving an allowed electronic transition (resonance Raman), this scattering cross section can be enhanced by 10^4 to 10^6 and provides the basis for a viable technique that can monitor and detect trace quantities of hazardous wastes and toxic chemicals. Resonance Raman spectroscopy (RRS) possesses many of the ideal characteristics for monitoring and detecting of hazardous waste and toxic chemicals. Some of these traits are: (1) very high selectivity (chemical specific fingerprints); (2) independence from the excitation wavelength (ability to monitor in the solar blind region); (3) chemical mixture fingerprints are the sum of its individual components (no spectral cross-talk); (4) near independence of the Raman fingerprint to its physical state (very similar spectra for gas, liquid, solid and solutions – either bulk or aerosols); and (5) insensitivity of the Raman signature to environmental conditions (no quenching). Data from a few chemicals will be presented which illustrate these features. In cases where background fluorescence accompanies the Raman signals, an effective frequency modulation technique has been developed, which can completely eliminate this interference.

26836 (BNL–48887) **Ultra-soft x-ray absorption spectroscopy: A bulk and surface probe of materials.** Fischer, D.A. (National Institute of Standards and Technology, Gaithersburg, MD (United States)); Mitchell, G.E.; Dekoven, B.M.; Yeh, A.T.; Gland, J.L.; Moodenbaugh, A.R. Brookhaven National Lab., Upton, NY (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930405–12: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93014325. Source: OSTI; NTIS; GPO Dep.

Direct comparisons between surface and bulk of diverse materials can be made by simultaneous electron yield (5 nm depth sensitivity) and fluorescence yield (200 nm) ultra soft x-ray absorption spectroscopy measurements utilizing a rapid sample interchange apparatus. For example the orientations of functional groups have been characterized at and near the surface of a series of model polymeric materials highlighting the chemical and molecular sensitivity of ultra soft x-ray absorption spectroscopy. In addition we discuss a bulk sensitive use of fluorescence yield to non destructively study a buried metal polymer interface. A second bulk sensitive example is the use of fluorescence yield oxygen K near edge x-ray spectroscopy as a method to determine the hole state density of high Tc materials.

26837 (CEAC-R–1-93) **Automatization of the neutron activation analysis method in the nuclear analysis laboratory.** Gonzalez, N.R. (Instituto Superior de Ciencia y Tecnologia Nuclear (ISCTN), La Habana (Cuba)); Rivero, D del C.; Gonzalez, M.A.; Larramendi, F. Instituto Superior de Ciencia y Tecnologia Nuclear (ISCTN), La Habana (Cuba); Centro de Estudios Aplicados al Desarrollo Nuclear (CEADEN), La Habana (Cuba). 1993. [7p.] (In Spanish), Order Number DE93630289. Source: OSTI; NTIS (US Sales Only); INIS.

In the present paper the work done to automatice the Neutron Activation Analysis technic with a neutron generator is described. An interface between an IBM compatible microcomputer and the equipment in use to make this kind of measurement was developed. including the specialized software for this system.

26838 (CONF-921101–125) **Application of Z-contrast imaging to obtain column-by-column spectroscopic analysis of materials.** Browning, N.D.; Pennycook, S.J. Oak Ridge National Lab., TN (United States). Jan 1993. 7p. Sponsored by USDOE, Washington, DC (United States); Oak Ridge Inst. for Science and Education, TN (United States). DOE Contract AC05-84OR21400. From 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting; Boston, MA (United States); 30 Nov - 5 dec 1992. Order Number DE93015333. Source: OSTI; NTIS; GPO Dep.

Z-contrast imaging has been shown to be an effective method for obtaining a high-resolution image from a scanning transmission electron microscope (STEM). The incoherent nature of the high-angle scattering makes image interpretation straightforward and intuitive with the resolution limited only by the 2.2 Å electron probe. The optimum experimental conditions for Z-contrast imaging also coincide with those used for analytical microscopy, enabling microanalysis to be performed with the same spatial resolution as the image. The detection limits afforded by a parallel detection system for electron energy loss spectroscopy (EELS) allows column-by-column core-loss spectroscopy to be performed using the Z-contrast image to position the electron probe. Preliminary results from the study of $YBa_2Cu_3O_{7-\delta}$ illustrate the spatial resolution available with this technique and the potential applications for materials science.

26839 (CONF-930945–1) **Synergism in the extraction of Cu(II) by polydentate thia ligands combined with didodecylnaphthalene sulfonic acid.** Moyer, B.A.; Sachleben, R.A.; Case, G.N. Oak Ridge National Lab., TN (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International solvent extraction conference (ISEC '93); York (United Kingdom); 9-15 Sep 1993. Order Number DE93001207. Source: OSTI; NTIS; GPO Dep.

Tetradentate alkyl thia ethers strongly enhance the extraction of Cu(II) from aqueous sulfuric acid solution by the strong-acid cation exchanger didodecylnaphthalene sulfonic acid (HDDNS). Among the 12-, 14-, and 16-membered macrocyclic tetradentate thia ethers, the strongest enhancement was found with the 14-membered ring. Weak enhancement was observed for one

monodentate and two bidentate alkyl thia ethers. Two acyclic tetradentate thia ethers exhibited stronger enhancement than expected from the aqueous-phase macrocyclic effect. An equilibrium scheme is proposed to rationalize the results for the tetradentate ligands. 14 refs, 5 figs.

26840 (CONF-930945–2) **Extraction of a alkali metal cations using a lipophilic lariat ether having a c-pivot carboxylic acid sidearm.** Sachleben, R.A.; Moyer, B.A.; Case, F.I.; Driver, J.L. Oak Ridge National Lab., TN (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International solvent extraction conference (ISEC '93); York (United Kingdom); 9-15 Sep 1993. Order Number DE93002830. Source: OSTI; NTIS; GPO Dep.

The extraction of alkali metal cations by the lipophilic, ionizable lariat ether bis-tert-octylbenzo- 14-crown-4-acetic acid (BOB14C4AA) dissolved in either o-xylene or 1-octanol was studied by two-phase potentiometric titration and ion-exchange chromatography. BOB14C4AA extracts alkali metal cations from aqueous chloride solutions predominantly by ion exchange in the range p[H] > 7. From an aqueous mixture of alkali metal halides, BOB14C4AA extracts Li^+ cation preferentially up to complete loading. When the alkali metals are extracted individually, however, BOB14C4AA extracts Li^+ cation with highest efficiency only up to ca. 45% loading. Both selectivity and efficiency for extraction of Li^+ cation are enhanced with 1-octanol diluent as compared to o-xylene diluent.

26841 (DOE/MC/25135–3341) **Gas separations using ceramic membranes: Final report, September 1988–February 1993.** Lin, C.L.; Wu, J.C.S.; Gallaher, G.R.; Smith, G.W.; Flowers, D.L.; Gerdes, T.E.; Liu, P.K.T. Aluminum Co. of America, Alcoa Center, PA (United States). Alcoa Technical Center. Feb 1993. 203p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-88MC25135. Order Number DE93000278. Source: OSTI; NTIS; GPO Dep.

This study covers a comprehensive evaluation of existing ceramic membranes for high temperature gas separations. Methodology has been established for microporous characterization stability and gas separation efficiency. A mathematical model was developed to predict gas separations with existing membranes. Silica and zeolitic modifications of existing membranes were pursued to enhance its separation efficiency. Some of which demonstrate unique separations properties. Use of the dense-silica membranes for hydrogen enrichment was identified as a promising candidate for future development. In addition, the decomposition of trace ammonia contaminant via a catalytic membrane reactor appears feasible. A further economic analysis is required to assess its commercial viability.

26842 (INIS-mf–12758, pp. 271-274) **Uranium determination in zirconium.** Serdeiro, N.H. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Dept. de Quimica); Bianco de Salas, G.H.; Correia, R.J. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The method used for the spectrometric uranium determination with 2-(2-thiolase)-5-diethylaminophenol was modified for its application in the zirconium samples analysis with an uranium content of the 0.1% order. The samples, previously dissolved in nitric acid, were submitted to a separative stage of liquid-liquid extraction, with a trioctylphosphine (TOPO) oxide diluted in cyclohexane. A sodium fluoride aqueous solution was necessary to be aggregated in the spectrometric determination so as to complex the zirconium vestiges, which could be present, originated by the Zr/U high relation of the initial sample. Under the established working conditions, different spectrometric assays, dyes absorption spectra and its uranium complex, complex stability, PH influence determination of the dyes-uranium relation, calculation of the complex's apparent formation constant and its molar absorption, were performed. (Author).

26843 (INIS-mf–12758, pp. 236-244) **High purity zirconium obtainment through the iodine compounds transport method.** Bolcich, J.C. (Comision Nacional de Energia Atomica, San Carlos de Bariloche (Argentina). Centro Atomico Bariloche); Zuzek, E.; Dutrus, S.M.; Corso, H.L. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

This paper describes the experimental method and the equipment designed, constructed and actually applied for the high purity zirconium obtainment from a zirconium sponge of the nuclear type. The mechanism of purification is based on the impure metal attack with gaseous iodine (at 200 deg C) to obtain zirconium tetra iodine as main product which is then transformed into a pure zirconium base (at 1000-1300 deg C), precipitating the metallic zirconium and releasing the gaseous iodine. From the first experiences carried out, pure zirconium has been obtained from an initial filament of 0.5 mm of diameter as well as wires up to 2.5 mm of diameter. This work presents the results from the studies and analysis made to characterize the material obtained. Finally, the refining methods to which the zirconium produced may be submitted so as to optimize the final purity are discussed. (Author).

26844 (INIS-mf–12758, pp. 331-337) **Uranium removal from organic solutions of PUREX process.** Dell'Occhio, L.A. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Procesos Quimicos); Dupetit, G.A.; Pascale, A.A.; Vicens, H.E. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

During the uranium extraction process with tributyl phosphate (TBP) in nitric medium, a bi solvated, non hydrated complex is formed, of formula UO2(NO3)2TBP, which is soluble in the diluent, a paraffin hydrocarbon. As it is known that some uranium salts, for instance the nitrate, when dissolved in organic solvents, like isopropanol, can be discharged as complex molecules at the cathode of an electrodeposition cell, it was decided to apply this technique to uranium loaded TBP solutions. From preliminary experiments resulted a practical possibility for the analytical control through the alpha measurement of electro deposits. This technique could be applied as well to the treatment of depleted organic streams carrying undesirable alpha activity, because the so treated solutions become deprived of uranium. This work presents the curves obtained working at constant voltage with uranium-loaded TBP solutions, the determination of the optimal operation voltage in these conditions, the electrodeposition yield for electro polished copper and stainless steel cathodes and the tests of reproducibility of deposits. A summary of the results obtained operating the high voltage supply at constant power is also presented. (Author).

26845 (INIS-mf–12758, pp. 345-352) **Solvents extraction: results obtained from cycle operation. Pt. 2.** Bonini, A.A. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Procesos Quimicos); Falcon, M.F.; Gauna, A.C.; Maymo, J.A. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

In the first part of this work were described the results of the experimental program of one extraction cycle, scale 1:1, which represents that installed in the Laboratory of Radiochemical Processes

(LPR), using the system uranyl nitrate (natural uranium)-HNO3-H2O/TBP 30% in Molex. In the second part the following experiments were performed: (a) increase of uranium losses in the depleted solvent by introducing a high acidity current in the middle of the de-extraction contactor, in order to prevent the possible Pu(IV) polymerization; (b) increase of uranium losses in the depleted solvent when the de-extraction contactor is operated at room temperature instead of the design nominal value (60 deg C); (c) behaviour of cycle when it is operated with a higher solvent saturation than the design value; (d) determination of the limit decontamination factor of hardly extractable components, using Mg(NO3)2 as chemical tracer; (e) experimental evaluation of contamination of pulse generation systems and possible implications in the operation of LPR plant; (f) Transient related to the 'flushing' of uranium inventory that is contained in the cycle when the experimental program is finished. (Author).

26846 (JAERI-M–93-035) **Consecutive determination of pentavalent neptunium by spectrophotometric method.** Tanaka, Tadao (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Kamiyama, Hideo. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 27p. (In Japanese). Order Number DE93508314. Source: OSTI; NTIS; INIS.

Consecutive spectrophotometric determination of neptunium (V) was investigated on flow system, by using color reaction based on a complex formation with arsenazo III. Sample solutions containing $1 \times 10^{-6} \approx 1 \times 10^{-5}$ M neptunium (V) were used, and a 2×10^{-5} M arsenazo III (in HOAc-NaOAc buffer solution of pH 4.3) as a reagent solution. Two streams were propelled into flow-cell at the same flow rate of 0.5 ml/min by using a double plunger pump. Absorbance was measured at 650 nm. There was a linear relationship between $1 \times 10^{-6} \approx 1 \times 10^{-5}$ M neptunium (V), without influence of interfere ions dissolved out from various sedimental materials. The present method was successfully applied to the migration experiment of neptunium (V) in a sandy soil layer. (author).

26847 (JINR-D–14-91-395) **Recent development of radioanalytical method at IBR-2 pulsed fast reactor of the JINR.** Nazarov, V.M.; Pavlov, S.S.; Herrera, E. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1991. [12p.] (In Russian). Order Number DE93628920. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to International Conference 'Modern Trends in Activation Analysis', Septemder, 16-20, 1991, Vienna, Austria.

The experience of the use of radioanalytical methods, including NAA at IBR-2 pilsed fast reactor of the JINR, is discussed. Physical and technical parameters of the experimental installation designed for NAA and radiography are given. The detailed examples of the application of resonance neutrons to the control of the environment in the geology of oil, in multi-element analysis of food products and superpure materials as well as in nuclear physics are reviewed. The works on the application of the neutron isotopes sources for express determination of nitrogen content in original and synthetic materials are introduced. 7 refs.; 8 figs.; 3 tabs.

26848 (LA–12522-C) **Proceedings of the Alfred O. Nier symposium on inorganic mass spectrometry.** Rokop, D.J. (comp.) (ed.). Los Alamos National Lab., NM (United States). May 1993. 268p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9105216–: Symposium on inorganic mass spectrometry, Durango, CO (United States), 7-9 May 1991). Order Number DE93014376. Source: OSTI; NTIS; INIS; GPO Dep.

Over 100 inorganic mass spectroscopists, including representatives from 9 different countries, attended. This proceedings contains 12 papers, 11 abstracts, and 38 poster abstracts; an author index is included.

26849 (LBL-PUB–719) **Current titles.** Lawrence Berkeley Lab., CA (United States). Apr 1993. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015859. Source: OSTI; NTIS; INIS; GPO Dep.

116 abstracts are presented of work done with the electron microscope. NCEM is a DOE-designated national user facility and is available at no charge to qualified researchers (assess is controlled by a steering committee).

26850 (MHSMP–92-40) **Analysis of soil and water for TATB content.** Schaffer, C.L. Mason and Hanger-Silas Mason Co., Inc., Amarillo, TX (United States). Nov 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL65030. Order Number DE93009949. Source: OSTI; NTIS; GPO Dep.

A reverse-phase liquid chromatography (HPLC) method was developed for the analysis of TATB in soil samples. The soil samples were extracted with dimethylformamide (DMF). The extract was analyzed to determine the TATB content in the soil. The detection limit using this procedure was 2 parts/million (ppm) for TATB in the soil. An organic free sample of water was saturated with TATB. The water was filtered through a 0.2-μ filter, then injected into both a reverse-phase and normal-phase liquid chromatograph system. No peaks were detected. Therefore, the solubility of TATB in water is less than the detection limits of the chromatograph methods.

26851 (ORNL/FTR–4280) **Travel to Japan to participate in the international seminar on high-resolution STEM: Foreign trip report, June 9–16, 1992.** Pennycook, S.J. Oak Ridge National Lab., TN (United States). 1 Jul 1992. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011067. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler's visit to Sumitomo Metal Industries was shortly after the return of one of their research staff members, E. Takasuka, who had spent one year on a research assignment at ORNL in the traveler's group. Although a large steel-making company, Sumitomo Metals introduced a policy of diversification in 1988 and now spends 50% of its impressive research budget on advanced materials research of all kinds. The traveler visited the semiconductor research department. Most impressive was their level of investment in research equipment. Sumitomo Metals is not a leading supplier of semiconductor process equipment, but their Process Equipment Research Laboratory contained five electron cyclotron resonance (ECR) plasma systems for research on deposition and etching. A $\pm$4% uniformity in deposition is achieved with a single plasma source. Also, purely for research purposes are several molecular beam epitaxy deposition systems for growing GaAs on Si. There appear to be more systems than research staff, and all are located in a class 100 dean room. The Semiconductor Device Research Laboratory comprises a complete 0.8-μm large-scale integration process line, again entirely for research, into the development of specialized chips for graphics applications (a small "niche" market). This line also includes two ECR systems. Research spans from circuit design through metallization to long-term device characteristics monitoring. Almost every conceivable characterization tool is available-infrared tomographic imaging, Fourier transform infrared spectroscopy, a device that apparently can measure planarity across a wafer to su-nm accuracy, and all kinds of testing equipment for electrical characterization.

26852 (PNL-SA–21721) **A smart sensor system for trace organic vapor detection using a temperature-controlled array of surface acoustic wave vapor sensors, automated preconcentrator tubes, and pattern recognition.** Grate, J.W. (Pacific Northwest Lab., Richland, WA (United States)); Rose-Pehrsson, S.L.; Klusty, M.; Wohltjen, H. Pacific Northwest Lab., Richland, WA (United States). May 1993. 13p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930571–18: 183. Electrochemical Society meeting, Honolulu, HI (United States), 16-21 May 1993). Order Number DE93015695. Source: OSTI; NTIS; GPO Dep.

A smart sensor system for the detection, of toxic organophosphorus and toxic organosulfur vapors at trace concentrations has been designed, fabricated, and tested against a wide variety of vapor challenges. The key features of the system are: An array of four surface acoustic wave (SAW) vapor sensors, temperature control of the vapor sensors, the use of pattern recognition to analyze the sensor data, and an automated sampling system including thermally-desorbed preconcentrator tubes (PCTs).

26853 (PNL-SA–22007) **Plutonium bioassay by inductively coupled plasma mass spectrometry ICP/MS.** Wyse, E.J.; Fisher, D.R. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9304128–12:

Department of Energy (DOE) radiation protection conference, Las Vegas, NV (United States), 13-15 Apr 1993). Order Number DE93015687. Source: OSTI; NTIS; INIS; GPO Dep.

The determination of plutonium in urine poses several analytical challenges, e.g., detectability, matrix, etc. We have investigated the feasibility of analyzing plutonium in processed urine by inductively coupled plasma mass spectrometry (ICP/MS). The urine samples are first spiked with ^{244}Pu as a tracer and internal standard, then processed by co-precipitation and column chromatography using TRU-Spec™, an extraction resin. By enhancing ICP/MS detection capabilities via improved sample introduction and data acquisition efficiencies, an instrumental detection limit of 5 to 50 fg (0.3 to 3 fCi for ^{239}pu) is typically obtained, depending on the desired degree of quantitation. A brief summary of the analytical method as well as the basis for measuring radionuclides by ICP/MS are submitted; the separation procedure, methods of sample introduction, and data acquisition techniques are then highlighted.

26854 (UCRL-ID–110984) **Raman scattering method for measuring HNO_3 concentration.** Wooldridge, J.; Johnson, G.W.; Cassidy, K.; Summers, L.; Lewis, P.; Gordon, S. Lawrence Livermore National Lab., CA (United States). Jun 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014833. Source: OSTI; NTIS; GPO Dep.

The Advanced Processing Technology (APT) group has been experimenting with several processes which are dependent upon nitric acid concentrations, thus a need exists to diagnose these quantities. This report describes a series of experiments which used the Raman scattering method for measuring nitric acid concentrations. These tests were performed at LLNL in Bldg. 241 during the months of September 1991 to December 1991. The basic instrument used for this series was a Spex Raman Spectrometer, Model 1488, with a DM1B computer system.

26855 (UCRL-JC–104107) **X-ray optics for scanning fluorescence microscopy and other applications.** Ryon, R.W. (Lawrence Livermore National Lab., CA (United States)); Warburton, W.K. Lawrence Livermore National Lab., CA (United States). May 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-910862–9: Pacific-international congress on x-ray analytical methods, Honolulu, HI (United States), 12-16 Aug 1991). Order Number DE93015116. Source: OSTI; NTIS; INIS; GPO Dep.

Scanning x-ray fluorescence microscopy is analogous to scanning electron microscopy. Maps of chemical element distribution are produced by scanning with a very small x-ray beam. Goal is to perform such scanning microscopy with resolution in the range of <1 to 10 μm, using standard laboratory x-ray tubes. We are investigating mirror optics in the Kirkpatrick-Baez (K-B) configuration. K-B optics uses two curved mirrors mounted orthogonally along the optical axis. The first mirror provides vertical focus, the second mirror provides horizontal focus. We have used two types of mirrors: synthetic multilayers and crystals. Multilayer mirrors are used with lower energy radiation such as Cu Kα. At higher energies such as Ag Kα, silicon wafers are used in order to increase the incidence angles and thereby the photon collection efficiency. In order to increase the surface area of multilayers which reflects x-rays at the Bragg angle, we have designed mirrors with the spacing between layers graded along the optic axis in order to compensate for the changing angle of incidence. Likewise, to achieve a large reflecting surface with silicon, the wafers are placed on a specially designed lever arm which is bent into a log spiral by applying force at one end. In this way, the same diffracting angle is maintained over the entire surface of the wafer, providing a large solid angle for photon collection.

26856 (BNL–48966) **The application of infrared synchrotron radiation to the study of interfacial vibrational modes.** Hirschmugl, C.J.; Williams, G.P. Brookhaven National Lab., Upton, NY (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-921277–1: NATO advanced research workshop, Maderia (Portugal), Dec 1992). Order Number DE93015393. Source: OSTI; NTIS; INIS; GPO Dep.

Synchrotron radiation provides an extremely bright broad-band source in the infrared which is ideally suited to the study of surface and interface vibrational modes in the range 50–3,000 cm^{-1}. Thus it covers the important range of molecule-substrate interactions, as well as overlapping with the more easily accessible near-ir region where molecular internal modes are found. Compared to standard broadband infrared sources such as globars, not only is it 1,000 times brighter, but its emittance matches the phase-space of the electrochemical cell leading to full utilization of this brightness advantage. In addition, the source is more stable even than water-cooled globars in vacuum for both short-term and long-term fluctuations. The authors summarize the properties of synchrotron radiation in the infrared, in particular pointing out the distinct differences between this and the x-ray region. They use experimental data in discussing important issues of signal to noise and address the unique problems and advantages of the synchrotron source. Thus they emphasize the important considerations necessary for developing new facilities. This analysis then leads to a discussion of phase-space matching to electrochemical cells, and to other surfaces in vacuum. Finally they show several examples of the application of infrared synchrotron radiation to surface vibrational spectroscopy. The examples are for metal crystal surfaces in ultra-high vacuum and include CO/Cu(100) and (111) and CO/K/Cu(100). The experiments show how the stability of the synchrotron source allows subtle changes in the background to be observed in addition to the discrete vibrational modes. These changes are due to electronic states induced by the adsorbate. In some cases the authors have seen interferences between these and the discrete vibrational modes, leading to a breakdown of the dipole selection rules, and the observation of additional modes.

26857 (CONF-930364–4) **Measurement of water diffusivity in aqueous lithium bromide solution.** Potnis, S.V.; Lenz, T.G.; Dunlop, E.H. Colorado State Univ., Fort Collins, CO (United States). Dept. of Agricultural and Chemical Engineering. [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86SF16306. From Spring national meeting of the American Institute of Chemical Engineers; Houston, TX (United States); 28 Mar - 1 apr 1993. Order Number DE93014705. Source: OSTI; NTIS; GPO Dep.

The bulb apparatus developed was found to produce reliable data for measuring diffusivity for short duration. Diffusivity of water in aq. LiBr solution was found to increase from 13.2×10^{-10} to $16.7\times10^{-10}m^2/s$ for concentration change from 0.5 to 4M and then decrease to a steady value of $\sim6.5\times10^{-10}m^2/s$ from 8 to 11 M.

26858 (DOE/ER/13183–8) **[Experimental and kinetic modeling of acid/base and redox reactions over oxide catalysts]: Technical progress report.** Wisconsin Univ., Madison, WI (United States). [1993]. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84ER13183. Order Number DE93016203. Source: OSTI; NTIS; GPO Dep.

The research has involved the characterization of catalyst acidity, ^{2}D NMR studies of Bronsted acid sites, and kinetic, calorimetric, and spectroscopic studies of methylamine synthesis and related reactions over acid catalysts. Approach of this work was to explore quantitative correlations between factors that control the generation, type, strength, and catalytic properties of acid sites on zeolite catalysts. Microcalorimetry, thermogravimetric analysis, IR spectroscopy, and NMR spectroscopy have provided information about the nature and strength of acid sites in zeolites. This was vital in understanding the catalytic cycles involved in methylamine synthesis and related reactions over zeolite catalysts.

26859 (DOE/ER/13933–3) **Quantum state resolved desorption of CO from solid surfaces: Final technical report.** Janda, K.C. Pittsburgh Univ., PA (United States). Dept. of Chemistry. [1992]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER13933. Order Number DE93016876. Source: OSTI; NTIS; GPO Dep.

The work consisted of two major efforts. First, we studied the recombinative desorption of hydrogen atoms from a Si(100) surface. The desorption kinetics turned out to scale with the first power of the hydrogen atom coverage on the surface instead of the second power. The interpretation of these results is rather controversial. The second series of studies focus on mixing of isotopic composition between CO molecules on a Ni(111) surface. The isotopic mixing reaction was found to proceed at modest surface temperatures, but not to go to completion even at high surface temperatures.

26860 (DOE/ER/14193–5) **Thermochemistry of transition metal clusters: Technical progress report.** Armentrout, P.B. Utah Univ., Salt Lake City, UT (United States). Dept. of Chemistry. [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER14193. Order Number DE93016201. Source: OSTI; NTIS; GPO Dep.

Objective is to obtain therodynamic properties of transition metal ion clusters, their binding energies to ligands, and their reactions, using a mass spectrometer and a photodissociation spectrometer. In addition to metal cluster ions, atomic metal ions with up to 4 H_2O molecules or He or Ar atoms as ligands have been generated.

26861 (DOE/ER/14273–1) **[Oxidation catalysis with tris(pyrazolyl)borate metal complexes]: Progress report.** Theopold, K.H. Delaware Univ., Newark, DE (United States). Dept. of Chemistry and Biochemistry. [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER14273. Order Number DE93016214. Source: OSTI; NTIS; GPO Dep.

Progress was made in elucidating the mechanism of the O_2 activation by tris(pyrazolyl)borate cobalt complexes. A series of Tp^{i}Co-complexes (Tp^{i}=hydridotris(3-i-propyl-5- methylpyrazolyl)borate) was prepared.

26862 (DOE/PC/90035–T1) **Synthesis of 6-Methyl-9-propyldibenzothiophene-4-ol: Quarterly technical progress report No. 1, July 25, 1990– October 25, 1990.** Eisenbraun, E.J. Oklahoma State Univ., Stillwater, OK (United States). Dept. of Chemistry. 20 Nov 1990. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90035. Order Number DE93015780. Source: OSTI; NTIS; GPO Dep.

Conversion of 4'-methylpropiophenone to 1-methyl-4-n-propylbenzene was accomplished in high yields. Bromination of the latter resulted in isomers of methyl-n-propyl-1-bromobenzene. Reaction of the isomers with sodium butoxide and 2-methoxybenzenethiol in presence of $Pd[P(C_6H_5)_3]_4$ in 1-butanol was studied. The methylpropylbenzene was also iodinated. A decision to use iodination vs bromination will be made when more data are accumulated. 6 refs, figs.

26863 (DOE/PC/90035–T3) **Synthesis of 6-Methyl-9-n-propyldibenzothiophene-4-ol: Quarterly technical progress report No. 3, February 25, 1991–April 25, 1991.** Eisenbraun, E.J. Oklahoma State Univ., Stillwater, OK (United States). Dept. of Chemistry. 27 Apr 1991. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90035. Order Number DE93015778. Source: OSTI; NTIS; GPO Dep.

The material covered here can be divided into 3 parts: large-scale synthesis of 200+ grams of distilled 1,4-diethyl-2-[(2'-methoxyphenyl)thio]benzene, synthesis of sulfones both as starting materials for chemical cyclization reactions and as solid derivatives for identification purposes, and continued investigation of the cyclization to dibenzothiophenes both by chemical and photochemical means. 5 refs, figs.

26864 (DOE/PC/90035–T4) **Synthesis of 6-Methyl-9-n-propyldibenzothiophene-4-ol: Quarterly technical progress report No. 4, April 25–July 25, 1991.** Eisenbraun, E.J. Oklahoma State Univ., Stillwater, OK (United States). Dept. of Chemistry. 25 Jul 1991. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90035. Order Number DE93015777. Source: OSTI; NTIS; GPO Dep.

The material covered in this report is divided into two parts: further cyclization experiments on 1,4-diethyl-2-[(2'-methoxyphenyl)thio]benzene and its sulfone both by chemical and photochemical means, and progress toward synthesis of modified target molecule, 9-isopropyl-4-methoxy-6-methyldibenzo-thiophene. 8 refs, figs.

26865 (DOE/PC/90035–T5) **Synthesis of 6-Methyl-9-n-propyldibenzothiophene-4-ol: Quarterly technical progress report No. 5, July 28–October 28, 1991.** Oklahoma State Univ., Stillwater, OK (United States). 28 Oct 1991. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90035. Order Number DE93015776. Source: OSTI; NTIS; GPO Dep.

The material presented here has been described to some extent in Status Reports 12, 13, and 14 and covers the progress toward the synthesis of the modified target molecules 9-isopropyl-4-methoxy-6-methyldibenzothiophene (13) and 9-isopropyl-6-methyldibenzothiophene-4-ol (14). It is divided into three parts: (a) Dehydrogenation experiments On tetrahydrodibenzothiophene 12. (b) methoxyl methyl cleavage of 13 to 14 using boron tribromide. (c) isolation and purification of methoxydibenzothiophene 13.

26866 (INIS-mf–13538) **The extraction of titanium, chromium and cadmium from phosphoric acid solutions by para (1,1,3,3 tetramethyl butyl) phenyl phosphoric acid in kerosene diluent.** Mellah, Abdelhamid (Centre de Developpement des Materiaux, Algiers (Algeria)); Bauer, Denise. Secretariat d'Etat a la Recherche, Algiers (Algeria). Mar 1993. [9p.] Order Number DE93628963. Source: OSTI; NTIS (US Sales Only); INIS.

The distribution of titanium, chromium and cadmium between phosphoric acid solutions and solutions of para (1,1,3,3, tetramethyl butyl) phenyl phosphoric acid in kerosene diluent has been investigated under different conditions. The aqueous and organic phases were analyzed by inductively coupled emission atomic spectrophotometry. From the results it is found that the extraction efficiency of para (1,1,3,3 tetramethyl butyl) phenyl phosphoric acid for metals is Ti > Cr > Cd for [H3PO4] > 7 M and Cr > Cd > Ti mor [H3PO4]m< 5 M.

26867 (LA-UR–93-1527) **Destruction of waste energetic materials using base hydrolysis.** Benziger, T.M.; Buntain, G.A.; Sanchez, J.A.; Spontarelli, T. Los Alamos National Lab., NM (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930572–3: 12. annual international symposium on thermal treatment technologies - incineration conference, Knoxville, TN (United States), 3-7 May 1993). Order Number DE93012738. Source: OSTI; NTIS; INIS; GPO Dep.

In dismantling weapons from stockpile reduction, environmentally acceptable degradation of the associated high explosive (HE) waste to non-energetic forms is a critical objective. Base hydrolysis appears to be a simple, inexpensive method for converting propellants, explosives, and pyrotechnics (PEPS) into non-energetic materials that can be released directly or, if necessary, treated further. We have demonstrated that many PEPs can be hydrolyzed with aqueous sodium hydroxide or ammonia at temperatures ranging from 60 to 150°C. Hydrolysis experiments have been performed on pure compounds as well as DOE and DoD formulations, such as plastic-bonded explosive (PBX) 9404, tritonal, and rocket motor propellant. Small particle size of the energetic material is desirable, but not necessary. We have decomposed molding powder, pressed charges up to two pounds in weight, and partially exposed, metal-encased pieces. The products formed are dependent on the starting material composition, but usually consist of organic and inorganic salts, e.g., sodium formate, acetate, nitrite and nitrate. The major gaseous product from the base hydrolysis of PEPs is nitrous oxide. The time required for complete destruction varies with the material being hydrolyzed, and is dependent on solubility and mass transfer. Hydrolysis rates can be increased by particle size reduction, efficient stirring, and addition of organic solvent to the alkaline solution. Rate enhancement by ultrasonic agitation is a possibility that we have just begun to study.

26868 (LBL–32461) **Conversion of ethane and of propane to higher olefin hydrocarbons: Quarterly report, April 1–June 30, 1992.** Heinemann, H.; Somorjai, G.A. Lawrence Berkeley Lab.,

CA (United States). Jun 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015267. Source: OSTI; NTIS; GPO Dep.

Binary catalysts for oxydehydrogenation of ethane were prepared and tested: $Mo_{19}NbO_x$, Mo_4VO_x, V_5NbO_x. The combination of Mo and V is more active, selective than V-Nb or Mo and Nb. Nb in catalysts, particularly ternary, inhibits CO_2 formation. Propane oxydehydrogenation occurs at lower temperature than ethane conversion over both binary and ternary catalysts; however selectivity to propylene is lower than for ethylene from ethane. Propylene is completely converted to carbon oxides when charged to the catalyst in absence of propane. Attempts failed to obtain higher hydrocarbons by oligemerizing propylene over acidic catalysts as it is formed.

26869 (LBL–32845) **Pore-size-distribution of cationic polyacrylamide hydrogels: Progress report.** Kremer, M.; Prausnitz, J.M. Lawrence Berkeley Lab., CA (United States). Jun 1992. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015218. Source: OSTI; NTIS; GPO Dep.

The pore size distribution of a AAm/MAPTAC (acrylamide copolymerized with (3-methacrylamidopropyl)trimethylammonium chloride) hydrogel was investigated using Kuga's mixed-solute-exclusion method, taking into account the wall effect. A Brownian-motion model is also used. Results show the feasibility of determining pore-size distribution of porous materials using the mixed-solute-exclusion method in conjunction with solution of the Fredholm equation; good agreement was obtained with experiment, even for bimodal pore structures. However, different pore size distributions were calculated for the two different probe-solutes (Dextran and poly(ethylene glycol/oxide)). Future work is outlined. 32 figs, 25 refs.

26870 (LBL–32956) **Swelling equilibria for temperature-sensitive ampholytic hydrogels.** Baker, J.P.; Stephens, D.R.; Blanch, H.W.; Prausnitz, J.M. Lawrence Berkeley Lab., CA (United States). Sep 1992. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015264. Source: OSTI; NTIS; GPO Dep.

Temperature-sensitive N-isopropylacrylamide (NIPA)-based ampho-lytic hydrogels were synthesized by copolymerizing NIPA with the cationic monomer methacrylamidopropyl trimethylammonium chloride (MAPTAC) and the anionic monomer sodium styrene sulfonate (SSS). The total nominal charge density of the hydrogels was held constant at 8 mol % (dry basis), while the molar ratio of anionic to cationic moieties within the hydrogels was varied. Swelling equilibria were measured in water at 6C, and in aqueous sodium chloride solutions ranging in concentration from $10^{-5}$to 5 M and temperature ranging from 6 to 56C. Consistent with expectations, the swelling behavior of the hydrogels was found to be controlled by temperature at low salt concentrations; as the sodium chloride concentration increased, temperature control of hydrogel swelling decreased. Slight antipolyelectrolyte behavior was observed for the hydrogel prepared with equal molar amounts of MAPTAC and SSS.

26871 (LBL–33919-ABS) **Molecular beam studies of reaction dynamics.** Lee, Yuan T. Lawrence Berkeley Lab., CA (United States). Mar 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9306172–1: 15. combustion research contractors' meeting, Lake Harmony, PA (United States), 2-4 Jun 1993). Order Number DE93015035. Source: OSTI; NTIS: GPO Dep.

Thrust was to elucidate simple elementary reactions and to unravel mechanism of complex/photochemical reactions. Molecular beams are used to study reactions between molecules or to monitor photodissociation events in a collision-free environment. Recent activities centered on reactions involving oxygen atoms with unsaturated hydrocarbons, endothermic substitution reactions, dependence of reactivity of excited atoms on alignment of excited orbitals, photochemical reactions of polyatomic, energy transfer, free radicals in combustion processes, infrared absorption spectra of carbonium ions and hydrated hydronium ions, and bond-selective photodissociation.

26872 (NUTEK-FBT–93-9) **Studies of intermediates, in catalytic reactions, catalysts and catalytic combustion using laser and mass spectrometry.** Rosen, A. (Chalmers Univ. of Technology and Gothenburg Univ. (Sweden). Dept. of Physics). Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). 1993. 20p. Project NUTEK-276-330. Order Number DE93500737. Source: OSTI; NTIS.

We have in this project focused our research on a study of the most simple model reaction, that includes OH-radicals, which is the oxidation of hydrogen to water on a metal catalyst. The OH radical is formed at the surface of the catalyst when molecular hydrogen and oxygen first dissociate at the surface and then recombine to OH, which are consumed in the water formation. The OH radical is very short-lived and the concentration is therefore low. If the catalyst is kept at a high temperature (> 1000 K) there is a small possibility that OH radicals desorb from the catalyst before being consumed in the water production. The OH radical has been detected and characterized with respect to its yield, activation energy for desorption and rotational energy using the laser-induced fluorescence technique (LIF). The project also includes space resolved studies of the OH radical outside the catalytic foil using imaging of the fluorescence light from the OH radicals with a diode array and CCD camera. In this study the desorption angle, rotational cooling of the reactants, possible gas phase reactions and different effects of the flow of the OH radicals are investigated. Further, impurities of the catalysts have been analyzed using the Laser Ionization Mass Spectrometry technique.

26873 (PNL–SA-22038) **The role of interfacial chemistry in surface nucleation and growth of calcium oxalate.** Song, L.; Campbell, A.A.; Bunker, B.C. Pacific Northwest Lab., Richland, WA (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830 ;FG06-89ER75522. (CONF-930405–20: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93015689. Source: OSTI; NTIS; GPO Dep.

The surface adsorption of Ca^{2+} and oxalate anions (Ox^{2-}) on SiO_2, TiO_2 and Al_2O_3 oxide colloids were by electrosonic amplitude measurements. Kinetics studies of CaO_x formation on the model oxide surfaces were carried out using constant composition method. Results suggested Ca^{2+} and Ox^{2-} adsorptiopn was promoted on the oxide surfaces with opposite charges, and the specific adsorption of the divalent ions also resulted in surface charge reversal. For heterogeous nucleation of CaO_x on the three model oxide surfaces, induction times ranged from 270 to 360 minutes compared with 1200 minutes estimated for homogeneous nucleation and 700 minutes for spontaneous or nucleation at pH 6.5 and S = 3.3. Lower nucleation barriers, 27 mJ/m^2 for SiO_2, 26 mJ/m^2 for TiO_2, were observed by studying the dependence of nucleation induction times as the function of solution supersaturation.

26874 (UCRL-JC–112346) **Electronic structure and enthalpy of hydrogen and helium mixtures.** Ross, M.; Klepeis, J.E.; Schafer, K.J.; Barbee, T.W. III. Lawrence Livermore National Lab., CA (United States). Nov 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9208135–7: International conference on the physics of strongly coupled plasmas, Rochester, NY (United States), 17-21 Aug 1992). Order Number DE93014128. Source: OSTI; NTIS; INIS; GPO Dep.

The first local density approximation (LDA) calculations of the electronic structure, equation of state and enthalpy of mixing were carried out for a number of different compositions of hydrogen and helium in bcc and fcc lattices. These are fully quantum mechanical, self-consistent calculations utilizing state-of-the-art methods of electron band theory, which make no assumptions regarding pressure ionization. The major approximation in the LDA method is that the exchange and correlation energy is given by a free electron functional in terms of the local electron density. The majority of previous mixture calculations start with the assumption that both hydrogen and helium are pressure-ionized so that the electronic structure is approximately that of free or weakly screened electrons in the presence of positive ions. Stevenson used a hard-sphere mixture model for the ions with an ion-ion pseudopotential to

account for electron screening and predicted that a mixture containing 7% helium by number, the composition believed to be present in Jupiter and Saturn, would phase separate at a temperature of about 7000 K at 8 Mbar. Subsequent calculations carried out for the fully ionized mixture and for a mixture of screened ions (linear response theory) have all arrived at predictions similar to those of Stevenson. MacFarlane and Hubbard performed ThomasFermi-Dirac calculations for mixing enthalpies of hydrogen and helium in bcc and fcc lattices and predicted that phase separation would not occur at any temperature.

26875 (ANL/CHM/CP–79508) **EXAFS studies on the structure of photoexcited cyclopentadienylnickelnitrosyl(C_5H_5NiNO).** Chen, L.X. (Argonne National Lab., IL (United States)); Bowman, M.K.; Montano, A.; Norris, J.R. Argonne National Lab., IL (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930405–3: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93012880. Source: OSTI; NTIS; GPO Dep.

The structures of C_5H_5NiNO in a reversible photochemical reaction were studied via EXAFS, FTIR, and optical absorption spectroscopies. A photoexcited intermediate with distinctively different EXAFS, IR, and optical absorption spectra from those of the ground state molecules was generated upon irradiation using 365 mn light at 20K in a 3-methylpentane solution. The reverse reaction was induced by irradiation with 310 mn light. The EXAFS data analysis has shown a 0.12 Å elongation of the Ni-N bond and the bending, of Ni-N-0 in the photoexcited intermediate. Several ZINDO calculations were conducted based on the structures obtained from the EXAFS spectroscopy. These calculations reproduced the changes in the optical spectra and the intramolecular electron transfer in C_5H_5NiNO.

26876 (DOE/ER/14205–2) **Photochemical dynamics of surface oriented molecules: Progress report, August 1, 1992–July 31, 1993.** Ho, W. Cornell Univ., Ithaca, NY (United States). Dept. of Physics. [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER14205. Order Number DE93016289. Source: OSTI; NTIS; GPO Dep.

Photodesorption and photoreaction was investigated using a mass spectrometer, on O_2 alone and coadsorbed with CO on Pt(111) at 80 K. Desorption of O_2 continues for 1 ps, indicating multiple excitation of adsorbed O_2 by photogenerated hot electrons. The branching ratio for O_2 desorption to CO_2 product formation increases as the O_2 is photoexcited by femtosecond light pulses, in contrast to the larger CO_2 photoyield for nanosecond laser excitation.

26877 (LBL–34131) **Application of synchrotron radiation in chemical dynamics.** Heimann, P.; Koike, M.; Kung, A.H.; Ng, C.Y.; White, M.G.; Wodtke, A. Lawrence Berkeley Lab., CA (United States). May 1993. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9302107–Summ.: Application of synchrotron radiation and chemical dynamics workshop report, Oakland, CA (United States), 3-5 Feb 1993). Order Number DE93015040. Source: OSTI; NTIS; INIS; GPO Dep.

In October 1992, funding was approved to begin construction of a beamline and two end stations to support chemical dynamics experiments at LBL's Advanced Light Source (ALS). This workshop was organized to develop specifications and plans and to select a working team to design and supervise the construction project. Target date for starting the experiments is January 1995. Conclusions of the workshop and representative experiments proposed in earlier workshops to form the basis for beamline plans and end-station designs are summarized in this report. 6 figs.

26880 (LA–12554) **Reduction of Pu(VI) with hydrogen peroxide: Effects of plutonium, perioxide, and iron concentrations and of reaction time.** Marsh, S.F.; Martinez, E.A.; Day, R.S.; Nixon, A.E. Los Alamos National Lab., NM (United States). Jun 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93013598. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The rate and extent of PU(VI) reduction in 7 M nitric acid were measured as a function of the concentration of plutonium, the relative concentrations of hydrogen peroxide and iron, and the reaction time. Plutonium concentrations of 2, 5, 15, 30, and 50 g/L were evaluated. At each plutonium concentration, the tested mole ratios of H_2O_2/Pu were 0, 2, 4, and 8, and the mole ratios of Fe/Pu were 0, 0.1, 0.3, and 0.5. Plutonium oxidation states were determined by absorption spectrophotometry before treatment and after reaction periods of 30 min, 2 h, and 6 h. High concentrations of plutonium promote the reduction of PU(VI) by peroxide. Iron hinders the reduction of PU(VI) at low concentrations of plutonium but promotes the reaction at higher plutonium concentrations. Although a significant portion of PU(VI) is often reduced completely to PU(III) by peroxide in the absence of iron, PU(III) is reoxidized to PU(IV) in nitric acid when iron is present.

26881 Enantioselective synthesis of L-(-)-4-boronophenylalanine (L-BPA). Samsel, E.G. To Dept. of Energy. 1991. Filed date 4 Jun 1991. USA patent application 7-710,208. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93015704. Source: OSTI; NTIS; GPO Dep.

4-Boronophenylalanine (BPA) is being investigated for boron neutron capture therapy of metastatic melanomas and other tumors. It is believed that the pure enantiomer L-BPA is more biologically active than the D,L racemate. This patent discloses a

method of making substantially pure L-BPA. The method comprises the steps of reacting 4-bromobenzaldehyde with ethylene glycol, reacting the resulting acetal with Mg to produce a Grignard reagent and thereafter reacting with tributyl borate and then converting to an acid environment to form 4-boronobenzaldehyde, which is then reacted with diethanol amine, condensing the resulting ester with 2-phenyl-2-oxazolin-5-one to form an azlactone, reacting the azlactone with an alkali metal hydroxide, asymmetrically hydrogengating the product in the presence of Rh chelate to form L-(+)-N-benzoyl-4-boronophenylalanine, and thereafter acidifying this in an organic medium to produce L-BPA.

26882 (UCRL-ID–112994) **Measurement of plutonium and americium volatilities under thermal process conditions: Final report.** Krikorian, O.H.; Condit, R.H.; Fontes, A.S. Jr.; Fleming, D.L.; Magana, J.W.; Morris, W.F.; Adamson, M.G. Lawrence Livermore National Lab., CA (United States). 28 Apr 1993. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014365. Source: OSTI; NTIS; GPO Dep.

We have used the transpiration method to measure volatilities of Pu and Am from PuO_2(s) and PuO_2/2% AmO_2(s) in the presence of steam and oxygen at temperatures of 1230–1430 K. We find the volatile species to be $PuO_2(OH)_2$(g) and $AmO_2(OH)_2$(g) at vapor pressures on the order of 10^{-10} atm and 10^{-12} atm respectively under measurement conditions. For the Pu volatilization reaction, PuO_2(s) + 1/2 0_2(9) + H_20(g) = $PuO_2(OH)_2$(g), we obtain a free energy of reaction of ΔG^O_T = 231.3–0.0109 T in kj/mol, and for the Am volatilization reaction, AmO_2(s.s. in PuO_2) + 1/2 0_2(9) + H_20(g) = $AmO_2(OH)_2$(g), we obtain AG^O_T = 223.9–0.0109 T in kj/mol. We apply these results to the Rocky Flats Plant Fluidized Bed Incinerator to assess the amount of volatile Pu and Am produced in the secondary combustor chamber. Taking operating conditions of 550C combustor temperature, 40 kmols/h of total gas flow at 1 atm pressure, 0.1 atm 0_2(9), 0.05 atm H_20(g), PuO_2 (s) containing 200 ppm AmO_2 in the bed, and 6000 h of operating time per year, gives volatilization rates of 7 x 10^{-6}g Pu and 4 x 10^{-9}g Am/y.

26883 (WSRC-TR–92-438) **Materials compatibility of hydride storage materials with austenitic stainless steels.** Clark, E.A. Westinghouse Savannah River Co., Aiken, SC (United States). 21 Sep 1992. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93013688. Source: OSTI; NTIS; GPO Dep.

This task evaluated the materials compatibility of $LaNi_{5-x}Al_x$ (x= 0.3, 0.75) hydrides and palladium coated kieselguhr with austenitic stainless steel in hydrogen and tritium process environments. Based on observations of retired prototype hydride storage beds and materials exposure testing samples designed for this study, no materials compatibility problem was indicated. Scanning electron microscopy observations of features on stainless steel surfaces after exposure to hydrides are also commonly found on as-received materials before hydriding. These features are caused by either normal heat treating and acid cleaning of stainless steel or reflect the final machining operation.

The BES research efforts cover chemical reaction theory, experimental dynamics and spectroscopy, thermodynamics of combustion intermediates, chemical kinetics, reaction mechanisms, combustion diagnostics, and fluid dynamics and chemically reacting flows. 98 papers and abstracts are included. Separate abstracts were prepared for the papers.

26885 (CONF-930392–2) **A proposed mechanism for the pyrolysis of diborane.** Colket, M.B.; Montgomery, J.A. Jr. United Technologies Research Center, East Hartford, CT (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER13560. Grant BES-ER-13560. From 1993 joint Central States and Eastern sections of the Combustion Institute; New Orleans, LA (United States); 15-17 Mar 1993. Order Number DE93014275. Source: OSTI; NTIS; GPO Dep.

We examined the technique used by Fridman and Fehlner. The products B_3H_7 and B_3H_9 were trace species observed over the mass range 34-38 amu. Additional reactions were included to form the tetraborane and pentaborane; the five-step reaction is tabulated along with rate and reverse rate constants. Predictions are compared to decomposition data of Clarke and Pease. 16 refs, 2 tabs, 2 figs.

26886 (DOE/ER/13934–T1) **Studies of combustion reactions at the state-resolved differential cross section level: Progress report, March 1, 1992–February 27, 1993.** Houston, P.L. Cornell Univ., Ithaca, NY (United States). Dept. of Chemistry. 12 Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER13934. Order Number DE93017605. Source: OSTI; NTIS; GPO Dep.

This program explores a new technique for obtaining differential cross sections with product state resolution. The three-dimensional velocity distribution of state-selected reaction products is determined by ionizing the appropriate product, waiting for a delay while it recoils along the trajectory imparted by the reaction, and finally projecting the spatial distribution of ions onto a two dimensional screen using a pulsed electric field. Knowing the arrival time allows the ion position to be converted to a velocity, and the density of velocity projections can be inverted mathematically to provide three-dimensional velocity distribution for the selected product. Apparatus has been constructed and tested using photodissociations. The proposed research will both develop the new technique and employ it to investigate methyl radical, formyl radical, and hydrogen atom reactions which are important in combustion processes. We intend specifically to characterize the reactions of CH_3 with H_2 and H_2CO; of HCO with 0_2; and of H with CH_4, CO_2 and O_2.

26887 (DOE/ER/14128–T1) **Reaction and diffusion in turbulent combustion: Progress report.** Pope, S.B. Cornell Univ., Ithaca, NY (United States). 18 Jun 1993. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER14128. Order Number DE93017085. Source: OSTI; NTIS; GPO Dep.

A class of turbulent combustion models known as PDF methods has been developed. These methods have the important virtue that both convection and reaction can be treated without turbulence-modelling assumptions. However, a mixing model is required to account for the effects of molecular diffusion. Currently, the available mixing models are known to have some significant defects. Motivation of the project is to seek a better understanding of molecular diffusion in turbulent reactive flows; and thereby to provide guidance to the development of improved mixing models. Principal approach taken in the research is to use Direct Numerical Simulations (DNS) to study the coupled processes of reaction and molecular mixing in turbulent combustion. Because of inevitable computational limitations, it is impossible to simulate turbulent combustion in the parameter range of practical interest. Instead, our approach is to study very simple turbulent reactive flows that contain qualitatively some of the same phenomena as real flames. Statistical models will be developed that are applicable to practical combustion devices. The DNS studies related to non-premixed combustion are described. An additional topic studied, was mixing from the viewpoint of relative molecular motion.

26888 (DOE/ER/14306–1) **Infrared spectroscopy of organic free radicals related to combustion processes.** Weisshaar, J.C. Wisconsin Univ., Madison, WI (United States). Dept. of Chemistry. 25 Feb 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER14306. Order Number DE93017086. Source: OSTI; NTIS; GPO Dep.

We will explore a variant of resonant two-photon ionization (R2PI). Development of the IR + UV R2PI experiment is underway. We have used optical R2PI and pulsed field ionization detection to

obtain vibrational spectra of the benzyl and phenylsilane cations. In benzyl, we have learned about the vibronic coupling in the mixed 1^2A_2-2^2B_2 system near 450 nm by projecting the mixed states onto the manifold of cation vibrational states. In phenylsilane+, we find that the sixfold barrier to internal rotation of the silyl group is small (V_6= +19 cm^{-1}). We are beginning to understand the mechanisms of coupling of torsional states with vibrations, overall rotation, and other electronic states, and we are developing a model of internal rotation in aromatic compounds based on Weinhold's natural resonance theory. 1 tab, 14 refs.

26889 (LBL–33817) **A comparison of one and two dimensional flame quenching: Heat transfer results.** Ezekoye, O.A. (Texas Univ., Austin, TX (United States). Dept. of Mechanical Engineering); Greif, R. Lawrence Berkeley Lab., CA (United States). Mar 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930830–22: National conference and exposition on heat transfer, Atlanta, GA (United States), 8-11 Aug 1993). Order Number DE93015196. Source: OSTI; NTIS; GPO Dep.

A theoretical investigation of laminar premixed flame quenching is carried out. Two orientations in which a flame may contact a cold wall are compared and contrasted by solving the conservation equations of mass, energy, and species utilizing a finite difference methodology. A one-step mechanism is used to specify the reaction rates. A simple analytical model, which is in qualitative agreement with the numerical results, is also presented. The results show that the heat transfer histories for one and two dimensional laminar flame quenching are similar.

26890 (SAND–93-1069C) **Modeling ignition chemistry.** Hobbs, M.L.; Baer, M.R.; Gross, R.J. Sandia National Labs., Albuquerque, NM (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9305189–3: 1993 joint Army, Navy, NASA, Air Force (JANNAF) Propulsion Systems Hazards Subcommittee meeting, Ft. Lewis, WA (United States), 10-14 May 1993). Order Number DE93012340. Source: OSTI; NTIS; GPO Dep.

An eXplosive CHEMical kinetics code, XCHEM was developed to solve the reactive diffusion equations associated with thermal ignition of energetic material. This method-of-lines code uses stiff numerical methods and adaptive meshing. Solution accuracy is maintained between multilayered materials consisting of blends of reactive components and/or inert materials. Phase change and variable properties are included in one-dimensional slab, cylindrical and spherical geometries. Temperature-dependent thermal properties was incorporated and modification of thermal conductivities to include decomposition effects are estimated using solid/gas volume fractions determined by species fractions. Gas transport properties are also included. Time varying temperature, heat flux, convective and thermal radiation boundary conditions, and layer to layer contact resistances are also implemented. The global kinetic mechanism developed at Lawrence Livermore National Laboratory (LLNL) by McGuire and Tarver used to fit One-Dimensional Time to eXplosion (ODTX) data for the conventional energetic materials (HMX, RDX, TNT, and TATB) are presented as sample calculations representative of multistep chemistry. Calculated and measured ignition times for explosive mixtures of Comp B (RDX/TNT), Octol, (HMX/TNT), PBX 9404 (HMX/NC), and RX-26-AF (HMX/TATB) are compared. Geometry and size effects are accurately modeled, and calculations are compared to experiments with time varying boundary conditions. Finally, XCHEM calculations of initiation of an AN/oil/water emulsion, resistively heated, are compared to measurements.

26891 (SAND–93-0567C) **Vibration suppression by modulation of elastic modulus using shape memory alloy.** Segalman, D.J. (Sandia National Labs., Albuquerque, NM (United States)); Parker, G.G.; Inman, D.J. Sandia National Labs., Albuquerque, NM (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9309116–1: Conference on vibration and noise, Albuquerque, NM (United States), 20-22 Sep 1993). Order Number DE93009834. Source: OSTI; NTIS; GPO Dep.

The first portion of this paper proposes a method of fabricating a material whose modulus can be changed substantially through the application of a specified stimulus. The particular implementation presented here indirectly exploits the large deformation associated with shape memory alloys to achieve the desired modulation of stiffness. The next portion of this paper discusses a class of vibration problems for which such materials have a serious potential for vibration suppression. These are problems, such as the spinning up of rotating machinery, in which the excitation at any time lies within a narrow frequency band, and that band moves through the frequency spectrum in a predictable manner. Finally, an example problem is examined and the utility of this approach is discussed.

26892 (ANL/XFD/CP–78973) **Limit analysis of a spherical shell under ring load and the experimental verification.** Zhibi Wang (Argonne National Lab., IL (United States)); Kensun Den; Lingxi Qian. Argonne National Lab., IL (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930702–31: Pressure vessels and piping conference, Denver, CO (United States), 25-29 Jul 1993). Order Number DE93015545. Source: OSTI; NTIS; INIS; GPO Dep.

The upper bound limit theorem has been used here to study the limit load of spherical shell under ring load. A closed form solution for the limit load has been found. A series of experiments was performed with different sizes and different thicknesses of the spherical shell under different diameters of ring loads. Good agreement was found between the theory and the experimental results.

26893 (BNL–49036) **An assessment of the use of CARS for remote sensing.** Barletta, R.E. Brookhaven National Lab., Upton, NY (United States). Apr 1993. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93016736. Source: OSTI; NTIS; GPO Dep.

With the increased interest in controlling the manufacture of chemical weapons (CW) agents globally as well as the interest in controlling the development and spread of nuclear weapons has come a concomitant need for the development instrumentation which will allow for either remote or clandestine surveillance of potential production and transportation facilities. The ability to monitor the effluent of a suspected weapon's production plant from distances on the order of kilometers would provide the basis for treaty verification or for intelligence gathering. A number of potential techniques for accomplishing these ends are currently under development. In particular a technique based upon identification of the constituents of a mixture based upon the vibrational spectrum obtained using Raman spectroscopy is under development. Because this approach has range limitation due to the frequency of light being used for interrogation other methods which can accomplish the same ends even more remotely are of interest. To this end, a review of the appropriate literature has been conducted and the results of this review with respect to the application of coherent anti-Stokes Raman spectroscopy (CARS) to the remote detection of chemicals of interest has been conducted. This study is more limited in scope than a detailed developmental program which is currently being under taken by DESE Research, Inc. and is limited to the question as to whether CARS possesses adequate sensitivity to be used as a remote sensing technique. Since current interest in remote sensing centers around detection of CW production in conjunction with the recently signed international convention in this area, the detection of CW agents and simulants is given prominence in this discussion. The use of CARS for microscopic detection of such controlled materials, while not explicitly considered in this report, is a further application of the technology.

26894 (CBL–41) **Compact reinforced composite basic principles.** Bache, H.H. Aalborg Portland (Denmark). Cement- og Betonlaboratoriet. Apr 1987. 87p. Order Number DE93500157. Source: OSTI; NTIS.

Compact Reinforced Composite - CRC - is a new type of high-performance composite material which is based on strong, brittle matrix materials given a high degree of ductility. The material is particularly suitable for large elements and structures, enabling them to resist very large forced in tension, compression and shear. CRC is reinforced with densely arranged bars and a high concentration of fine fibres. The design strategy principles were to enable brittle matrix materials to strain harden by reinforcing them with a high concentration of fine, strong and stiff fibres - this increases the tensile stresses and tensile strains at which the matrix material cracks, to increase the ultimate tensile strains of the matrix materials when these deform together with the reinforcing bars by effective fixation to the bars, and to achieve a high degree of global and local ductility by means that ensure a small "brittleness number". Bending tests on CRC beams in which the binder consisted of densely packed Portland cement and microsilica in a steel-fibre-reinforced quartz-sand mortar and the main reinforcement was 8 mm diameter steel bars, demonstrated the unique behaviour of the new materials. The load capacity in bending was 5-10 times that of traditional, good reinforced concrete and almost the same as for structural steel, the formalized ultimate bending stress (normalized bending moment: $M/1/6\ bh^2$) being slightly more than 160 MPa. The matrix material remained uncracked under tensile loading right up to the yield limit of the reinforcing steel (tensile strains about 3 mm/m), whereas ordinary reinforced concrete cracks at tensile strains of only 3-5% of the yield limit of the reinforcing steel. (AB) (14 refs.).

26895 (CEA-R–5632) **Decommissioning of the vitrification cell of the Piver plant.** Jouan, A.; Deschaud, C.; Scelo, G. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. Feb 1993. [100p.] (In French). Order Number DE93631011. Source: OSTI; NTIS (US Sales Only); INIS.

This report may be considered as a testament following the decommissioning of the PIVER cell. After a brief historical review, it describes the organization and logistics set up to complete the dismantling work. The conditioning methods in packages, drums, shells or ANDRA waste containers are also described together with the problems that arose during the operation. The final decontamination status of the cell is then specified. The report also describes some Research and Development work conducted using more sophisticated decontamination processes. The cost of the project is discussed, together with a critical review of the overall PIVER decommissioning program.

26896 (DOE/CE/15495–T6) **A novel method for monitoring pipe wall thinning: Final report.** Hopenfeld, J. Hopenfeld (Joram), Rockville, MD (United States). Jun 1993. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-90CE15495. Order Number DE93016265. Source: OSTI; NTIS; GPO Dep.

This report presents results from eight tasks which were formed to demonstrate commercial viability of a new technology for the early detection of corrosion damage. The tasks produced three products which are deployed to commercialize the technology: (1)Experimentally verified software package which allows instrument specification for wall thinning detection. (2) Eighteen months of field experience in the installation and monitoring of radioactive tracers for wall thinning. (3) Technology for environmental and process monitoring, which was not developed under this contract but evolved as a natural extension of the subject invention. Radioactive tracers are deployed to provide early seaming of corrosion attack on pipes and tanks. The results of this project clearly demonstrate that these monitors are ideal for harsh and difficult to access environments. It is believed that no other technology is capable of providing in situ wall thinning data in such environments. The early warning of wall thinning with radioactive tracers will be commercialized via licensing agreements. Power plants and refineries have the capabilities to deploy the technology which was developed and demonstrated under this project. Funds from licensing agreements will be invested in the establishment of a service to conduct the actual monitoring. This service will extend beyond corrosion monitoring to include environmental monitoring. Current environmental regulation and cleanup of polluted sites has created a market for low cost, in-situ, monitoring. Through its ownership of US Patents which offer the most economical means of monitoring vast areas for toxic compounds, the company is in a unique position to profit from the emerging new market. Negotiations are underway with companies with existing sales and distribubon outlets for the formation of joint ventures. Proposals for the ARPA initiative and the DOE/SBIR have been prepared in the area of environmental monitoring.

26897 (DOE/DP/00789–T279) **Test plan: Small scale seal performance tests: Test Series B.** Stormont, J.C. Sandia National Labs., Albuquerque, NM (United States). 18 Nov 1985. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012210. Source: OSTI; NTIS; GPO Dep.

The purpose of this appendix to "Test Plan: Small Scale Seal Performance Tests (SSSPT)" is to provide details regarding the installation and testing of Test Series B. The original test plan provides the technical motivation and test design in general terms for Test Series A through E and the details of the installation and testing of Test Series A. As specified in the test plans operations plans for the remaining test series are to be prepared when the details become available. This is now the case for Test Series B. It is emphasized that the original test plan remains valid and is the general reference for the conduct of all of the test series of the SSSPT. Test Series B will evaluate the performance of horizontally emplaced concrete seals and as such will be a small scale evaluation of the concrete component of the planned panel seal. The objectives of Test Series B are: (1) To develop and evaluate a technique for the horizontal emplacement of a concrete seal; (2) To obtain data on the fluid flow performance of horizontally emplace concrete seal systems; (3) To obtain data on the structural performance of horizontally emplaced concrete seal systems; and (4) To provide data for the development and validation of predictive numerical codes and models.

26898 (EGG–10617-1216) **Survey of subsurface geophysical exploration technologies adaptable to an airborne platform.** Taylor, K.A. EG and G Energy Measurements, Inc., Las Vegas, NV (United States). Remote Sensing Lab. Dec 1992. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. Order Number DE93015080. Source: OSTI; NTIS; INIS; GPO Dep.

This report has been prepared by the US Department of Energy (DOE) as part of a Research Development Demonstration Testing and Evaluation (RDDT&E) project by EG&G Energy Measurement's (EG&G/EM) Remote Sensing Laboratory. It examines geophysical detection techniques which may be used in Environmental Restoration/Waste Management (ER/WM) surveys to locate buried waste, waste containers, potential waste migratory paths, and aquifer depths. Because of the Remote Sensing Laboratory's unique survey capabilities, only those technologies which have been adapted or are capable of being adapted to an airborne platform were studied. This survey describes several of the available subsurface survey technologies and discusses the basic capabilities of each: the target detectability, required geologic conditions, and associated survey methods. Because the airborne capabilities of these survey techniques have not been fully developed, the chapters deal mostly with the ground-based capabilities of each of the technologies, with reference made to the airborne capabilities where applicable. The information about each survey technique came from various contractors whose companies employ these specific technologies. EG&G/EM cannot guarantee or verify the accuracy of the contractor information; however, the data given is an indication of the technologies that are available.

26899 (LA-UR–93-757) **MCNP/KENO criticality benchmarks.** McKinney, G.W. (Los Alamos National Lab., NM (United States)); Wagner, J.C.; Sisolak, J.E. Los Alamos National Lab., NM (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930907–1: ANS topical meeting on physics and methods in criticality safety,

Nashville, TN (United States), 19-23 Sep 1993). Order Number DE93010711. Source: OSTI; NTIS; GPO Dep.

In the past, criticality safety analyses related to the handling and storage of fissile materials were obtained from critical experiments, nuclear safety guides, and handbooks. As a result of rising costs and time delays associated with critical experiments, most experimental facilities have been closed, triggering an increased reliance on computational methods. With this reliance comes the need and requirement for redundant validation by independent criticality codes. Currently, the KENO Monte Carlo transport code is the most widely used tool for criticality safety calculations. For other transport codes, such as MCNP, to be accepted by the criticality safety community as a redundant validation tool they must be able to reproduce experimental results at least as well as KENO. The Monte Carlo neutron, photon, and electron transport code MCNP, has an extensive list of attractive features, including continuous energy cross sections, generalized 3-D geometry, time dependent transport, criticality k_{eff} calculations, and comprehensive source and tally capabilities. It is widely used for nuclear criticality analysis, nuclear reactor shielding, oil well logging, and medical dosimetry calculations. This report specifically addresses criticality and benchmarks the KENO 25 problem test set. These sample problems constitute the KENO standard benchmark set and represent a relatively wide variety of criticality problems. The KENO Monte Carlo code was chosen because of its extensive benchmarking against analytical and experimental criticality results. Whereas the uncertainty in experimental parameters generally prohibits code validation to better than about 1% in k_{eff}, the value of k_{eff} for criticality is considered unacceptable if it deviates more than a few percent from measurements.

26900 (LA-UR–93-758) **New developments enhancing MCNP for criticality safety.** Hendricks, J.S.; McKinney, G.W.; Forster, R.A. Los Alamos National Lab., NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9309120–1: American Nuclear Society meeting, Nashville, TN (United States), 19-23 Sep 1993). Order Number DE93010698. Source: OSTI; NTIS; INIS; GPO Dep.

Since the early 80's MCNP has had three estimates of k_{eff}: collision, absorption, and track length. MCNP has also had collision and absorption estimators of removal lifetime. These are calculated for every cycle and are averaged over the cycles as simple averages and covariance weighted averages. Correlation coefficients between estimators are also calculated. These criticality estimators are all in addition to the extensive summary information and tally edits used in shielding and other problems. A number of significant new developments have been made to enhance the MCNP Monte Carlo radiation transport code for criticality safety applications. These are available in the newly released MCNP4A version of the code.

26901 (LA-UR–93-1717) **Knowledge based systems: From process control to policy analysis.** Marinuzzi, J.G. Los Alamos National Lab., NM (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9305187–2: Ideas in science and electronics, Albuquerque, NM (United States), 11 May 1993). Order Number DE93014582. Source: OSTI; NTIS; GPO Dep.

Los Alamos has been pursuing the use of Knowledge Based Systems for many years. These systems are currently being used to support projects that range across many production and operations areas. By investing time and money in people and equipment, Los Alamos has developed one of the strongest knowledge based systems capabilities within the DOE. Staff of Los Alamos' Mechanical & Electronic Engineering Division are using these knowledge systems to increase capability, productivity and competitiveness in areas of manufacturing quality control, robotics, process control, plant design and management decision support. This paper describes some of these projects and associated technical program approaches, accomplishments, benefits and future goals.

26902 (LA-UR–93-1822) **Anomalous effects of moderation in transportation and storage arrays - revisited.** Yearwood, D. (Los Alamos National Lab., NM (United States)); Clayton, E.D.; Koponen, B.L. Los Alamos National Lab., NM (United States). 10 Mar 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9309120–3: American Nuclear Society meeting, Nashville, TN (United States), 19-23 Sep 1993). Order Number DE93014554. Source: OSTI; NTIS; INIS; GPO Dep.

A number of anomalies have been observed for fissile material arrays. This paper will review anomalous behavior associated with interstitial array moderation and correct one previously-misidentified anomaly. Most arrays show a maximum k_{eff} with low-density water moderation. An earlier study, however, did not show this maximum for unreflected $5\times5\times5$ and $10\times10\times10$ arrays of 15-kg ^{235}U spheres. Our present calculations with MCNP and KENO V.a, however, show low-density maximums for both unreflected and reflected arrays of these units. We conclude that the earlier calculations for unreflected arrays were in error – perhaps due to problem setup or code errors. The reactivity enhancement due to fissile material density reductions, however, still exits and is now seen to occur for both unreflected and water-reflected arrays.

26903 (ORNL/FTR–4270) **Travel to Grenoble, France, to attend and present two papers at the 1992 IEEE international conference on robotics and automation, and to visit three French robotics research laboratories (INRIA, LAAS, and LIFIA): Foreign trip report, May 8–24, 1992.** Pin, F.G. Oak Ridge National Lab., TN (United States). 11 Jun 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011065. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the IEEE International Conference on Robotics and Automation and presented two papers entitled "Design of an Omnidirectional and Holonomic Wheeled Platform Prototype" and "Autonomous Navigation of a Mobile Robot Using Custom-Designed Qualitative Reasoning VLSI Chips and Boards." The traveler also visited the robotics laboratories of the Institut National de Recherche en Informatique et Automatique (INRIA) in Sophia-Antipolis, the Laboratoire d'Automatique et d'Analyse des Systemes (IAAS) in Toulouse, and the Laboratoire d'Informatique Fondamentalle et d'Intelligence Artificielle (LIFIA) in Grenoble.

26904 (ORNL/FTR–4376) **Travel to attend a meeting in Austria to discuss issues related to criticality safety and overpacks in the transport of radioactive material: Foreign trip report, August 30–September 5, 1992.** Parks, C.V. Oak Ridge National Lab., TN (United States). 21 Sep 1992. 84p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012354. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler visited the International Atomic Energy Agency (IAEA) Headquarters to participate in a Consultants Service Meeting (CSM) concerning the provisions for criticality safety and overpacks in the Regulations for the Safe Transport of Radioactive Material. The CSM was organized by the IAEA to consist of nominees from the United States (the traveler), Germany (H. H. Schweer), and the United Kingdom (C. K. Wilson). The agenda for the CSM consisted primarily of identified problems and proposed amendments submitted by IAEA member states. A written report summarizing the discussion and recommendations on each issue was prepared by the consultants and will be submitted to a panel of criticality specialists that will convene at the second Revision Panel meeting for the Regulations to be held May 17–21, 1993.

26905 (RFP–4704) **PRA approach for determining criticality safety operational limits.** Lerum, H.F. II; Patlovany, R.W. EG and G Rocky Flats, Inc., Golden, CO (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. (CONF-9306143–9: Energy Facility Contractors Group safety analysis meeting, Denver, CO (United States), 16-18 Jun 1993). Order Number DE93015419. Source: OSTI; NTIS; INIS; GPO Dep.

26906 (SAND–92-2825C) **Three-dimensional shock wave physics simulations with MIMD PAGOSA on massively parallel computers.** Gardner, D.R. (Sandia National Labs., Albuquerque, NM (United States)); Vaughan, C.T.; Cline, D.D. Sandia National

Labs., Albuquerque, NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930765–3: SCSC '93: summer computer simulation conference, Boston, MA (United States), 19-21 Jul 1993). Order Number DE93011682. Source: OSTI; NTIS; GPO Dep.

The numerical modeling of penetrator-armor interactions for design studies requires rapid, detailed, three-dimensional simulation of complex interactions of exotic materials at high speeds and high rates of strain. To perform such simulations, we have developed a multiple-instruction, multiple-data (MIMD) version of the PAGOSA hydrocode. The code includes a variety of models for material strength, fracture, and the detonation of high explosives. We present a typical armor/antiarmor penetration simulation conducted with this code, and measurements of its performance. The scaled speedups for MIMD PAGOSA on the 1024-processor nCUBE 2 parallel computer, measured as the simulation size is increased with the number of processors, reveal that small grind times (computational time per cell per cycle) and parallel scaled efficiencies of 90% can be achieved for realistic problems. This simulation demonstrates that massively parallel hydrocodes can provide rapid, highly-detailed armor/antiarmor simulations.

26907 (SAND–93-0304C, pp. 4, Paper 2) **Quantitative STM and AFM studies of the evolution of interface roughness.** Williams, R.S.; Tong, W.M. Sandia National Labs., Albuquerque, NM (United States). [1993]. (CONF-921101–108: 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting, Boston, MA (United States), 30 Nov - 5 dec 1992). In *Interface roughness: What is it and how is it measured?*. 35p. Order Number DE93009797. Source: OSTI; NTIS.

All modern theories of the kinetics of solid growth or etching using gas phase reactants predict that the surface will evolve into a rough morphology as the growth proceeds outward or the etching proceeds inward. This section presents a brief tutorial on how to obtain extremely accurate three-dimensional topographs of surfaces at various stages in the growth or etching process using STM (scanning tunneling microscopy) or AFM (atomic force miscoscopy) measurements. Methods of analyzing collected data are discussed. Also discussed are some of the strengths and weaknesses of the techniques and analysis.

26908 (SAND–93-1011) **Center of trace algorithms for extracting digitized waveforms from two-dimensional images.** Lee, J.W. Sandia National Labs., Albuquerque, NM (United States). May 1993. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93015082. Source: OSTI; NTIS; GPO Dep.

A class of recording instruments records high-frequency signals as a two-dimensional image rather than converting the analog signal directly to digital output. This report explores the task of reducing the two-dimensional trace to a uniformly sampled waveform that best represents the signal characteristics. Many recorders provide algorithms for locating the center of trace. The author discusses these algorithms and alternative algorithms, comparing their effectiveness.

26909 (UCRL–52000-93-3) **Energy and Technology Review, March 1993.** Sefcik, J.A.; Quirk, W.J. (eds.). Lawrence Livermore National Lab., CA (United States). 1993. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013941. Source: OSTI; NTIS; GPO Dep.

The Lawrence Liver National Laboratory was established in 1952 to research on nuclear weapons and magnetic fusion energy. Since then, we have added other major programs, including fusion and laser isotope separation, biomedical and environmental science, strategic defense, and applied energy technology. These programs, in turn, require research in basic scientific disciplines, including chemistry and materials science, computer science and technology, engineering, and physics. This review is published monthly to report on unclassified work in all of our programs. This issue describes three endeavors. We have developed a multiple-frame, laser-illuminated, electro-optic camera system that produces sequential photographs of fast phenomena, such as the formation of shaped-charge jets, with unprecedented high resolution. Another project concerns a new rocket propulsion system for small spacecraft. This liquid rocket propulsion system won a 1992 R&D 100 award and features miniature pumps that can turn on and off and can change speed within a millisecond to meet a wide range of thrust requirements. The last project reported on pertains to computational integrated photonics: using numerical simulation to optimize photonic devices.

26910 (UCRL-CR–105013) **Final report for Allied-Signal Aerospace Company, Kansas City Division on protective glove permeation analysis.** Swearengen, P.M. (Lawrence Livermore National Lab., CA (United States)); Johnson, J.S.; Priante, S.J. Lawrence Livermore National Lab., CA (United States); Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. 22 Jun 1990. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93009541. Source: OSTI; NTIS; INIS; GPO Dep.

We conducted 25 separate glove fabric permeation studies during this project. The permeations were carried out in the small (1 inch) glass ASTM cell. One other permeation study was carded out with a large (two inch) modified ASTM cell for comparison with the small cell results. We also compared the LLNL procedure from both large and small cells with the standard ASTM test procedure which uses a liquid solution on the breakthrough side of the fabric (the liquid is then sampled on a periodic basis). In all comparisons we observed a close-correlation in breakthrough times between the two procedures and the two cell sizes. In the course of this study, we tested ten different glove materials. These included neoprene (original ASTM round-robin sheet stock, 16 mil thickness), Edmont Sol-Vex (nitrile), Pioneer nitrile, Pioneer Pylox (polyvinyl chloride), North Viton (trademark for fluoroelastomers), North SilverShield (Norfoil, trademark for a flexible metallized laminate), Safety 4 4H (patented plastic laminate), and QRP PolyTuff (polyurethane) 20G-2000 (5 mil), 23G-2300 (1.5 mil), and 25G-2500 (1.5 mil). Three of the glove materials, Viton and Silver Shield (North), and 4H (Safety 4), did not allow any permeation measurable by our system to either 1,2-dichloroethane or 3% diphenylmercury (in 1,2-dichloroethane) for a period greater than six hours. A fourth material, QRP Poly Tuff 2OG-2000, did not allow any measurable penetration of Asilamine (an aromatic diamine) for a time pedod of greater than 4 hours. Breakthrough times and curves were obtained for all other tested materials. Eleven different chemicals were used to challenge the glove materials. These included acetone, Asilamine, 1,2-dichloroethane, dichloromethane, isopropyl alcohol, a mixture of 3% diphenylmercury in 1,2-dichloroethane (w/w), phenol, and Iso Verre Stripper, 4,4'-methylenedianil (MDA), 1,3-phenylenediamine (MPDA), and Shell Epon (R) curing agent Z.

26911 (UCRL-ID–107864) **Environmental hardening of equipment operating in an automated test bed enclosure: Special Isotope Separation Program (SIS).** Hayward, M.L. Lawrence Livermore National Lab., CA (United States). Dec 1990. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014829. Source: OSTI; NTIS; GPO Dep.

Lawrence Livermore National Laboratory's Plutonium Systems Engineering plans to demonstrate a materials handling system in an automated test bed located in the cold test facility, in FY91. The equipment operating in the automated glove box test bed consists of a modified, bridge mounted robot that is electrically driven, robot tooling, a tilt-pour furnace, mechanisms for loading and unloading the furnace, mechanisms for loading and unloading the crucible, and mechanisms for button breakout and can opening. Each of the pieces of equipment mentioned have components such as motors (with or without brushes), bearings, resolvers, encoders, sliding surfaces, cabling, and electrical connectors that must function in the harsh environment of the test bed enclosure, and each of the components described must be hardened to the enclosure environment. The automated test bed is to provide a representation of a weapons-grade plutonium enclosure. Although the decision to operate the enclosure in a nitrogen or argon atmosphere has not been made, this report considers the dry argon atmosphere as the more difficult case. Other environmental requirements on the equipment operating in the test bed enclosure are: Low moisture

and low oxygen atmosphere, and some abrasive dust resulting from the process. A surrogate material will provide flow and dusting characteristics of weapons-grade plutonium oxide. Weapons-grade plutonium will not be introduced into the test bed enclosure. However, for future reference, radiation effects on materials are addressed.

26912 (UCRL-ID–114502) **Testing of CFC replacement fluids for arc-induced toxic by-products.** Cravey, W.R.; Goerz, D.A.; Hawley-Fedder, R.A. Lawrence Livermore National Lab., CA (United States). Jun 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93017094. Source: OSTI; NTIS; GPO Dep.

The authors have developed a unique test-stand for quantifying the generation of perfluoroisobutylene (PFIB) in chlorofluorocarbon (CFC) replacement fluids when they are subjected to high electrical stress/breakdown environments. PFIB is an extremely toxic gas with a threshold limit value of 10 ppbv as set by the American Conference of Governmental Industrial Hygienists. They have tested several new fluids from various manufacturers for their potential to generate PFIB. Their goal is to determine breakdown characteristics and quantify toxic by-products of these replacement fluids to determine a safe, usable alternative for present CFC's.

26913 (UCRL-JC–108924) **Slidesurfaces with Adaptive New Definitions (SAND) for transient analysis.** Whirley, R.G.; Engelmann, B.E. Lawrence Livermore National Lab., CA (United States). 2 Jun 1992. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921110–50: Winter annual meeting of the American Society of Mechanical Engineers (ASME), Anaheim, CA (United States), 8-13 Nov 1992). Order Number DE93014909. Source: OSTI; NTIS; GPO Dep.

This paper describes some recent developments in adaptive contact algorithms for the transient analysis of penetration and material failure. A failure criterion is defined for volumes of potentially failing material on each side of a contact surface. As material within an element fails, the element is removed from the calculation and the contact surface is adaptively redefined to include the newly exposed outer material boundary. This contact algorithm admits arbitrary combinations of shell and solid elements to facilitate the representation of composite or honeycomb structures. The algorithms and their application are illustrated with several large-scale simulations using the explicit transient analysis code DYNA3D.

26914 (UCRL-JC–110007) **Training end-users: An on-line help package.** Waite, M. Lawrence Livermore National Lab., CA (United States). Mar 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9205138–4: North American Ingres Users Association (NAIUA) meeting, Tarpan Springs, FL (United States), May 1992). Order Number DE93015105. Source: OSTI; NTIS; GPO Dep.

No matter how wonderful your INGRES application, if the end users don't know how to use the application it will not be utilized. This paper discusses an on-line help package implemented in our manufacturing database application in order to help our user community use the application. The Materials Fabrication Division (MFD) of Mechanical Engineering is a series of machining shops that do production jobs for the Laboratory. The Fabrication Control System (FCS) is the user interface to an INGRES database. FCS tracks jobs as they traverse the machine shops and FCS maintains the employee payroll. This interface consists of VIFRED forms, menus and EQUEL Fortran code. The on-line help package is an interactive system that responds to the users "single key stroke" request for information. The information retrieved is based upon which help key is used and the form or menu from which the request is generated.

26915 (UCRL-JC–110265) **Measurements of experimental plasma brush behavior in hybrid armatures.** Hawke, R.S.; Morrison, J.J.; Susoeff, A.R. Lawrence Livermore National Lab., CA (United States). Apr 1992. 7p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9204102–10: 6. symposium on electromagnetic launch technology, Austin, TX (United States), 28-30 Apr 1992). Order Number DE93014993. Source: OSTI; NTIS; GPO Dep.

Hybrid Armatures used in railguns, consist of a conducting link which is commutated to the rails by plasma brushes. The formation, properties and stability of plasma brushes is important to the performance of the armature. This paper describes a set of experiments in which the effects of varying plasma brush parameters including the initial mass of metal foil used to form the plasma as well as the current were studied. The evolution of the plasma brush from a solid metal foil through its melt, vapor and plasma phase were observed. The resulting brush length and voltage drop were measured. The results of these tests will be presented, discussed and compared to numerical simulations.

26916 (WHC-SA–1719) **Nuclear Criticality Technology and Safety Project parameter study database.** Toffer, H. (Westinghouse Hanford Co., Richland, WA (United States)); Erickson, D.G.; Samuel, T.J.; Pearson, J.S. Westinghouse Hanford Co., Richland, WA (United States). Mar 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930907–3: ANS topical meeting on physics and methods in criticality safety, Nashville, TN (United States), 19-23 Sep 1993). Order Number DE93011284. Source: OSTI; NTIS; INIS; GPO Dep.

A computerized, knowledge-screened, comprehensive database of the nuclear criticality safety documentation has been assembled as part of the Nuclear Criticality Technology and Safety (NCTS) Project. The database is focused on nuclear criticality parameter studies. The database has been computerized using dBASE III Plus and can be used on a personal computer or a workstation. More than 1300 documents have been reviewed by nuclear criticality specialists over the last 5 years to produce over 800 database entries. Nuclear criticality specialists will be able to access the database and retrieve information about topical parameter studies, authors, and chronology. The database places the accumulated knowledge in the nuclear criticality area over the last 50 years at the fingertips of a criticality analyst.

26917 (WSRC-MS–93-167) **Design rules under development by ASME B and PV Subgroup on Containment Systems for Spent Fuels and High Level Waste Transport Packagings.** Eggers, A.G. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930702–17: Pressure vessels and piping conference, Denver, CO (United States), 25-29 Jul 1993). Order Number DE93011787. Source: OSTI; NTIS; INIS; GPO Dep.

The ASME Boiler and Pressure Vessel Code group designated as the Subgroup on Containment Systems for Spent Fuel and High Level Waste Packagings (SG-NUPACK) has developed a draft Code for containment components currently designated as Section III, Division 3 of the ASME Boiler and Pressure Vessel Code (Reference 1). There are four working groups under the main NUPACK subgroup that are responsible for various portions of the new Code. These are the Working Group on General Requirements, the Working Group on Material, the Working Group on Design and the Working Group on Fabrication and Examination. There are approximately 40 volunteers from industry (the US and Canada), universities, national laboratories and the NRC actively forging a consensus standard that will become the basis against which packaging containment will be evaluated. This paper provides a summary of the current draft design rules and a comparison of these rules with design criteria currently in use by the packaging community.

26918 (ANL/MCT/CP–78185) **Implementation of an anisotropic turbulence model in the COMMIX- 1C/ATM computer code.** Bottoni, M.; Chang, F.C. Argonne National Lab., IL (United States). [1993]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930702–38: Pressure vessels and piping conference, Denver, CO (United States), 25-29 Jul 1993). Order Number DE93015541. Source: OSTI; NTIS; INIS; GPO Dep.

The computer code COMMIX-1C/ATM, which describes single-phase, three-dimensional transient thermofluiddynamic problems, has provided the framework for the extension of the standard k-ε turbulence model to a six-equation model with additional transport equations for the turbulence heat fluxes and the variance of temperature fluctuations. The new, model, which allows simulation of anisotropic turbulence in stratified shear flows, is referred to as the Anisotropic Turbulence Model (ATM) has been verified with numerical computations of stable and unstable stratified shear flow between parallel plates.

26919 (BNL–48897) **Two-phase flow instability and dryout in parallel channels in natural circulation.** Duffey, R.B. (Brookhaven National Lab., Upton, NY (United States)); Rohatgi, U.S.; Hughes, E.D. Brookhaven National Lab., Upton, NY (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930830–20: National conference and exposition on heat transfer, Atlanta, GA (United States), 8-11 Aug 1993). Order Number DE93014293. Source: OSTI; NTIS; GPO Dep.

The unique feature of parallel channel flows is that the pressure drop or driving head for the flow is maintained constant across any given channel by the flow in all the others, or by having a large downcomer or bypass in a natural circulation loop. This boundary condition is common in all heat exchangers, reactor cores and boilers, it is well known that the two-phase flow in parallel channels can exhibit both so-called static and dynamic instability. This leads to the question of the separability of the flow and pressure drop boundary conditions in the study of stability and dryout. For the areas of practical interest, the flow can be considered as incompressible. The dynamic instability is characterized by density (kinematic) or continuity waves, and the static instability by inertial (pressure drop) or manometric escalations. The static has been considered to be the zero-frequency or lowest mode of the dynamic case. We briefly review the status of the existing literature on both parallel channel static and dynamic instability, and the latest developments in theory and experiment. The difference between the two derivations lies in the retention of the time-dependent terms in the conservation equations. The effects and impact of design options are also discussed. Since dryout in parallel systems follows instability, it has been traditional to determine the dryout power for a parallel channel by testing a single channel with a given (inlet) flow boundary condition without particular regard for the pressure drop. Thus all modern dryout correlations are based on constant or fixed flow tests, a so-called hard inlet, and subchannel and multiple bundle effects are corrected for separately. We review the thinking that lead to this approach, and suggest that for all multiple channel and natural circulation systems close attention should be paid to the actual (untested) pressure drop conditions. A conceptual formulation is suggested as a basis for discussion.

26920 (CONF-9209344–1) **On the motion through a viscous fluid of a spherical particle touching a plane wall: Slip boundary conditions.** Davis, A.M.J.; Kezirian, M.T.; Brenner, H. Massachusetts Inst. of Tech., Cambridge, MA (United States). Dept. of Chemical Engineering. [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER13896. From 3. international symposium on current problems in rheology, biorheology and biomechanics; Moscow (Russian Federation); 1-5 Sep 1992. Order Number DE93012540. Source: OSTI; NTIS; GPO Dep.

Understanding the hydrodynamic forces acting upon immersed particles touching surfaces, is of central importance in clean room technology and a variety of rheological and biological applications. This paper addresses the translation and rotation of a sphere translating and rotating parallel to a nearby plane wall bounding an otherwise quiescent semi-infinite viscous fluid, allowing for slip on the wall and/or the sphere. The motivation for disregarding the classical, no-slip boundary condition on solid surfaces aries from an embarrassing discrepancy between theoretical and observed predictions of the translational velocity of a sphere 'rolling' under the influence of gravity down an inclined plane bounding an effectively semi-infinite viscous fluid. According to theory the force and torque on a translating and/or rotating sphere moving parallel to the plane wall become logarithmically infinite with the gap width as the gap between the sphere and well goes to zero. As such, the theoretical conclusion is that the sphere cannot translate down the plane, despite the gravity force that acts to animate it. Experiments, however, reveal that the sphere does, in fact, roll down the plane - at a reproducible mean terminal velocity. In the noninertial, small Reynolds number limit, the experimentally observed drag coefficient was found to be about 8.9 times that given by Stokes law for the unbounded case - thereby suggesting a conventional hydrodynamic wall effect, rather than the logarithmically singular behavior predicted by the theory. It was in an attempt to resolve this glaring contradiction that we have elected here to examine the possible effects of slip.

26921 (DOE/METC/C–93/7067) **Time-averaged hydrodynamic equations of fluidization.** O'Brien, T.J. (USDOE Morgantown Energy Technology Center, WV (United States)); Syamlal, M.; Nicoletti, P.; Celik, I. USDOE Morgantown Energy Technology Center, WV (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). (CONF-930830–18: National conference and exposition on heat transfer, Atlanta, GA (United States), 8-11 Aug 1993). Order Number DE93013483. Source: OSTI; NTIS; GPO Dep.

A set of hydrodynamic equations proposed by Jackson described fluidized beds as interacting continua. Using either the theory of statistical mechanics or continuum mechanics, the granular material was represented as a continuum (or as many continua) which interacted with the interpenetrating fluidizing medium. The equations for each phase are formally similar to the familiar Navier-Stokes equations for a single fluid, except that there are interaction terms between the phases and the density of each phase is replaced by an effective density, the product of its intrinsic density and the volume fraction occupied by that phase. These equations have formed the basis of a hydrodynamic theory of fluidization. Since these equations are a coupled set of transient, multidimensional, partial differential equations, their solution requires extensive computational effort simplifying assumptions are made. The dimensionality of the equations is reduced to 1-D and/or the transient terms are dropped. In the former case, recirculation, which is an essential feature of the granular motion, can not be described. In the latter case, the fluctuating behavior. The purpose of this paper is to present time-steady hydrodynamic equations which still capture the effects of this essential aspect of fluidized-bed behavior. The obvious advantage is that the solution of time-steady equations is computationally more efficient than the calculation of a long time record, by solving the transient equations, and then calculating its time average. The disadvantage is that the effect of fluctuations must be accounted for by additional terms in the time-steady equations, which must be determined a priori. Time-steady equations, derived by merely dropping the transient term, neglect all (nonlinear) effects of bed fluctuations, which are a salient feature of the bed dynamics.

26922 (DOE/PETC/TR–93/2) **Flow of granular materials down an inclined plane.** Gudhe, R. (Pittsburgh Univ., PA (United States). Dept. of Mechanical Engineering); Rajagopal, K.R.; Massoudi, M.; Chi, R. USDOE Pittsburgh Energy Technology Center, PA (United States). May 1993. 31p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93013901. Source: OSTI; NTIS; GPO Dep.

The mechanics of flowing granular materials such as coal, sand, fossil-fuel energy recovery, metal ores, etc., and their flow characteristics have received considerable attention in recent years because it has relevance to several technological problems. In a number of instances these materials are also heated prior to processing, or cooled after processing. The governing equations for the flow of granular materials taking into account the heat transfer mechanism are derived using the continuum model proposed by Rajagopal and Massoudi (1990). For a fully developed flow of granular materials down an inclined plane, these equations reduce to a system of coupled ordinary differential equations. The resulting boundary value problem is solved numerically and the results are presented. For a special case, it is possible to obtain an analytic solution; this is given in the Appendix A of this report.

26923 (INIS-mf–12758, pp. 67-71) **Revision of nucleated boiling mechanisms.** Converti, J. (Comision Nacional de Energia

Atomica, San Carlos de Bariloche (Argentina). Centro Atomico Bariloche); Balino, J.L. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The boiling occurrence plays an important role in the power reactors energy transfer. But still, there is not a final theory on the boiling mechanisms. This paper presents a critical analysis of the most important nucleated boiling models that appear in literature. The conflicting points are identified and experiments are proposed to clear them up. Some of these experiments have been performed at the Thermohydraulics laboratory (Bariloche Atomic Center). (Author).

26924 (INIS-mf–12758, pp. 72-76) **Density waves instabilities in two phases flux parallel channels.** Guido Lavalle, G. (Comision Nacional de Energia Atomica, San Carlos de Bariloche (Argentina). Centro Atomico Bariloche); Converti, J.; Clausse, A. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

An analysis to study the stability of a boiling parallel channels system is presented. The channels are represented by variables control volumes. An autovalues problem, whose solutions set up the flux stability, is obtained as result. An identical channels system response is analyzed. From this case, through the parameters perturbation theory, the stability condition and the asymmetric channels oscillation modes were found out. The importance of this original method is based on the possibility of obtaining analytic expressions which are very useful for systems design with two phase flux and which allow a better physical phenomenon interpretation. (Author).

26925 (INIS-mf–12758, pp. 77-83) **Study of the influence of sub-cooled boiling in natural convection.** Etchepareborda, A. (Comision Nacional de Energia Atomica, San Carlos de Bariloche (Argentina). Centro Atomico Bariloche); Clausse, A. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

The circulation regime by natural convection is important as regards the abnormal conditions analysis or accidents in nuclear installations. In cases in which the heat flow is high, steam in subcooled liquid (subcooled boiling) may occur, thus affecting substantially the natural convection mechanism. This work presents a study of the subcooled boiling influence in a natural convection system. The effects of flows and temperatures, for various geometries, are analyzed. The possible effects of the dynamics of the system are also discussed. (Author).

26926 (INIS-mf–12758, pp. 84-88) **Influence of the inertia and gravity on the boiling flows stability.** Delmastro, D.F. (Comision Nacional de Energia Atomica, San Carlos de Bariloche (Argentina). Centro Atomico Bariloche); Clausse, A. Asociacion Argentina de Tecnologia Nuclear, Buenos Aires (Argentina). 1987. [735p.] (In Spanish). (CONF-8711355–: 15. scientific meeting and 4th Latin American meeting and 1st sessions on nuclear power plants, San Carlos de Bariloche (Argentina), 2-6 Nov 1987). In *Proceedings of the fifteenth scientific meeting; fourth Latin American meeting; first sessions on nuclear power plants.* Order Number DE91003052. Source: OSTI; NTIS (US Sales Only); INIS.

A study of boiling flows stability on the basis of a linear analysis is presented. From the homogeneous flows' conservation equations, a distributed parameters model, which allows to deal with the frequency field system, is obtained. The adimensional parameters which characterize the inertia effects and the gravity on the impulse equation, are identified. On the other hand, a mean volumes model which permits to gather analytic criteria helpful for the design and comprehension of the problem is developed. (Author).

26927 (JAERI-M–93-029) **Thermal property correlation package of hydrogen, carbon monoxide, carbon dioxide and methane.** Hada, Kazuhiko (Japan Atomic Energy Research Inst., Oarai, Ibaraki (Japan). Oarai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 106p. (In Japanese). Order Number DE93508333. Source: OSTI; NTIS; INIS.
